Overview

The *Commands Manual* provides a description of all commands used in the EAGLE 5 Integrated Signaling System (ISS) and LNP. The EAGLE 5 ISS includes the IP⁷ Secure Gateway and the IP⁷ Front End. The use of the term “the system” indicates that the information is common to all of the functions of the EAGLE 5 ISS. Differences are indicated for the specific product, as appropriate.

NOTE: The IP⁷ Front End configuration is a stand-alone single-shelf IP⁷ Secure Gateway. When using this manual, consider IP⁷ Front End and IP⁷ Secure Gateway as functional equivalents with the IP⁷ Front End limited to a single shelf configuration.

Commands are entered at a terminal to perform system operations such as displaying the system status, administering system security, and maintaining the database. Error messages are displayed to provide information about problems encountered when a command is entered.

Scope and Audience

This manual is intended for those who maintain and do database administration on the Tekelec Signaling Products and LNP. It is assumed that the user is familiar with the SS7 network and its associated protocols. The manual describes commands used in the system, and it contains a special section on debug commands and their descriptions.

Debug commands are a special group of commands used in troubleshooting and debugging the system. These commands are intended for Customer Care Center personnel and authorized engineering personnel in the operating companies. The use of these commands is restricted to those personnel who have access to the “Debug” command class.

Manual Organization

Table 1-1 shows how this manual is organized.

NOTE: Throughout this manual, reference to the OAP (Operation System Support Application Processor) applies also to the EOAP (Enhanced Operation System Support Application Process).

Table 1-1. Manual Organization

Chapter Number and Title	Description
Chapter 1, "Introduction"	The organization of this manual The audience References to other Tekelec documentation Customer assistance Documentation packaging, delivery, and updates Safety admonishments
Chapter 2, "Alphabetical List of Commands"	An alphabetical list of the system commands and the corresponding page number for each command description in this manual
Chapter 3, "Commands Listed by Class"	List of the system commands arranged by command class
Chapter 4, "Using Commands"	Descriptions of system terminals, printers, MASP cards, and MDAL cards Keyboard functions Command class administration Definitions of types of command output and messages Procedures for logging into and logging out of the system
Chapter 5, "Commands"	Descriptions of the commands used in the system
Chapter 6, "Debug Commands"	Descriptions of debug commands used in troubleshooting and debugging the system
Chapter 7, "Pass-Through Commands"	Descriptions of the command strings used within the pass command to gather card- and application-specific information
Appendix A, "Reference Information"	Information that is referred to in more than one command description (including signaling link ports, point code formats

Table 1-1. Manual Organization

Chapter Number and Title	Description
	and usage rules, device status, loopback testing, and ISUP Normalization Variants) How to convert an ITU national point code from the format specified by the chg-stpopts:npcfnti parameter into a single number so that it can be used by gateway screening. Summary of loopback testing functions
Appendix B, "Acronyms and Abbreviations"	List of acronyms and abbreviations used in the document

Documentation Admonishments

Admonishments are icons and text that may appear in this and other Tekelec manuals. Admonishments alert the reader to assure personal safety, to minimize possible service interruptions, and to warn of the potential for equipment damage.

The following admonishments, listed in descending order of priority, are used in Tekelec manuals.

TOPPLE: This icon and text indicate the possibility of equipment damage and personal injury from toppling.

DANGER: This icon and text indicate the possibility of *personal injury*.

WARNING: This icon and text indicate the possibility of *equipment damage*.

CAUTION: This icon and text indicate the possibility of *service interruption*.

Customer Care Center

The Tekelec Customer Care Center is your initial point of contact for all product support needs. A representative takes your call or email, creates a Customer Service Request (CSR) and directs your requests to the Tekelec Technical Assistance Center (TAC). Each CSR includes an individual

tracking number. Together with TAC Engineers, the representative will help you resolve your request.

The Customer Care Center is available 24 hours a day, 7 days a week, 365 days a year, and is linked to TAC Engineers around the globe.

Tekelec TAC Engineers are available to provide solutions to your technical questions and issues 7 days a week, 24 hours a day. After a CSR is issued, the TAC Engineer determines the classification of the trouble. If a critical problem exists, emergency procedures are initiated. If the problem is not critical, normal support procedures apply. A primary Technical Engineer is assigned to work on the CSR and provide a solution to the problem. The CSR is closed when the problem is resolved.

Tekelec Technical Assistance Centers are located around the globe in the following locations:

Tekelec - Global

Email (All Regions): support@tekelec.com

- USA and Canada

Phone:

1-888-FOR-TKLC or 1-888-367-8552 (toll-free, within continental USA and Canada)

1-919-460-2150 (outside continental USA and Canada)

TAC Regional Support Office Hours:

8:00 a.m. through 5:00 p.m. (GMT minus 5 hours), Monday through Friday, excluding holidays

- Central and Latin America (CALA)

Phone:

USA access code +1-800-658-5454, then 1-888-FOR-TKLC or 1-888-367-8552 (toll-free)

TAC Regional Support Office Hours (except Brazil):

10:00 a.m. through 7:00 p.m. (GMT minus 6 hours), Monday through Friday, excluding holidays

- Argentina

Phone:

0-800-555-5246 (toll-free)

- Brazil

Phone:

0-800-891-4341 (toll-free)

TAC Regional Support Office Hours:

8:30 a.m. through 6:30 p.m. (GMT minus 3 hours), Monday through Friday, excluding holidays

- Chile

Phone:

1230-020-555-5468

 - TAC Regional Support Office Hours:
 - 9:00 a.m. through 6:00 p.m. (GMT plus 8 hours), Monday through Friday, excluding holidays

Related Publications

The *Commands Manual* is part of and refers to several of the manuals in the EAGLE 5 ISS documentation set. The manuals are listed and described in the *Related Publications* manual, which

is included in the *Release Documentation* on the DVD and is published separately on the Customer Support web site:

Documentation Packaging, Delivery, and Updates

Customer documentation is provided with each system in accordance with the contract agreements. It is updated whenever significant changes that affect system operation or configuration are made. Updates may be issued as an addendum, or a reissue of the affected documentation.

The document part number appears on the title page along with the current revision of the document and the date of publication. The bottom of each page contains the document part number and date of publication.

Two types of releases are major software releases and maintenance releases. Maintenance releases are issued as addenda with a title page and change bars. On the changed pages, the date and document part number are changed. On any unchanged pages that accompany the changed pages, the date and document part number is unchanged.

When the software release has a minimum effect on documentation, we provide an addendum. The addendum provides an instruction page, a new title page, a change history page, and replacement chapters with the date of publication, the document part number, and change bars.

If a new release has a major impact on documentation, such as a new feature, the entire documentation set is reissued with a new part number and a new release number.

Locate Product Documentation on the Customer Support Site

Access to Tekelec's Customer Support site is restricted to current Tekelec customers only. This section describes how to log into Tekelec's Customer Support site and locate a document. Viewing the document requires Adobe Acrobat Reader, which can be downloaded at www.adobe.com.

1. Log into Tekelec's new Customer Support site at support.tekelec.com . NOTE: If you have not registered for this new site, click the Register Here link. Have your customer number available. The response time for registration requests is 24 to 48 hours.
2. Click the Product Support tab.
3. Use the Search field to locate a document by its part number, release number, document name, or document type. The Search field accepts both full and partial entries.
4. Click a subject folder to browse through a list of related files.
5. To download a file to your location, right-click the file name and select Save Target As.

NOTE: Customers may print a reasonable number of each manual for their own use.

Alphabetical List of Commands

Introduction

This chapter contains an alphabetical list of the Tekelec Signaling Products (Eagle STP, IP⁷ Secure Gateway, and IP⁷ Front End) commands and the page number where each command is described in this manual.

Commands Listed by Class

Introduction

This chapter provides lists of the available non-configurable command classes and an alphabetical list of the commands allowed in each class. The command class Basic is automatically given to all users and terminals as a default.

Basic

act-echo.....	5-4
act-user.....	5-28

Using Commands

Introduction

This chapter provides the following information:

- A description of the system's Maintenance and Administration Subsystem
- A description of the system's input and output devices
- A description of how to enter commands
- The procedures for logging into and out of the system

This chapter is intended to assist personnel responsible for the system.

Maintenance and Administration Subsystem

The Maintenance and Administration Subsystem (MAS) is the central management point for the EAGLE 5 ISS. The MAS provides user interface, maintenance communication, peripheral services, alarm processing, system disk interface, and measurements. Management and redundancy is provided by use of two separate subsystem processors.

The MAS resides on two separate sets of Maintenance and Administration Subsystem Processor (MASP) cards and a Maintenance Disk and Alarm card (collectively referred to as control cards). The control cards are located in slots 1113 through 1118 of the EAGLE 5 ISS Control Shelf. The control cards can be either E5-based cards or legacy cards.

NOTE: During normal operation, the E5-based control cards and legacy control cards cannot be mixed in one EAGLE 5 ISS control shelf.

Legacy Control Cards

The legacy set of EAGLE 5 ISS control cards consists of the following cards:

- Two MASP card sets; each set contains two cards:
 - A General Purpose Service Module II card
 - A Terminal Disk Module card

- One Maintenance Disk and Alarm (MDAL) card

General Purpose Service Module II (GPSM-II) Card

Each GPSM-II card contains the Communications Processor and the Applications Processor and provides connections to the IMT bus. The card controls the maintenance and database administration activity and performs both application and communication processing. GPSM-II cards are located in slots 1113 and 1115 of the control shelf.

Terminal Disk Module (TDM) Card

Each TDM card provides the Terminal Processor for the 16 I/O ports, and interfaces to the Maintenance Disk and Alarm (MDAL) card. The TDM card also distributes Composite Clocks and High Speed Master clocks throughout the EAGLE 5 ISS, and distributes Shelf ID to the EAGLE 5 ISS. Each TDM card contains one fixed drive that is used to store primary and backup system databases, measurements, and Generic Program Loads (GPLs). The TDM cards are located in slots 1114 and 1116 of the control shelf.

Maintenance Disk and Alarm (MDAL) Card

The MDAL card processes alarm requests and provides fan control. There is only one MDAL card in a control card set. Critical, major, and minor system alarms are provided for up to 6 individual frames. In addition to the 3 system alarms, the E5-MDAL card provides the system audible alarm. The E5-MDAL card provides control of fans on a per-frame basis and allows for each fan relay to be set individually. The MDAL card contains a removable cartridge drive; the cartridge is used for installing new software; backing up the system software, the application software, and the database; and for downloading data for off-line processing. The MDAL card is located in slots 1117 and 1118 of the control shelf.

E5-based Control Cards

The E5-based set of EAGLE 5 ISS control cards consists of the following cards:

- Two Maintenance and Administration Subsystem Processor cards (E5-MASP cards). Each dual-slot E5-MASP card is made up of two modules:
 - Maintenance Communication Application Processor (E5-MCAP) card
 - Terminal Disk Module (E5-TDM) card
- One Maintenance Disk and Alarm card (E5-MDAL card)

Maintenance Communication Application Processor (E5-MCAP) Card

The E5-MCAP card contains the Communications Processor and Applications Processor and provides connections to the IMT bus. The card controls the maintenance and database administration activity and performs both application and communication processing. E5-MCAP cards are located in slots 1113 and 1115 of the control shelf.

Each E5-MCAP card contains one latched USB port for use with removable flash media (“thumb drive”), and one flush-mounted USB port for use with a plug-in “credit card” flash drive. The removable media drive is used to install and back up customer data. The credit card drive is used for upgrade and could be used for disaster recovery.

Terminal Disk Module (E5-TDM) Card

The E5-TDM card provides the Terminal Processor for the 16 I/O ports, and interfaces to the Maintenance Disk and Alarm (E5-MDAL) card and fixed disk storage. The E5-TDM card also distributes Composite Clocks and High Speed Master clocks throughout the EAGLE 5 ISS, and distributes Shelf ID to the EAGLE 5 ISS. Each E5-TDM card contains one fixed SATA drive that is used to store primary and backup system databases, measurements, and Generic Program Loads (GPLs). E5-TDM cards are located in slots 1114 and 1116 of the control shelf.

Maintenance Disk and Alarm (E5-MDAL) Card

The E5-MDAL card processes alarm requests and provides fan control. There is only one E5-MDAL card in a control card set. Critical, major, and minor system alarms are provided for up to 6 individual frames. In addition to the 3 system alarms, the E5-MDAL card provides the system audible alarm. The E5-MDAL card provides control of fans on a per-frame basis, and allows for each fan relay to be set individually. The E5-MDAL card does not contain a removable cartridge drive; drives for removable media are located on the E5-MCAP card. The E5-MDAL card is located in slots 1117 and 1118 of the control shelf.

Input/Output Devices

There are two types of Input/Output (I/O) devices: terminals and printers. All I/O devices are connected to the system through the control shelf backplane. Each I/O device is described in terms of its function and its connection to the system. Refer to the *Installation Manual - EAGLE 5 ISS* for backplane connection information.

Terminals and Printers

The EAGLE 5 ISS uses VT320 terminals for maintenance and database administration. The EAGLE 5 ISS also can be configured to communicate with the SEAS interface (OAP). The terminals enable you to enter information into or receive information from the system. The system is capable of communicating with terminals at data rates from 2400 to 19,200 baud, using the ASCII character set.

You must configure terminals to operate with the system. You also must set printers (and modems) for hardware flow control. To do this, enable Data Terminal Ready (DTR) through your terminal's configuration menu. A modem also must have DCD set on "high." If your terminal has the auto-wrap feature, ensure that it is disabled before using your terminal on the system.

For information on the setup values for printers and terminals on the system, see the **chg-trm** command.

Terminals provide the following capabilities:

- Command input and output
- Continuous alarm states
- Event/Error messages

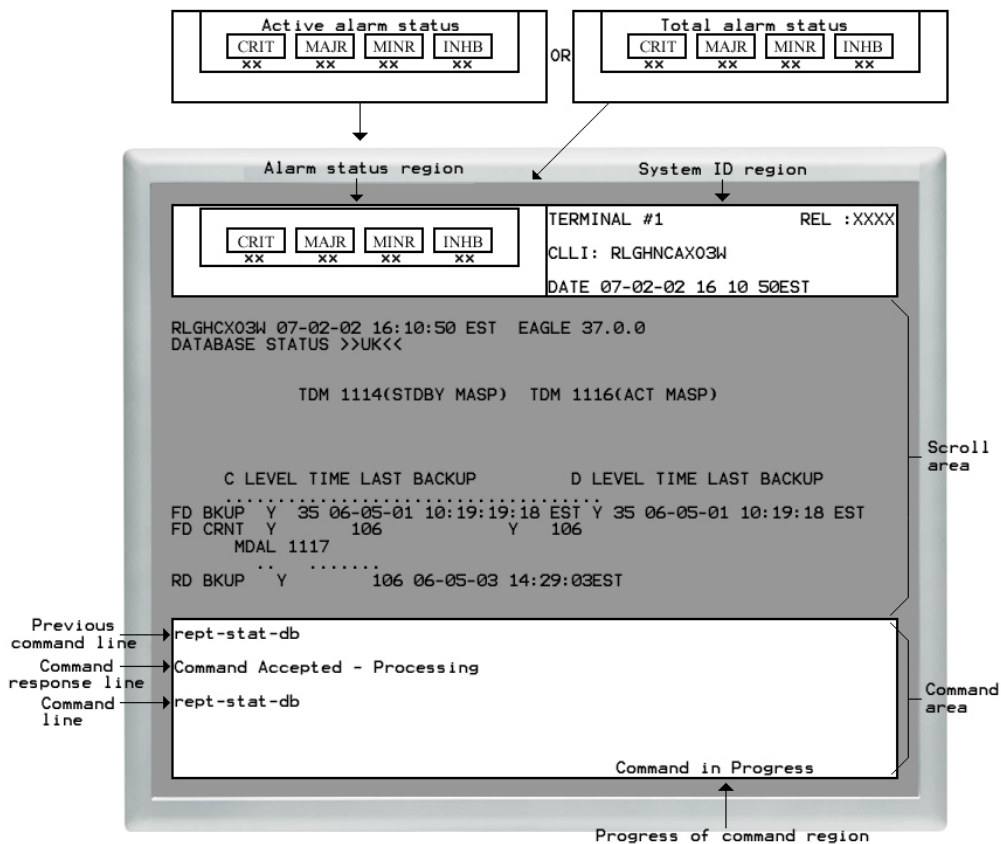

You enter commands at the terminal to perform system operations such as displaying the system status, administering system security, and maintaining the database.

An example of a terminal screen is shown in Figure 4-1. Note that the alarm status area is labeled either Total Alarm Status or Active Alarm Status depending on how the VT320 terminal is configured. See the **chg-stpopts** command description for configuration information.

Alarms are displayed in the alarm status area of the terminal screen. The alarm levels are as follows:

- Critical – Indicates a severe, service-affecting condition has occurred and that immediate corrective action is needed, regardless of the time of day or the day of the week.
- Major – Indicates a serious disruption of service or the failure of important circuits is taking place. These troubles require attention and response to restore or maintain system capability.
- Minor – Indicates a trouble, but one that does not have a serious affect on service.
- Inhibited – Indicates a device in the system with an inhibited alarm. A temporarily or permanently inhibited alarm does not generate unsolicited output or cause alarm indicators to be turned on. See the **inh-alm** command description for information on inhibited alarms.

Figure 4-1. System Terminal User Display

Event/Error messages also are issued to terminals to report system conditions or events. If the condition or event affects service, an alarm is issued along with an Event/Error message. Event/Error messages are displayed in the scroll area of the terminal screen.

Use the command line region of the terminal display () to enter commands. The command line region consists of two lines. Each of these lines can hold up to 80 characters. If you enter a command of more than 80 characters in length, the command appears on both lines. When you press the Enter

key, only the first 80 characters are displayed in the previous command line, followed by a message on the command response line showing the status of the command. The remaining characters have not been rejected; they are not displayed due to line length limitations. If you recall the command by pressing the Up arrow key or Down arrow key, all the characters in the command are displayed. For a description of the arrow key functions, see Table 4-2.

Terminal and Printer Connections

Terminals and printers are connected to the Terminal Disk Module (TDM), using the control shelf backplane. The TDM also provides Keyboard Send and Receive (KSR) function. A description of the TDM can be found in the *Installation Manual - EAGLE 5 ISS*.

KSR Function on VT320 Terminal Devices

The terminals can use the keyboard send and receive (KSR) mode of operation. KSR refers to a device or mode of operation that prints or displays all received data. The KSR mode of operation typically supports a teletype printer, but in the system, it also supports a video display unit and keyboard.

The KSR feature enables you to attach a dumb terminal device or teletype printer to the system's I/O ports or emulate KSR mode of operation on a VT320. KSR enhances the system's dial-up administration functions by allowing faster throughput, because the screen formatting characters associated with the VT320 mode of operation need not be transmitted.

KSR Configuration

This feature allows you to configure the operational characteristics of system's I/O serial ports to support KSR terminal devices. See Table 4-2 for a list of the keyboard functions used by the KSR feature. For information on configuring a serial I/O port for KSR operation, see the *Database Administration Manual - SS7*.

Changing the Mode Of Operation

Before you attempt to change the mode of operation of the terminal, you *must* follow the “Changing the Terminal Characteristics” procedure found in the *Database Administration Manual - SS7*. You must perform this procedure from another terminal.

You can change the mode of operation of the terminal by pressing the **F11** key. The **F11** key instructs the system to mimic a KSR. Command line editing operates exactly like the VT320.

The KSR emulation resembles a printer when in operation. The entire screen is used for output. Before you enter a command, press <Ctrl-A>. The command prompt (>) is displayed. Enter a carriage return to signify the end of command entry.

While in the KSR mode, all output to the video display unit is buffered. When any character is entered from the terminal, a one-minute timer is started and data reception from the system is stopped. The system responds to the command with the appropriate response, then resumes sending data where it left off.

If a carriage return is not received during command entry, a time-out occurs and the system resumes sending data to the terminal.

Requirements

The KSR function operates on any combination of terminal type assignments for the 16 available terminal ports.

Telnet Terminals

Telnet is a user command using the underlying TCP/IP protocol for accessing remote computers. Telnet provides a connection from a remote (client) to a host (server) computer; the client keyboard and monitor (or window) act as if physically attached to the host computer. Remote users log on as if they were local users with whatever privileges may have been granted to the specific applications and data on the remote computer. Remote users, after they log in, can use the same services as a local user.

The IP User Interface feature permits any standard telnet client to act as an EAGLE 5 ISS terminal. This IP-based access provides a standard interface through which EAGLE 5 ISS commands are entered from a telnet session to the EAGLE 5 ISS. The EAGLE 5 ISS then provides command responses back to the remote telnet terminal.

Up to 3 IPSM cards in the EAGLE 5 ISS, with IP connectivity, enable telnet clients to connect from anywhere on the customer's IP LAN. The EAGLE 5 ISS must be on the customer's LAN or WAN. Each IPSM card provides 8 telnet terminal ports (IDs 17-24 for the first card installed, 25-32 for the second card installed, and 33-40 for the third card installed), which are automatically made available when the card is installed and provisioned. See the **chg-trm** command description in this manual for more information about configuring telnet terminals. Refer to the "Adding an IPSM" procedure in the Database Administration Manual for information on configuring the IPSM.

From the telnet client, the remote user connect to any one of the equipped IPSM cards available by entering the command **telnet** *<IP address>*. For example,

```
telnet 192.168.1.100
```

The remote user then selects a terminal number from a list of available terminals. If an incorrect terminal number (one not listed in the prompt) is selected, the prompt appears again. (After three incorrect tries, the session is closed.) After the session is accepted, an EAGLE 5 ISS welcome message appears. At this point, broadcast messages (if provisioned) will begin to appear. See Figure 4-2.

Figure 4-2. Telnet Terminal Selection and Login

```

After a connection is made, the remote user can log in using a pre-provisioned user ID and password. (The user ID and password must be provisioned from an existing serial terminal.) The **login** command can be typed directly, without typing <Ctrl-A> first.

An EAGLE 5 ISS serial terminal emulating a Keyboard Send/Receive (KSR) device is normally in *display mode* (where outgoing messages are displayed). In order to enter a command, the user must interrupt the display by holding down the Ctrl key and typing an “a” (the ATTENTION or Ctrl-A key sequence). When the terminal controller receives an ATTENTION, it enters a *command entry mode*. The output text is temporarily halted, and the prompt symbol “>” appears.

The telnet terminal enters *command entry mode* when any key is pressed; <Ctrl-A> is not needed.

After the login is accepted and the user presses a key to receive the standard EAGLE 5 ISS command line prompt, all EAGLE 5 ISS commands assigned to that user ID are now accessible.

The display of broadcast messages can be interrupted with any keystroke, and will resume after a command is entered or a set timeout expires. When in command entry mode, the telnet server holds any outgoing messages in a buffer while a command is entered. A command entry is completed by pressing the Enter key.

The telnet server waits up to 60 seconds between keystrokes for the command text to be completed, before timing out and resuming the broadcast display. If the command entry times out, and output resumes, the incomplete command text might scroll off the screen. Even though the incomplete command was not executed, it is saved as an entry in the command buffer. This incomplete command will be displayed again when any key is pressed. The command string can be finished by continuing the typing where it was interrupted. Pressing the Enter key submits this command as usual.

Broadcast messages are held in a buffer from the time a key is pressed, until the command is complete (timed out, aborted, cancelled, or rejected). This is to allow command responses to be completely displayed. After the command completes, broadcast messages (if provisioned) will resume. The IPSM card buffer will hold up to 30 minutes of broadcast output before discarding the oldest messages.

When the user enters the **logout** command to end the telnet session, the user is logged off of the EAGLE 5 ISS, but the port remains assigned to the EAGLE 5 ISS telnet terminal. If the active port connection is lost for a reason such as hardware fault or system interruption, the telnet server resets affected ports, the session is closed, and the user ID is logged off.

The OA&M IP Security Enhancement feature provides secure connections to the EAGLE 5 ISS. Refer to Appendix B of the Database Administration Manual - System Management for information on using the PuTTY client to make a secure telnet connection.

SEAS Terminals

The SEAS Over IP feature introduces a TCP/IP-based interface for SEAS. The SEAS interface constitutes the path between the EAGLE 5 ISS and a Common Channel Signaling Message Router (CCS MR). The EAGLE 5 ISS uses the IP User Interface feature and E5-IPSM cards instead of EOAP to provide the paths for each SEAS TCP/IP link.

The E5-IPSM card allows one of the eight IP terminals to function as a SEAS terminal and provide connectivity between the CCS MR and the EAGLE 5 ISS. The E5-IPSM card also continues to provide the EAGLE 5 ISS with generic IP-based services, such as Telnet and FTP on the remaining seven IP terminals.

A maximum of 2 SEAS terminals can be configured in the EAGLE 5 ISS.

The **chg-trm:type=seas** command can be entered for terminals 17 - 40 when all conditions for a terminal to be set as a SEAS terminal are met.

The SEAS output group cannot be turned off for a SEAS terminal.

Element Management System Alarm Monitor Terminals

Element Management System Alarm Monitor (EMSALM) terminals display UAM alarm set and clear messages and the UIM 1083 “system alive” messages only. No other messages (including reports and other UIMs) are displayed. EMSALM terminals are designed to display alarm messages only. EMSALM terminals are not restricted in any other way. They can accept login, and commands; however these operations may interfere with alarm monitoring and should be performed on an alternate terminal.

Serial port terminal IDs 1-16 can be assigned as EMSALM terminals. These EMSALM terminals are a refinement of the KSR terminal, and contain all the KSR terminal communication parameters.

Telnet terminal IDs 17-40 can be assigned as EMSALM terminals when the IP User Interface feature is enabled and turned on and up to 3 IPSM cards are equipped in the system (see "Telnet Terminals" on page 4-6). These EMSALM terminals have all of the functions of a telnet type terminal.

When the **chg-trm** command is entered to change a terminal to the EMSALM type, all output group parameter values for that terminal default to YES, even if they were set to NO before the change. Even though an output group is set to YES for an EMSALM terminal, no reports or UIMS other than UIM 1083 will appear for that output group. Individual output group values can be changed to NO by entering another **chg-trm** command for an EMSALM terminal (do this only with caution; it can cause loss of UAM alarm messages at the EMSALM terminal).

When the **chg-trm** command is entered to change a terminal from type EMSALM to another type, the output group values remain unchanged. A **chg-trm** command can be entered to change output group settings.

About Commands

Commands allow you to interact with the system to perform specific functions. Commands are available to perform the following functions:

- Obtain system status and operational status
- Modify system configuration
- Obtain measurement reports

The following sections describe how to enter commands through a system terminal. Command correction, keywords, parameters, and syntax are described.

Entering Commands

All commands are entered at the command prompt (>), located in the bottom window of the terminal display. After entering a command, you must press the **Enter** key. When the command has executed (an output message appears in the display to indicate execution), you can enter another command. The **F9** function key allows you to interrupt a running command; however, you cannot enter another command until the running command completes its operation.

Commands are not case sensitive; therefore, either uppercase or lowercase characters can be used. Intermixing (using both upper and lower case) characters does not create an error message, but you must use the correct command syntax.

Action Commands

Throughout this manual, the term "action command" is used in the description of some dependencies, as in the sentence "No other action command can be in progress when this command is entered."

Action commands are used to effect changes to the state of entities within the system, such as cards and signaling links. For example, you use the **inh-card** command to change the state of the card to Out-of-Service - Maintenance Disabled (OOS-MT-DSBLD).

Table 4-1 lists the action commands and shows which type of system entity they are associated with.

Table 4-1. Action Commands and Their Associated System Entity

Action Commands	System Entity
act-slk, alw-slk, canc-slk, dact-slk, inh-slk, unhb-slk, blk-slk, ublk-slk, tst-slk	Link Commands
act-alm-trns, canc-alm-trns, rls-alm	Alarm Commands
alw-trm, inh-trm	Terminal Commands
alw-card, inh-card, rmv-card, rst-card	Card Commands

Command Keywords and Parameters

Commands consist of two parts: keywords and parameters. Keywords identify the principal action to be performed by the system, and consist of one to three words. Most commands also require parameters to further define the command operation.

Parameters are entered after the keyword. Each parameter must be separated from the keyword or the previous parameter with a colon. If a parameter has multiple values, the values entered are discrete and must be separated with a hyphen or comma. The parameters can be entered in any order.

Some command parameters have built-in default values that are used if a value is not specified. To accept a default value, press **Enter** after the desired keyword and parameters have been entered.

Use the following delimiters when entering commands:

- : —separates parameters
- or , —separates multiple values within a parameter block
- = —use as delimiter between the parameter and input value

The following is an example of a command entry:

```
> dact-slk:loc=1101:port=a
```

The keyword in the above example is **dact-slk** (Deactivate Signaling Link). The first parameter for this command is **loc=1101** (the actual card location in the system for the link being cancelled, based on equipment location). The second parameter is **port=a**. This parameter signifies which signaling link port on the card in the designated location has the link that is to be cancelled.

If an error is made while typing commands, use the **Delete** key to make corrections, one character at a time.

NOTE: If the same parameter is entered more than once in a command, the system accepts the last parameter value that was entered. Any values for the parameter that were entered earlier in the command are ignored.

Keyboard Functions

Some keyboard functions used with commands are described in the previous section. Keyboard functions available for use with commands are listed in Table 4-2. Arrow key functions are further described following the table.

Table 4-2. Keyboard Functions

VT320 Key Sequence	KSR Key Sequence	Description
↑	↑	The Up arrow key recalls the previous commands entered at the prompt, one command at a time. The Up arrow key scrolls backwards through up to 10 commands for a KSR, VT320, or SCCS terminal, and up to 20 commands for an IP UI telnet terminal. See page 4-13 for a description of the Up arrow key functions.
←	←	The Left arrow key backspaces the underline cursor without erasing.
↓	↓	The Down arrow key recalls the previous command entered at the prompt, one parameter at a time. If the Up arrow key is pressed and more than one command has been entered in the session, pressing the Down arrow key displays one previously entered command at a time. The Down arrow key scrolls forward through up to 10 commands for KSR, VT320, and SCCS terminals and up to 20 commands for IP UI telnet terminals. See page 4-14 for a description of the down arrow key functions.
→	→	The Right arrow key recalls the last command entered at the prompt, one character at a time.
F6	F6	The F6 Function key refreshes the terminal screen, including any characters already input on the command line and the command response line.
F7	F7	The F7 Function key clears the scroll buffer. This enables a user to stop useless information from passing to the scroll region of the system terminal.
F8	F8	The F8 function key enables you to stop and restart the scrolling of information on the terminal screen.

Table 4-2. Keyboard Functions

VT320 Key Sequence	KSR Key Sequence	Description
F9	F9	The F9 Function key allows you to interrupt a running command so that you can enter another command. Output and processing of the interrupted command continue. Pressing F9 is the same as issuing the canc-cmd command with no parameters. The commands that can be interrupted by pressing F9 are listed in the description of the canc-cmd command. If the terminal is running one of the listed commands and you press F9 , output and processing are cancelled. This function works only on the same terminal that is running the command you want to cancel. To cancel a command from another terminal, use the canc-cmd:trm= command (see the canc-cmd command description).
F10	F10	The F10 Function key displays help information for the last command that was entered, including parameters, parameter formats, and the command class.
F11	F11	The F11 Function key allows you to toggle the terminal's mode of operation from VT320 to KSR and from KSR to VT320. This function key has no effect on IP UI telnet terminals.
Not Available	Control-A	Control-A allows you to enter a command in the KSR mode.
Control-S	Control-S	Used with the <i>sw</i> or <i>both</i> flow control (see the chg-trm command description for more information), this key sequence sends the XOFF character to temporarily stop sending data.
Control-Q	Control-Q	Used with the <i>sw</i> or <i>both</i> flow control (see the chg-trm command description for more information), this key sequence sends the XON character to resume sending data.
Ins	Ins	When Insert is toggled on, typed characters are inserted into the command line, moving existing characters to the right. When toggled off, typed characters overwrite existing characters.

Table 4-2. Keyboard Functions

VT320 Key Sequence	KSR Key Sequence	Description
Del	Del	Deletes one character at a time from the right; the cursor stays in position.
Backspace	Backspace	Deletes a character and moves the cursor one space to the left.

Arrow Key Operation

The arrow keys are used to move the cursor to a different position in a command, and to display part or all of a command that was previously entered.

On KSR, VT320, and SCCS terminals, you can scroll through the last 10 commands that were entered at the terminal during the session. On IP UI telnet terminals, you can scroll through the last 20 commands that were entered at the terminal during the session. Part or all of one command at a time is displayed. When you have scrolled through the complete list of up to 10 or 20 commands, the scrolling wraps back to the beginning of the list.

The list of previously entered commands is cleared when a terminal is inhibited and allowed (**inh-trm:trm=xx** and **alw-trm:trm=xx**) and when a file transfer is initialized with the **act-file-trns** command.

There are two modes of command recall for Up and Down arrow keys:

- Edit Mode
Edit Mode includes any key operation that changes the command at the prompt, such as the Delete key, the Back Space key, or an alphanumeric key. Pressing one of these keys to enter or change a command puts the terminal into Edit Mode. Pressing the Enter key (or carriage return) takes the terminal out of Edit Mode.
- Non-edit Mode
Pressing the Enter key (or carriage return) puts the terminal into Non-edit Mode. A terminal remains in Non-edit Mode when you press an arrow key, a Function key, or the Insert key, which do not change the command at the prompt. When you press a key that changes the command, the terminal goes into Edit Mode until you press the Enter key again.

Up Arrow Key

The Up arrow key is used to recall up to the last 10 commands (KSR, VT320, and SCCS terminals) or the last 20 commands (IP UI telnet terminals) entered at the prompt during the session.

In Edit Mode

- You enter 3 characters of a command at the prompt and press the Up arrow key. If the previous command was 6 characters long, then the last 3 characters of the previous command are recalled and displayed after the 3 characters that you entered at the prompt.
- You enter 10 characters of a command at the prompt and press the Up arrow key. If the previous command was 6 characters long, none of the previous command is displayed. The command that you entered remains as you entered it at the prompt.

- Entering part or all of a command at the prompt puts the terminal into Edit Mode. In Edit Mode, the last (or previous) command is recalled only if the command length of the last command is greater than the command at the prompt. For example,;

In Non-edit Mode

- When you have pressed the Enter key and there is no command at the prompt, or you have pressed the Insert key or a Function key, the terminal is in Non-edit Mode.
- When you press the Up arrow key in Non-edit Mode, and you have entered at least one previous command, the last command that you entered is displayed at the prompt. Pressing the Up arrow key again clears the command at the prompt (if any) and displays the next previous command that you entered (if any). By continuing to press the Up arrow key, you can scroll backwards through the last 10 commands (KSR, VT320, and SCCCS terminals) or the last 20 commands (IP UI telnet terminals) that you entered at the terminal. The display wraps back to the most recent of the entered commands when all of the available commands have been recalled. The terminal remains in Non-edit Mode until you press a key that changes the displayed command.

Down Arrow Key

In Edit Mode, the Down arrow key recalls the last command that was entered at the terminal, one parameter at a time. The recalled parameter is displayed at the end of the entry that currently appears at the prompt.

In Non-edit Mode:

- If the Up arrow has not been pressed just before pressing the Down arrow key, the Down arrow key recalls the last command that was entered at the terminal, one parameter at a time.
- If the Up arrow key is the last key that was pressed before the Down arrow key is pressed, the Down arrow key scrolls forward through the last 10 commands (KSR, VT320, and SCCS terminals) or last 20 commands (IP UI telnet terminals), displaying one complete command each time the key is pressed. The scrolling wraps to the beginning of the list when all of the available commands have been displayed.

Right Arrow Key

Each time the Right arrow key is pressed, one character of the last command is recalled and the cursor moves one position to the right. When the last command is completely displayed, pressing the Right arrow key does not cause any cursor movement or character display.

Left Arrow Key

The Left arrow key moves the underline cursor one position to the left without erasing the character. The underline cursor can be moved until it reaches the first character at the left of the command. If

the Left arrow key is pressed again after the cursor reaches the first character of the command, the bell sounds.

Command Output and Messages

Reports and outputs generated through retrieve or report status commands are followed by a semi-colon (;) to signify the end of the output (this is in compliance with TL1 standards).

The following types of output messages are used on the system:

- **Command Accepted—Processing:** The command has been accepted by the application's command handler as syntactically correct. This message is displayed in the command area of the terminal display.
- **Command Completed—**The command has been entered, and the system has completed processing. This message is displayed in the scroll area of the terminal display.
- **Command Executed—**The command has been entered, and the system has completed processing. This message is displayed in the command area of the terminal display.
- **Command Failed—**The command was executed but failed due to an external reason, such as the link is not equipped or a disk drive is unable to communicate. The reason for the failure is included in this message.
- **Command Rejected—**The command syntax could be incorrect, or a parameter value is incorrect (semantic error). This message is displayed in the command area of the terminal display. The reason for rejecting the command (command syntax or incorrect parameter value) is included in this message.
- **Command Aborted—**The command syntax and the parameter values are ok, but for some reason the command was aborted (for example, a disk drive is inaccessible). This message is displayed in the scroll area of the terminal display.
- **Command Response Messages—**A command is entered at the terminal, and the response to that command is echoed on that same terminal. These messages are displayed in the scroll area of the terminal display.
- **Unsolicited Messages—**An example of unsolicited messages are the messages delivered in response to alarm conditions. These messages are displayed in the scroll area of the terminal display.

The unsolicited messages can be directed to a specific terminal or printer by using the **chg-trm** command to assign one or more of the following groups of unsolicited output messages to the specified terminal or printer.

Application Server	Application Subsystem
Card	Clock
Debug	Global Title Translation
Gateway Screening	Measurements Maintenance
Monitor	MPS
SEAS Maintenance	SLAN Maintenance
System Maintenance	Security Administration

Traffic Measurements	Database Administration
Link Maintenance	Program Update
LNP Database Administration	LNP Subscription

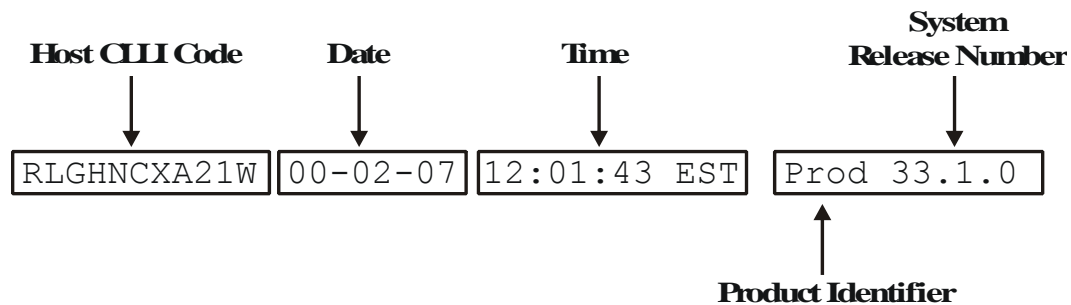

To configure a terminal to receive unsolicited LNP database administration and LNP subscription messages, the LNP feature must be turned on (see the **enable-ctrl-feat** command).

Command Output Banners

When a command is executed in the system, one or more banner lines appear in the output that is displayed for the command.

Figure 4-3. shows the general format of an output banner.

Figure 4-3. Output Banner Format

The following fields appear in each output banner:

- **Host CLI code**—a maximum of one alphabetic character and ten alphanumeric characters. The CLI code uniquely identifies the system in terms of its physical location. The CLI code must be unique among all elements in the system. The CLI code contains the following information:
 - City—4 characters
 - State— 2 characters
 - Building— 2 characters
 - Equipment type —3 characters
- Date—year-month-day
- Time—hour: minute: second time zone
- System Release Number— contains a product identifier and the version ID number. The product identifier, which is shown as ‘Prod’ in Figure 4-3 and the output examples in this manual, can appear as “EAGLE” or “EAGLE5” depending on which product key is turned on in the system (see the **rtrv-ctrl-feat** output example). If one or more “EAGLE 5” features are enabled in the system, the EAGLE5 product key must also be turned on and EAGLE5 will appear in the banner. If there are no “EAGLE 5” features enabled in the system, the EAGLE product key will be turned on and EAGLE will appear in the banner. (If both the EAGLE5 and EAGLE product keys are enabled, the EAGLE5 product key should be turned on and appear in the banner).

The version ID number identifies the GPL set that is specific to the software release that is expected to be installed on the system as approved loads. The format of the version ID number is *maj.min.maint*, defined as follows:

- *maj*—the major release ID
- *min*—the minor release ID
- *maint*—the maintenance release ID

System Security

User IDs and passwords protect the system from unauthorized entry into the system and enhance system security. To enter the system through a terminal, a user must enter a valid user ID and password at the system prompt, and the user ID and password must be authorized for use together. A user ID identifies a user to the system.

To maintain the security of the system, passwords should be changed periodically and user IDs should be deleted whenever there is a personnel change.

When prompted to enter a new password, a different password should be provided. This is the responsibility of the user, and is not enforced by the EAGLE 5 ISS.

Rules for User ID and Password Administration

The rules for administering User IDs and passwords are:

- The maximum number of user ID-password combinations is 100.
- The maximum length of the user ID is 16 characters.
- The maximum length of the password is 12 characters; the minimum length is site provisionable using the **chg-secu-dflt** command, and it can be from 1 – 12 characters long.
- User IDs and passwords may contain any printable characters except the characters used as command delimiters: colon (:), comma (,), hyphen (-), or equal sign (=).
- Each user ID must begin with an alpha character.
- A password must contain:
 - At least as many characters as specified on the **minlen** parameter of the **chg-secu-dflt** command
 - At least as many alphabetic characters as specified on the **alpha** parameter of the **chg-secu-dflt** command
 - At least as many numeric characters as specified on the **num** parameter of the **chg-secu-dflt** command
 - At least as many punctuation characters as specified on the **punc** parameter of the **chg-secu-dflt** command
- A password must not contain the associated user ID.

Command Classes

Each user ID and password combination is assigned to one or more command classes to control the set of commands that a user may enter.

There are 8 unique non-configurable command classes: Basic, Database Administration, Debug, Link Maintenance, Program Update, Security Administration, System Maintenance, and LNP Basic. (The Basic command class is assigned to all users as a default.)

There are 32 available configurable command classes. See the **chg-cmd** command description and the **chg-cmdclass** command description for information about naming and assigning commands to configurable command classes.

See the **chg-user** command description or the **ent-user** command description for more information on configuring user IDs and passwords and assigning command classes.

Login Security Checks

To aid in system security, the system maintains a record of when a password was last changed and requires a user to change the password when it is older than the site-specified maximum password age. The system also keeps track of the elapsed time between successful logins. If the time between successful logins exceeds the site-specified maximum, a user is not allowed access to the system. The site systems administrator also has the ability to revoke a user ID.

When a user first logs into the system, the default unauthorized user warning is displayed as follows

```
NOTICE: This is a private computer system.
```

```
Unauthorized access or use may lead to prosecution.
```

Additional security is available for the system in that multiple logins using the same user ID are prohibited.

Intrusion Alert

To alert the system administrator to a possible attempt by an unauthorized person trying to log into the system, the system issues a scroll area message. When 5 or more consecutive attempts to log into the system have failed, the following scroll area message is sent to all terminal ports that can receive unsolicited Security Administration messages:

```
Info: xxxxxxxxxx successive LOGIN failures on port pp
```

Where:

xxxxxxx is the number of consecutive login failures on the port (1 – 4,294,967,295)

pp is the terminal port (1 – 40) on which the login attempts were made

When the attempt to log into the system is successful after a series of failed consecutive login attempts, or if the active MASP reboots, the count of failed consecutive login attempts for that port is reset to 0.

Attempts to log into the system that are not completed normally, are not considered login attempts and are not included in the count of failed consecutive login attempts. For example, while prompting

for a password you might use the **F9** key to abort the command, or errors might occur when the system is looking up a user ID or password.

Login Procedure

The commands described in this manual are entered at a terminal connected to the system. Before you can enter most of the commands, you must enter the **login** command to log into the system and open a user session. You must enter the login command with a valid user ID and password combination. When the system accepts your user ID and password as valid, you can enter commands at the terminal in the user session.

The first procedure in this section explains how to log into the system using the **login** command.

The procedures that follow the login procedure explain how to handle common situations that can arise when you log into the system.

- You must change the password the first time that you log in with a new user ID and password.
- The user ID and password that you enter are not accepted as valid.
- Your password has expired and must be changed.
- Someone else has already logged on with your user ID and password; the system does not allow the same ID and password to be used on two terminals at the same time.

NOTE: You can enter the act-user command instead of the login command.

Procedure - Log into the System for a User Session

1 At the system prompt (>), enter the **login** command with your user ID.

2 Press the **Enter** key.
The following message appears:

```
Enter Password:
```

3 At the system prompt, type your password.
For security reasons, the password is not displayed on the terminal screen.

4 Press the **Enter** key.
Follow the remaining steps to complete this procedure or to go to another procedure, depending on the system response to validation of your user ID and password.

5 If your user ID and password combination are accepted and the following messages appear in the terminal input/command response region, the terminal is available for a user session.

```
Command Accepted-Processing  
Command Executed
```

This procedure is complete.

6 If your user ID and password combination are not accepted and the following message appears, go to ""Procedure - Your User ID and Password were not Accepted" on page 4-18.

```
E2757 Cmd Rej: Invalid UserID/Password Combination
```

- 7 If you entered a new user ID and password combination for the first time, the following message appears, go to page 4-20 .

```
Enter new password (password must be changed) :
```

- 8 If you entered your user ID and password combination and your password has expired, the following message appears, go to page 4-21 .

```
Enter new password (password has expired and must be changed) :
```

- 9 If you entered your user ID and password combination and they are already being used at another terminal, the following message appears. Go to page 4-22 .

```
E2750 Cmd Rej: UserID already logged on (or is logging on) another port
```

Procedure - Your User ID and Password were not Accepted

- 1 This procedure outlines the steps to follow when you attempt to log into the system and your user ID and password combination are not accepted.
When you entered the **login** command with your user ID and entered your password at the system prompt, the following message appeared:

```
E2757 Cmd Rej: Invalid UserID/Password Combination
```

When this message is displayed, the terminal also presents a message describing the login attempt and the time and date the attempt occurred.

- 2 Verify that you have the correct user ID and password.
Return to the login procedure, and log in again with the correct user ID and password.
If the problem occurs again, contact your System Administrator.
-

Procedure - You Must Change Your Password

- 1 This situation can occur when you first log in after the system administrator uses the **ent-user** command to enter a new user ID and password combination, or when you first log in after the **chg-user:pid=yes** command has been entered.
When you entered the **login** command with your user ID and entered your password at the system prompt, the following message appeared:

```
Enter new password (password must be changed) :
```

Type a new password, following your site guidelines.

For security reasons, the password is not displayed on the terminal screen.

- 2 Press the **Enter** key.

The system checks the password to ensure that it meets your site's password complexity requirements.

- 3 If your password does not meet your site's password complexity requirements, the system displays a message based on the password violation (see page 4-22 for a list of possible messages).

The login process ends.

Decide on a new password, and start the login procedure again.

- 4 If your password meets the complexity requirements, the following message appears:

Verify Password:

Type the exact password again that you entered in Step 1

For security reasons, the password is not displayed on the terminal screen.

- 5 Press the **Enter** key.
-

- 6 If the user ID and password combination are accepted and the following messages appear in the terminal input/command response region, the terminal is available for a user session

Command Accepted-Processing
Command Executed

- 7 Record your new password in a secure location.
-

Procedure - Your Password has Expired

- 1 When you entered the **login** command with your user ID and entered your password at the system prompt, the following message appeared:

Enter new password (password has expired and must be changed) :

Type a new password, following your site guidelines.

For security reasons, the password is not displayed on the terminal screen.

- 2 Press the **Enter** key.
The system checks the password to ensure that it adheres to your site's password complexity requirements.
-

- 3 If your password does not meet your site's password complexity requirements, the system displays a message based on the password violation (see page 4-22 for a list of possible messages).

The login process ends.

Decide on a new password, and start the login procedure again.

- 4 If your password meets the complexity requirements, the following message appears:

Verify Password:

Type the exact password again that you entered in Step 1

For security reasons, the password is not displayed on the terminal screen.

5 Press the **Enter** key.

6 If the user ID and password combination are accepted and the following messages appear in the terminal input/command response region, the terminal is available for a user session

```
Command Accepted-Processing
Command Executed
```

7 Record your new password in a secure location.

Procedure - Your User ID is Already Being Used

1 When you entered the **login** command with your user ID and entered your password at the system prompt, the following message appeared:

```
E2750 Cmd Rej: UserID already logged on (or is logging on) another port
```

The following information is displayed in the scroll area:

```
Info: UID is currently logged on (or is logging on) to port yy.
```

where yy is in the range of 1 - 40.

2 Find the terminal at port yy, and log off your user ID at that workstation.
See page 4-23 .

3 Return to your terminal and log into the system again.

Login Error Messages

- E2262 Cmd Rej: Password too long, 12 maximum
- E2263 Cmd Rej: Password does not contain enough characters
- E2264 Cmd Rej: Password verification failed
- E2750 Cmd Rej: UserID already logged on (or is logging on) another port
- E2751 Cmd Rej: UserID has been revoked
- E2752 Cmd Rej: UserID has become obsolete and cannot be used
- E2753 Cmd Rej: Password does not contain enough alphabetic characters
- E2754 Cmd Rej: Password does not contain enough numeric characters
- E2755 Cmd Rej: Password does not contain enough punctuation characters
- E2756 Cmd Rej: Failed reading the password table

- E2757 Cmd Rej: Invalid userID/password combination
- E2758 Cmd Rej: ALPHA+NUM+PUNC must not be greater than 12
- E2759 Cmd Rej: Revocation of security admin userID not allowed
- E2760 Cmd Rej: Failed reading the security defaults table
- E2761 Cmd Rej: Password cannot contain userID

See the **chg-secu-dflt** command description for information on different options the system administrator has for configuring the system for password requirements.

The following is an example of the information that might be displayed in the scroll area, depending on your site's configuration:

New password must contain

- from 8 to 12 characters
- at least 1 alphabetic character(s) (a – z)
- at least 1 numeric character(s) (0 – 9)
- at least 1 punctuation character(s) (for example, \$%#@#)

Logout Procedure

When a terminal session is completed, you perform the following logout procedure to log out of the system. The terminal returns to an input idle state.

NOTE: You can use the `dact-user` command instead of the `logout` command.

Procedure - Log Out Of the System

- 1 At the system prompt (>), enter the **logout** command.
- 2 Press the **Enter** key.
The following messages appear on the terminal screen to confirm command completion:

```
Command Accepted-Processing  
Command Executed
```

Commands

Introduction

This chapter contains commands that are not pass-through or debug commands. The commands are listed in alphabetical order starting on page 5-1 .

For each command listed in this chapter, the following information is given:

- A description of the command
- The command syntax
- A list of related commands
- The command class to which the command belongs
- A description of the command parameters
- An example of the command usage
- Rules, dependencies, and notes relevant to the command
- Sample command output

act-alm-trns

Activate Alarm Transfer

Use this command to transfer all alarm indications from the local office to the remote maintenance center.

Keyword: `act-alm-trns`

Related Commands: `dact-alm-trns`, `rept-stat-clk`, `rept-stat-trbl`, `rtrv-obit`, `rtrv-trbl`

Command Class: System Maintenance

Parameters

This command has no parameters.

Example

```
act-alm-trns
```

Dependencies

No other action command can be in progress when this command is entered.

Notes

After this command is entered, use the **rept-stat-alm** command to verify the **act-alm-trns** action.

New alarms cause the local maintenance center audible alarms to sound for a short period.

Output

```
act-alm-trns
  rlghncxa03w 04-01-09:50:17 EST  EAGLE 31.3.0
  Alarms transferred to Remote Maintenance Center
  Command Completed.
;
```

act-cdl**Activate Command Driven Loopback**

Use this command to initiate a command driven loopback for testing a signaling link.

Command Driven Loopback is the ability to locally drive a signaling link into a manual line loopback. The data received on the signaling link is echoed (transmitted) back. This is effectively the reverse of the **tst-slk:loopback=lxvr**, which loops the transmitted data back to the receiver.

Keyword: act-cdl

Related Commands: act-lbp, dact-cdl, dact-lbp, rept-stat-cdl, tst-slk

Command Class: Link Maintenance

Parameters

:link= (mandatory)

SS7 signaling links. The SS7 signaling link to be tested.

Synonym: port

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid link parameter range values for each type of card that can have assigned signaling links.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:loopback= (optional)

Loopback test type.

Range: line, payload

Default: line

Example

```
act-cdl:loc=1205:link=b
```

Dependencies

The card location specified in the **loc** parameter must be equipped.

The signaling link specified in the **link** parameter must be equipped.

LFS processing must be stopped or must be allowed to complete on the specified signalling link before this command can be entered.

The **loopback=payload** parameter is valid only for LIM-ATM and E1-ATM cards.

Command Driven Loopback testing is not available during upgrade.

A Command Driven Loopback test cannot be in progress on the specified link when this command is entered.

A **tst-slk** command cannot be in progress on the specified link when this command is entered. The **tst-slk** processing must be stopped or must be allowed to complete before this command can be entered

The card location specified in the **loc** parameter must be in the In-Service-Normal (IS-NR) state.

The card location specified in the **loc** parameter must support Command Driven Loopback testing.

The signaling link specified in the **link** parameter must not be active.

The card location specified in the **loc** parameter cannot be reserved by the system.

Notes

None

Output

```
act-cdl:loc=1205:link=b
tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
Command Accepted: Command Driven Loopback message is sent.
;

tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
Command Completed.
;
```

act-dlk

Activate Data Link

Use this command to activate a TCP/IP data link and put the link into service. The state of the link is changed from out of service maintenance disabled (OOS-MT-DSBLD) to in service normal (IS-NR).

Keyword: act-dlk

Related Commands: **canc-dlk**, **dlt-dlk**, **ent-dlk**, **rept-stat-dlk**, **rtrv-dlk**, **tst-dlk**

Command Class: Link Maintenance

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

```
act-dlk:loc=1308
```

Dependencies

No other action command can be in progress when this command is entered.

The shelf and card must be equipped.

The card location must contain a card that is running the STPLAN application.

The card location, frame, shelf, or slot must be within the allowed range.
 A card location that is valid and defined in the database must be specified.
 The card in the location specified by the **loc** parameter must be in service.
 The **ipaddr** parameter must specify a valid IP address.

Notes

None

Output

```
act-dlk:loc=1308
rlghncxa03w 04-01-17:00:36 EST EAGLE 31.3.0
Activate Link message sent to card.
Command Completed.
;
```

act-echo

Activate Echo

Use this command to force responses from the scroll area of a terminal to be printed to a specified terminal or printer. The command supports one terminal echoing to many terminals or many terminals echoing to one terminal.

CAUTION

CAUTION: Exercise restraint in using this command, because excessive echoing can cause a loss of output at the receiving terminal.

Keyword: act-echo

Related Commands: chg-trm, dact-echo, rept-stat-trm, rmv-trm, rst-trm, rtrv-trm

Command Class: Basic

Parameters

:trm= (mandatory)
 Serial port number.
Range: 1-16

Example

```
act-echo:trm=3
```

Dependencies

If a terminal is already echoing to a specified terminal, the **act-echo** command cannot be entered to echo the terminal's output to that same terminal.

Echo is not allowed to the terminal from which the command is issued.

Echo is not allowed to or from IP User Interface telnet ports (terminals 17-40).

Terminal output cannot be echoed to a terminal that is inhibited.

The **trm** parameter must be specified.

Notes

This command can be used to echo only command output responses to a terminal. For alarm and network messages to be sent to a terminal, the **chg-trm** command must be used.

To echo output to a destination port, a user must be logged in at the destination port. The following warning message appears in the scroll area of the issuing terminal if echo is attempted to a terminal that has no user logged in:

No user logged in at Terminal X. No echo will occur until a user logs in, where X is the **trm** parameter value specified in the **act-echo** command.

Output

act-echo:trm=2

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
act-echo:trm=2
Command entered at terminal #1.
```

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Scroll Area Output is echoed to terminal 2.
```

Caution: Loss of output may occur if too many terminals are echoed.

;

act-echo:trm=3

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
act-echo:trm=3
Command entered at terminal #1.
```

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Scroll Area Output is echoed to terminal 2.
Scroll Area Output is echoed to terminal 3.
```

Caution: Loss of output may occur if too many terminals are echoed.

;

act-file-trns

Activate File Transfer

Use this command to start a file transfer between the system and a remote computer.

Keyword: act-file-trns

Related Commands: copy-fts, disp-fts-dir, dlt-fts

Command Class: System Maintenance

Parameters

:loc= (optional)

The location of the fixed disk to or from which the file is to be uploaded or downloaded.

Range: 1114, 1116

Active and standby TDM locations

Default: The active TDM location

:retries= (optional)

The number of times the system retries a packet before giving up.

Range: 1-20

Default: 10

:timeout= (optional)

The number of seconds the system waits for a packet before sending a negative acknowledgment or retransmitting the previous packet. This parameter also specifies the number of seconds to wait for a transfer initiation message from the remote computer.

Range: 1-120

Default: 30

Example

```
act-file-trns:loc=1116
```

Dependencies

The **loc** parameter must specify a TDM card.

Only one file transfer can be active at a time.

This command cannot be entered on a telnet terminal (IDs 17-40).

Notes

Output messages indicating transfer initiated and transfer terminated (whether successful or not) are sent to the output devices in the Security Administration output group.

LNP Measurements

When used to output LNP measurements, the **rept-meas** command sends data to the FTA. Extracting LNP measurements from the FTA requires:

- A computer with a VT320 or KSR connection to the system
- A communication program that both emulates VT terminals and supports Kermit file transfer
- A spreadsheet program that can import Comma Separated Value (CSV) text files

A PC running ProComm© for Windows and Microsoft Excel© can be used.

Use the following procedure to collect LNP measurements.

Procedure - Extracting LNP Measurements from the FTA

- 1 Enter the following command to display the contents of the FTA:
disp-fta-dir:loc=xxxx
Where **xxxx** = the active TDM (**1114** or **1116**)

- 2 Enter the following command to delete any existing files from the FTA:
dlt-fta:loc=xxxx:all=yes
Where **xxxx** = the active TDM (**1114** or **1116**)

- 3 Enter the command to send LNP daily measurements to the FTA. For example:
rept-meas:enttype=lnp:type=mtcd

- 4 Enter the following command to activate the file transfer:
act-file-trns:loc=xxxx
Where **xxxx** = the active TDM (**1114** or **1116**)

- 5 Enter the following command to display a list of the files transferred to the FTA in step 4:
disp-fta-dir:loc=xxxx
Where **xxxx** = the active TDM (**1114** or **1116**)

- 6 Use the **get** command from within the communications program configured to run Kermit in ASCII mode to transfer the desired files (with the .csv suffixes) to the PC. For example:
> **get mday_lnp.csv**
> **get mday_ssp.csv**
> **get mday_lrn.csv**

```
> get mday_npa.csv  
> finish
```

7 Run a spreadsheet program and open each of the collected files to view the LNP measurement data.

8 After all files are successfully transferred and confirmed, enter the following command to remove the files from the FTA:

```
dlt-fta:loc=xxxx:all=yes
```

Where **xxxx** = the active TDM (**1114** or **1116**)

Output

Normal session output to non-Security Administration user's terminal.

```
act-file-trns:loc=1114:timeout=20:retries=2
rlghncxa03w 04-01-05 14:37:05 EST EAGLE 31.3.0
act-file-trns:loc=1114:timeout=20:retries=2
Command entered at terminal #1.
;
rlghncxa03w 04-01-05 14:37:05 EST EAGLE 31.3.0
Awaiting File Transfer with remote.
Please initiate binary Kermit session on local computer
;
rlghncxa03w 04-01-05 14:38:33 EST EAGLE 31.3.0
File Transfer : 0 file(s) DOWNLOADED from location 1114 successfully
File Transfer : 1 file(s) UPLOADED to location 1114 successfully
File Transfer : Kermit Session terminated NORMALLY
```

Normal session output to Security Administration group terminals.

```
act-file-trns:loc=1114:timeout=20:retries=2
rlghncxa03w 04-01-05 14:40:42 EST EAGLE 31.3.0
File Transfer : INITIATED on terminal #1
;
rlghncxa03w 04-01-05 14:41:07 EST EAGLE 31.3.0
File Transfer: 511_byte.bin UPLOADED to location 1114 successfully.
;
rlghncxa03w 04-01-05 14:41:44 EST EAGLE 31.3.0
File Transfer : terminated NORMALLY on terminal #1
```

Normal session output to Security Administration user's terminal.

```
act-file-trns:loc=1114:timeout=20:retries=2
rlghncxa03w 04-01-05 14:42:51 EST EAGLE 31.3.0
act-file-trns:loc=1114:timeout=20:retries=2
Command entered at terminal #1.
;
rlghncxa03w 04-01-05 14:43:29 EST EAGLE 31.3.0
File Transfer : INITIATED on terminal #1
;
rlghncxa03w 04-01-05 14:43:53 EST EAGLE 31.3.0
Awaiting File Transfer with remote.
Please initiate binary Kermit session on local computer

rlghncxa03w 04-01-05 14:44:19 EST EAGLE 31.3.0
File Transfer: 511_byte.bin UPLOADED to location 1114 successfully.
;
rlghncxa03w 04-01-05 14:44:52 EST EAGLE 31.3.0
File Transfer : 0 file(s) DOWNLOADED from location 1114 successfully
File Transfer : 1 file(s) UPLOADED to location 1114 successfully
File Transfer : Kermit Session terminated NORMALLY
;
rlghncxa03w 04-01-05 14:45:31 EST EAGLE 31.3.0
File Transfer : terminated NORMALLY on terminal #1
;
```

act-flash**Activate Flash**

Use this command to activate the trial FLASH GPL that is currently running on one target card or on a range of cards.

Keyword: act-flash

Related Commands: clr-imt-stats, flash-card, init-flash, init-imt-gpl, rept-imt-info, rept-imt-lvl1, rept-imt-lvl2, tst-imt

Command Class: System Maintenance

Parameters

NOTE: As of Release 43.0, the BLBEPM, BLBIOS, BLBSMG, BLCPLD, BLDIAG6, BLROM1, BLVXW6, IMTPCI, and PLDPMC1 GPLs are replaced with the BLIXP GPL. The replaced GPLs are used only during upgrade to Release 43 and hardware replacement.

:eloc= (optional)

End location. This parameter specifies the location of the last card of a range of cards to be activated.

Range: 1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118

:gpl= (optional)

Generic program load. This parameter specifies the flash GPL type that is running on the cards in the specified range of cards.

This parameter must be specified for cards that have more than one flash image (GPL).

Range: *xyyyyyyy*

1 alphabetic character followed by up to 7 alphanumeric characters.

Valid GPLs are: **blbios**, **blbepm**, **blbsmg**, **blcpld**, **bldiag6**, **blixp**, **blmcap**, **blrom1**, **blvxw6**, **bpdcn**, **bpdcn2**, **bphcap**, **bphcapt**, **bphmux**, **bpmp1**, **bpmp1t**, **hipr**, **hipr2**, **imtpci**, and **pldpmc1**.

:loc= (optional)

The location of a single target card.

Range: 1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118

:sloc= (optional)

Start location. This parameter specifies the location of the first card of a range of cards to be activated.

Range: 1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118

Example

```
act-flash:loc=1105
```

```
act-flash:sloc=1101:eloc=1112:gpl=bpmp1
```

Dependencies

The card, or cards, in the specified location or range of locations for this command must be actively running a flash GPL in *trial* mode.

The allowed cards are HCAP, HCAP-T, DCM, E1/T1 MIM, E5-ENET, E5-ENET-B, HC-MIM, E5-E1T1, E5-TSM, E5-IPSM, E5-MCAP, GPSM-II, MPL, or Service Module. Card locations *xy09* and *xy10* (*x* is the frame, *y* is the shelf) can be specified only for HMUX, HIPR, or HIPR2 cards.

Each specified card does not have to be defined in the database, but it does have to be aligned on the IMT bus.

If the target card is an HMUX, HIPR, or HIPR2 card, then both card locations specified in the **sloc** and **eloc** parameters must contain HMUX, HIPR, or HIPR2 cards on the same IMT bus. For these cards, the bus is implicit based on the specified location. Location *xy09* specifies an HMUX, HIPR, or HIPR2 A Bus, and location *xy10* specifies an HMUX, HIPR, or HIPR2 B Bus (*x* is the frame and *y* is the shelf). For example, **sloc=1109:eloc=6109** specifies all HMUX, HIPR, or HIPR2 cards on the A Bus only; **sloc=1110:eloc=6110** specifies all HMUX, HIPR, or HIPR2 cards on the B Bus

only. HMUX, HIPR, or HIPR2 cards from both the A bus and B bus cannot be flash downloaded simultaneously.

The card must be running an inactive flash GPL when this command is executed.

The provisioning subsystem mode (simple, duplex) must be established prior to executing the command.

The **loc** parameter cannot be specified with the **eloc** and **sloc** parameters.

Either the **loc** parameter or the **eloc** and **sloc** parameters must be specified.

The **eloc** and **sloc** parameters must be specified together in the command; one parameter cannot be specified without the other parameter.

The **sloc** parameter value cannot be greater than the **eloc** parameter value.

The cards in the specified **sloc** and **eloc** card locations must be present and able to communicate over the IMT. The cards do not have to be provisioned in the database.

The **gpl** parameter must be specified if the **eloc** and **sloc** parameters are specified.

The **gpl** parameter must be specified for cards that have more than one flash image (GPL).

Cards in the locations specified by the **sloc** and **eloc** parameters must be running the specified GPL. Other cards in the range of locations can be running other GPLs but will not be activated. Only cards that are within the range and running the specified GPL will be activated.

A card that is the active MASP cannot be specified for the **loc**, **sloc**, or **eloc** parameter.

No other action command can be in progress when this command is entered.

A card location that is valid and defined in the database must be specified.

The cards specified in the **sloc** and **eloc** location parameters must be running the specified general program load (gpl).

This command cannot be entered during an Extended Bit Error Rate Test (BERT).

Notes

None

Output

```

act-flash:loc=1105

act-ftp-trns**Activate FTP Transfer**

Use this command to activate an FTP transfer to send database tables from the system to the customer's FTP server.

NOTE: This command is not for customer use. It is for Tekelec use only.

Keyword: act-ftp-trns

Related Commands:

Command Class: Database Administration

Parameters

:action= (mandatory)

The operation that the command is to perform.

Range: put

:filetype= (mandatory)

The system table type to be transferred.

Range: mtp, gtt, gws, vflex, ip, all, exts

mtp—Transfer all Message Transfer Part tables

gtt—Transfer all Global Title Translation tables

gws—Transfer all Gateway Screening tables

vflex—Transfer all V-Flex tables

ip—Transfer all IP tables

all—Transfer all of the types of tables

exts—Transfer the Extended Statistics table

Example

```
act-ftp-trns:action=put:filetype=gtt
```

Dependencies

This command cannot be entered if another file transfer is already in progress.

The **action** and **filetype** parameters must be specified in the command.

The FTP Server table must be accessible.

The FTP Server table must contain at least one FTP server entry that specifies the **user** application

An IPSM card must be in service before this command can be entered.

Notes

This command communicates with the **user** application, defined in the FTP Server table. The IP address and server details necessary for an FTP transfer are also stored in the FTP Server table. One such **user** application is the FTP-based Table Retrieve Application (FTRA). Refer to the *FTP-Based Table Retrieve Application (FTRA) User Guide* for the **user** application to configure an FTP Server table entry.

Output

```
act-ftp-trns:action=put:filetype=ip
tekelecstp 09-05-06 06:41:17 EST EAGLE 41.0.0
FTP command sent to IPSM card - Processing
;

tekelecstp 09-05-06 06:41:17 EST EAGLE 41.0.0
Copy-table started - tablexxx.tbl
Copy-table COMPLETE.
;

tekelecstp 09-05-06 06:41:17 EST EAGLE 41.0.0
FTP file transfer started - tablexxx.tbl
FTP file transfer SUCCESSFUL.
;

tekelecstp 09-05-06 06:41:17 EST EAGLE 41.0.0
FTP transfer COMPLETE.
;
```

act-gpl

Activate Generic Program Load

Use this command to change the status of the trial GPL from “trial” to “approved.” The status of the previously approved GPL is changed to “trial.”

Keyword: act-gpl

Related Commands: chg-gpl, copy-gpl, rept-stat-gpl, rtrv-gpl

Command Class: Program Update

Parameters

NOTE: As of Release 43.0, the **BLBEPM**, **BLBIOS**, **BLBSMG**, **BLCPLD**, **BLDIAG6**, **BLROM1**, **BLVXW6**, **IMTPCI**, and **PLDPMC1** GPLs are replaced with the **BLIXP** GPL. The replaced GPLs are used only during upgrade to Release 43 and hardware replacement.

:gpl= (mandatory)

Generic program load. This parameter specifies the name of the GPL identifier to be moved from "trial" to "approved" status on the disk.

Range: *xyyyyyyy*

1 alphabetic character followed by up to 7 alphanumeric characters. Valid GPLs are:

atmansi—Used by LIM cards to support the high-speed ATM signaling link feature

atmhc—Used by E5-ATM and E5-ATM-B cards to allow the card to support up to 3 signaling links

atmitu—Used by E1 ATM cards to support the high-speed E1 ATM signaling link feature

blbepm—Flash GPL containing the BIOS ROM image on E5-E1T1, E5-ENET, and E5-ENET-B cards

blbios—Flash GPL containing the BIOS ROM image on HC-MIM cards that are used for E1 or T1 signaling links

blbsmg—Flash GPL containing the BIOS ROM image on E5-SM4G cards

blcpld—Flash GPL containing the bit files for the CPLD on HC-MIM, E5-E1T1, E5-ENET, and E5-ENET-B cards that are used for E1 or T1 signaling links

bldiag6—Flash GPL containing the diagnostic code on E5-E1T1, HC-MIM, E5-ENET, and E5-ENET-B cards

blixp—Flash GPL containing a tar image with all code required on E5-E1T1, HC-MIM, E5-ENET, and E5-SM4G cards

blmcap—Flash GPL containing a tar image with all code required on E5-MCAP, E5-ATM-B, E5-ENET-B, E5-MCPM-B and E5-SM8G-B cards

blrom1—Flash GPL containing the bootloader code for VxWorks operating system on HC-MIM cards

blvxw6—Flash GPL containing the VxWorks operating system on E5-E1T1, and E5-ENET cards that are used for E1 or T1 signaling links.

bpdcn—Used to support the flash memory Board PROM for DCM, DSM, and GPSM boards, original design

bpdcn2—Used to support the flash memory Board PROM for DCM and GPSM boards, revised design

bphcap—Used to support Board PROM for HCAP flash memory

bphcapt—Supports Board PROM for HCAP-T flash memory

bphmux—Supports Board PROM for HMUX flash memory

bpmpl—Supports Board PROM for MPL flash memory

bpmp1t—Supports Board PROM for E1/T1 flash memory

cd—Used in the card manufacturing process.

eoam—Used by the GPSM-II card for enhanced OAM functions

eroute—Used by STC cards for EAGLE 5 Integrated Monitoring Support functions

erthc—Used by E5-ENET and E5-ENET-B cards when the card acts as an STC card (E5-STC card) for EAGLE 5 Integrated Monitoring Support functions

gls—Used by TSM cards to download gateway screening to LIM cards

gls hc—Used by E5-TSM cards to download gateway screening to LIM and SCCP cards

hipr—Communication software used on the High Speed IMT Packet Router (HIPR) card

hipr2—Communication software used on the High Speed IMT Packet Router (HIPR2) card

imt—Communication processor on the logical processing element (LPE)

imtpci—Communication software that operates the IMT bus on HC-MIM, E5-E1T1, E5-ENET, and E5-ENET-B cards

ipghc—Used by E5-ENET and E5-ENET-B cards to support point-to-multipoint IP connectivity for ANSI and ITU point codes

ipgwi—Used by SSED CM, E5-ENET, and E5-ENET-B cards for point-to-point IP connectivity for ITU point codes

iplhc—Used by E5-ENET and E5-ENET-B cards for point-to-point IP connectivity for ANSI and ITU point codes

iplim—Used by SSED CM, E5-ENET, and E5-ENET-B cards for point-to-point IP connectivity for ANSI point codes

iplimi—Used by SSED CM, E5-ENET, and E5-ENET-B cards for point-to-point IP connectivity for ITU point codes

ips—Used by IPSM cards for the IP User Interface feature

ipsg—Used by E5-ENET and E5-ENET-B cards to support the combined functionality of IPLIMx M2PA and IPGWx M3UA

ips hc—Used by E5-IPSM and E5-ENET-B cards to support the IPS application

mcp—Used by MCPM cards for the Measurements Platform feature

mcp hc—Used by E5-MCPM-B cards for the Measurements Platform feature

oam hc—Used by E5-MCAP cards for enhanced OAM functions

pldpmc1—Flash GPL used on HC-MIM and E5-E1T1 cards for E1 and T1 signaling links

sccp hc—Used by E5-SM4G and E5-SM8G-B cards to support EPAP-based features and the LNP ELAP Configuration feature when no EPAP-based or LNP ELAP Configuration feature is turned on and the card acts as an STC card (E5-STC card) for EAGLE 5 Integrated Monitoring Support functions.

slan hc—Used by E5-ENET and E5-ENET-B cards to support the STPLAN application

ss7 hc—Used by HC-MIM and E5-E1T1 cards. Allows the card to support up to 64 signaling links for E1 and T1 functions.

ss7ipgw—Used by SSED CM, E5-ENET, and E5-ENET-B cards to support point-to-multipoint IP connectivity

ss7ml—Used by MPL and E1/T1 MIM cards. The GPL allows MPL cards to support 8 signaling links. MPL cards support only the DS0 interface. The GPL allows the E1/T1 MIM card to support 8 signaling links for E1 and T1 functions.

utility—Used by the factory for testing, and when directed by the Customer Care Center

vcdu—Used in the card manufacturing process

vsc cp—Used by Service Module cards to support the EPAP-based and the LNP ELAP Configuration features. If no EPAP-based or LNP ELAP Configuration feature is

turned on, and if a Service Module card is present, then the GPL processes normal GTT traffic.

vxwslan—Used by SSED CM, E5-ENET, and E5-ENET-B cards to support the STPLAN application

:ver= (mandatory)

Version. This parameter specifies the version number of the GPL to be activated, with subfields the format of *major-minor-fix* separated by dashes.

Range: *major-minor-fix*

Specify a value in the range **0–255** for each subfield of the GPL version number (*major-minor-fix*).

Example

```
act-gpl:gpl=ss7hc:ver=125-1-0
```

Dependencies

No other activate, change, copy, or retrieve GPL commands, nor a GPL audit, can be in progress when this command is entered.

The value specified for the **gpl** parameter must be supported. See the **gpl** definition for a list of supported GPLs.

Notes

Test the trial GPL by loading to a card before activating the GPL. Activating the GPL changes it from *trial* to *approved*.

The generic program load is committed on the active system and on the standby system.

Trial GPLs are downloaded to cards manually. Only approved GPLs can be downloaded to cards by the system.

Use the **rtrv-gpl** command to determine the version of the GPL.

Output

The output indicates that the specified GPL is activated on each TDM card.

```
act-gpl:gpl=ss7hc:ver=125-1-0
```

```
tekelecstp 05-01-03 16:53:23 EST EAGLE5 33.0.0
SS7HC activate to 1114 completed
SS7HC activate to 1116 completed
```

```
;
```

The number of "cards of x complete" represents the total number of cards that can communicate on the IMT at the instant that this information is displayed.

```
act-gpl:gpl=imt:ver=21-2-0
```

```
tekelecstp 05-04-24 06:54:39 EST EAGLE 34.0.0

act-ip-lnk**Activate IP Link**

Use this command to activate an IP link and put the link into service. The state of the link is changed from OOS-MT-DSBLD (Out-Of-Service-Maintenance-Disabled) to OOS-MT (Out-Of-Service-Maintenance), IS-ANR (In-Service-Abnormal), or IS-NR (In-Service-Normal).

NOTE: The specified card must be Active before the command can be executed. If the card boots, then the status of the IP link will be reset.

Keyword: act-ip-lnk

Related Commands: dact-ip-lnk, rept-stat-card, rept-stat-mon

Command Class: Link Maintenance

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118, 1113, 1115

:port= (mandatory)

Ethernet interface Port ID.

Range: a, b, fca, fcb
 a — IP Port A
 b — IP Port B
 fca — Fast Copy Port A
 fcb — Fast Copy Port B

Example

```
act-ip-lnk:loc=1102:port=a
```

```
act-ip-lnk:loc=1203:port=fca
```

Dependencies

The value specified for the **loc** parameter must refer to one of the following cards, and the referenced card must be equipped:

- E5-ENET or E5-ENET-B card running the EROUTE, IPGWx, IPLIMx, IPSG, or SLAN application
- E5-IPSM or E5-ENET-B card running the IPS application
- E5-SM4G or E5-SM8G-B card running the VSCCP application
- E5-OAM card running the OAMHC application
- E5-MCPM-B card running the MCP application

A valid value must be specified for the **loc** parameter.

The value specified for the **port** parameter must be supported by the card:

- E5-OAM card running OAMHC application, E5-IPSM or E5-ENET-B card running the IPS application, E5-MCPM-B card running the MCP application, E5-ENET or E5-ENET-B card running the SLAN application — port a only

- E5-ENET or E5-ENET-B card running the EROUTE or IPLIMx application, E5-SM4G or E5-SM8G-B card running the VSCCP application — port **a, b**
- E5-ENET or E5-ENET-B card running the IPGWx or IPSG application — port **a, b, fca, fcb**

The card at the specified location must be configured.

The card in the specified location must be Active before the **act-ip-lnk** command can be executed.

Output

act-ip-lnk:loc=1101:port=a

Command Accepted - Processing

```
tekelecstp 11-08-16 19:52:01 MST EAGLE 44.0.0
act-ip-lnk:loc=1101:port=a
Command entered at terminal #1.
```

;

```
tekelecstp 11-08-16 19:52:01 MST EAGLE 44.0.0
Activate IP link message sent to card.
```

;

```
tekelecstp 11-08-16 19:52:01 MST EAGLE 44.0.0
Command Completed.
```

;

act-lbp

Activate Loopback Point Test

Use this command to activate one or more loopback point tests for testing data signaling link elements in an SS7 transmission path. Use this command to:

- Activate a test for a specified loopback point that is defined in the LFS database table
- Activate a test for one loopback point that is not defined in the LFS database table
- Activate tests for all loopback points that have been defined in the LFS database table. See "Summary of Loopback Testing Commands and Functions" for information about loopback testing commands and functions.

The **ent-lbp** command can be used to define a maximum of 32 loopback points in the LFS database table.

Keyword: **act-lbp**

Related Commands: **chg-lbp, dact-lbp, dlt-lbp, rept-stat-lfs, rtrv-lbp**

Command Class: Database Administration

Parameters

To activate a test for a single loopback point that is defined in the LFS database table, specify the loopback point number in the **lbp** parameter and do not specify any of the **lfst**, **rle**, **rep**, and **cli** parameters in the command. Information from the LFS database is used to activate the test for the specified loopback point.

To activate a test for a single loopback point that is not defined in the LFS database table, specify one or more of the **lfst**, **rle**, **rep**, and **cli** parameters in the command. (If the **cli** parameter is not

specified, the **cli** value is blank, a null string. If the **rep** parameter is not specified, the default value is **0**.)

To activate tests for all loopback points that are defined in the LFS database, do not specify any of the **lbp**, **lfst**, **rle**, **rep**, and **cli** parameters in the command. Information from the LFS database table is used to activate tests for all defined loopback points.

:link= (mandatory)

SS7 signaling link. This parameter specifies the SS7 signaling link to be tested.

Synonym: **port**

Range: **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling link ports.

:loc= (mandatory)

The location of the card containing the signaling link to use for loopback point testing.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

:cli= (optional)

Common language location identifier. This parameter specifies the CILLI code or other mnemonic identifier, used to refer to the given loopback point.

Range: *ayyyyyyyyyy*

1 alphabetic character followed by up to 10 alphanumeric characters

Default: If the **rle**, **lfst**, or **rep** parameter is specified—null string (blank)

If the **rle**, **lfst**, or **rep** parameter is not specified—the value in the LFS database

:data= (optional)

This parameter specifies the data used with the *octet* or *alternate* patterns.

Range: **1-255**

Default: **255**

:force= (optional)

The **force=yes** parameter must be specified to start a test when there are 256 or more tests already running.

Range: **yes, no**

Default: **no**

:lbp= (optional)

Loopback point ID. This parameter specifies a far-end loopback point that lies along an SS7 signaling link path between the STP and the target device (up to *and including* the target device).

Range: **1-32**

Default: If the **rle**, **cli**, **rep**, or **lfst** parameter is specified, the default is **1**.

If the **rle**, **cli**, **rep**, and **lfst** parameters are not specified, the default is all loopback points found in the LFS database (up to 32 loopback points), as shown in the **rtrv-lbp** command output.

:lfst= (optional)

Link fault sectionalization test.

This parameter is mandatory if the **rle**, **cli**, or **rep** parameter is specified.

Range: **llt, mlt, nlt**

llt— latching loopback test; a software latch is set at the test point to reverse everything that is received and return it to the sender until the test is complete

mlt— manual latch loopback test; an external hardware latch is set to reverse everything that is received and return it to the sender until the test is complete (for equipment that cannot set a software latch for the test)

nlt— nonlatching loopback test; no permanent latch is set. Loopback codes are alternated with test data until the test is complete.

Default: The value in the LFS database, as shown in the **rtrv-lbp** command output

:maxerr= (optional)

Bit error threshold. This parameter specifies the actual number of errors allowed for a specific time period during which loopback testing is being performed. If this threshold is exceeded, the *TEST STATUS* field in the output report indicates an error.

Range: 0-4838400

Default: 56

:pattern= (optional)

This parameter specifies the type of test pattern used to perform the LFS test.

Range: b2047, b511, octet, alternate

b2047— 047-bit Bert pattern sent until it is stopped by software

b511— 511-bit Bert pattern sent until it is stopped by software

octet— Data (from the **data** parameter) sent continuously until it is stopped by software

alternate— Alternately, a count of 100 octets of the specified data (from the **data** parameter) followed by 100 octets of 0, sent until it is stopped by the software

The **octet** and **alternate** values are valid only when **lfst=llt** is specified.

Default: b2047

:rep= (optional)

Repetition count. This parameter specifies the number of link elements of the same type (not including the target device) that lie between the STP and the link element to be tested.

Range: 0-31

Default: If the **rle**, **cli**, **rep**, or **lfst** parameter is specified, the default is 0.

If the **rle**, **cli**, **rep**, or **lfst** parameter is not specified, the default is the value in the LFS database, as shown in the **rtrv-lbp** command output.

:rle= (optional)

Remote link element. This parameter specifies the link element to be looped back for testing.

This parameter is mandatory if the **lfst**, **cli**, or **rep** parameter is specified.

Range: ds0, ocu, csu, dsu, nei

Default: The value from the LFS database, as shown in the **rtrv-lbp** command output

:time= (optional)

This parameter specifies the length of time the test must be run in order to determine success or failure. If the number of errors that actually occur during this time exceeds the threshold set by the **maxerr** parameter, the loopback test is identified as a failure.

Range: 1-240000

hhmmss—*hh*=hours (00-24), *mm*=minutes (00-59), *ss*=seconds (00-59)

For example, **time=1** or **time=000001** is one second; **time=240000** is 24 hours;

time=200 or **time=000200** is 2 minutes

Default: 1 second

Example

Activate tests for all loopback points that are defined in the LFS database table:

```
act-lbp:loc=1205:link=b:pattern=alternate:maxerr=10:time=000200
```

Activate a test for a single loopback point that is not defined in the LFS database table:

```
act-lbp:loc=1205:link=b:lbp=1:rle=ds0:lfst=llt:clli=rlghncxa05w
act-
lbp:loc=1205:link=b:lbp=1:rle=ds0:lfst=llt:clli=rlghncxa05w:patte
rn=octet:data=h' ff
act-
lbp:loc=1205:link=b:lbp=1:rle=ds0:lfst=llt:clli=rlghncxa05w:maxerr=40:time=12000
```

Activate a test for a single loopback point that is defined in the LFS database table:

```
act-
lbp:loc=1205:link=b:lbp=3:pattern=alternate:maxerr=10:time=000200
```

Dependencies

The Link Fault Sectionalization (LFS) feature must be on before this command can be entered.

If the **rle=nei** parameter is specified, the **rep=0** parameter must be specified.

The **rep** parameter can be specified only if the **lfst=llt** parameter is specified.

The **rle=ds0** or the **rle=nei** parameter cannot be specified if the **lfst=nl** parameter is specified. The DS0 and Network Element Interface (NEI) link elements do not support non-latching loopbacks.

If one or more of the **rle**, **rep**, **lfst**, or **clli** parameters are specified, the database is not used to look up their values; therefore, the **lfst** and **rle** parameters must be specified when the **rep** or **clli** parameter is specified.

The **data** parameter can be specified only if the **pattern=octet** parameter or **pattern=alternate** parameter is specified.

The **pattern=octet** and **pattern=alternate** parameters cannot be specified for non-latching tests (**rle=nl**).

The card location (**loc** parameter) must contain a provisioned and equipped **limds0**, **limt1**, or **limch** (associated with a **limt1**) card configured with either an **ss7ansi** or **ccs7itu** application.

The card in the **loc** parameter location must be in the In-Service-Normal state.

The signaling link that is used for LFS testing must be equipped, and must be deactivated before this command is entered.

The loopback points (LBPs) must have been previously defined in the database.

Only one LFS test can be active on a signaling link at a time.

This command cannot be entered for a signaling link LFS test when the maximum number of LFS tests are active for the card. At least one LFS test must complete before this command can be entered again.

On LIM-AINF, LIM-ILA, LIM-EILA, and MPL cards (type LIMDS0 cards), only one LFS test can be active on a card at a time.

On the following cards, up to 8 LFS tests can be active on a card at a time:

- E1/T1 MIM cards or HC-MIM cards used as T1 cards
- E1/T1 MIM cards used as LIMCH cards associated with a T1 card
- MPL-T cards (type LIMDS0)

This command cannot be entered when the maximum combined total number of LFS and link tests (1024) are in progress in the system. At least one test must complete before this command can be entered again.

The **force=yes** parameter must be specified to activate a test when there are 256 or more tests already running in the system.

The specified signaling link must not be running a **tst-slk** test when this command is entered. The **tst-slk** test must be stopped or allowed to complete before this command can be entered for the link.

The specified signaling link must not be in Command Driven Loopback (CDL) when this command is entered. The link must be removed from CDL before this command can be entered for the link.

This command cannot be entered for a link that is already blocked by another link diagnostic test. The test must be canceled or allowed to complete before this command can be entered for the link.

LFS testing is not available during upgrade.

The maximum number of loopback point entries allowed in the LFS table is 32.

Notes

The **act-lbp** command is not supported for **limatm** cards.

If an LFS test is aborted by a card reset, it can leave the remote far-end loopback condition active. Use the **dact-lbp** command to cancel LFS tests.

The E1/T1 MIM card and the HC-MIM card support this command on up to 8 T1 channels at a time; the command is not supported for E1.

The test can terminate with the status "ERROR, bit error exceeded threshold" for two reasons.

- The number of cumulative bit errors exceeds the specified **maxerr** parameter value.
- The number of bit errors for one second reaches or exceeds 255, without considering the **maxerr** parameter value.

Output

The LFS report is displayed when the LFS test completes.

The following example shows how the test failed because the bit error rate exceeded the threshold. Here the **maxerr=10** parameter is used for a test time of 2 minutes. Because more than 10 errors occurred within 2 minutes, the test is considered a failure and the **TEST STATUS** field displays the cause. The parameter values are applied to each loopback point. The **maxerr** value is per test, not cumulative for all tests.

```
act-lbp:loc=1205:link=b:pattern=alternate:maxerr=10:time=002000
```

```
tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
LOC = 1205 Link = B LSN = ls11345678 Start time = 11:10:34
```

```
PATTERN = ALTERNATE DATA= FF MAXERR = 10 TIME = 00:02:00
```

```
TEST STATUS = ERROR, bit error exceeded threshold.
```

LBP	CLLI	RLE	REP	LFST	BIT_ERROR	ERRORED_SEC	DURATION
2	rlghncxa05w	DSO	0	LLT	0	0	00:02:00
3	-----	OCU	0	NLT	8	2	00:02:00
5	-----	NEI	0	LLT	15	1	00:01:20

```
;
```

In the following example, the test failed because the loopback could not be established.

```
act-lbp:loc=1205:link=b:pattern=alternate:maxerr=10:time=000200
```

```
tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
LOC = 1205 Link = B LSN = ----- Start time = 11:10:34
```

```
PATTERN = ALTERNATE DATA= FF MAXERR = 10 TIME = 00:02:00
```

```
TEST STATUS = ERROR, loopback was not established.
```

1	rlghncxa05w	DSO	0	LLT	0	0	00:00:00

```
;
```

Legend

LOC—Card location that contains the signaling being tested.

LINK—Signaling link that is being tested on the card.

LSN—Name of the linkset that contains the link being tested.

START TIME—Time that the test started.

PATTERN—Type of test pattern used to perform the LFS test.

DATA—Data used with the **octet** or **alternate** patterns.

MAXERR—Bit error threshold; actual number of errors allowed for the specific time period during which loopback testing is being performed. If this threshold is exceeded in the specified time period, the **TEST STATUS** field in the output report indicates an error.

TIME—Specified length of time to run the test in order to determine success or failure. If the number of errors that actually occur during this time exceeds the threshold set by the **maxerr** parameter, the loopback test is identified as a failure.

TEST STATUS—Any one of the following **TEST STATUS** values can appear:

- PASS
- ERROR, LFS HARDWARE is not available.
- ERROR, loopback could not be established.

- ERROR, bit error exceeded threshold.
- ERROR, LFS test aborted.
- ERROR, LFS hardware failed.

LBP—Loopback point used to perform the LFS test.

CLLI—Common Language Location Identifier (CLLI) code, or other mnemonic identifier, used to refer to the given loopback point.

RLE—Remote link element to be looped back for testing.

REP—Repetition count. The number of link elements of the same type (not including the target device) that lie between the STP and the link element to be tested.

LFST—Type of link fault sectionalization loopback test to be performed.

BIT_ERROR—The number of bit errors observed during the test.

ERRORED_SEC—The number of seconds that contained bit errors during the test. (Bit errors are sampled once per second; each sample that contains bit errors adds one second to this count.)

DURATION—Length of time that the test actually ran for the loopback point. For successful test, the TIME and the DURATION should be the same. If a test ran for less than the specified amount of time, the DURATION will be less than the TIME.

act-lpo

Activate Local Processor Outage

Use this command to force a processor outage on the specified link. The system begins sending link status signal units (LSSUs) with a status of SIPO to the adjacent signaling point. Level 2 status remains in service, except when the link is an ATM high-speed signaling link.

NOTE: The signaling link's blocked status is not preserved across a LIM reboot.

Keyword: act-lpo

Related Commands: blk-slk, canc-lpo, rept-stat-slk, ublk-slk

Command Class: Link Maintenance

Parameters

:link= (mandatory)

The signaling link on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

Synonym: port

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling links.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

```
act-lpo:loc=1101:link=a
```

Dependencies

A card location that is valid and defined in the database must be specified.

No other action command can be in progress when this command is entered.

If the card in the specified location is running the IPLIM or IPLHC GPL, then the specified link must have an **ipliml2** parameter value of **m2pa**.

This command is not valid for cards running the SS7IPGW, IPGWI, or IPGHC GPL.

The card must contain signaling links.

The signaling link must be equipped in the database.

This command is not valid for links belonging to proxy linksets.

The value specified for the **loc** parameter must refer to one of the following cards, and the referenced card must be equipped:

- E1-ATM card running the ATMITU application
- E1/T1 MIM, E5-E1T1, or HC-MIM card running the SS7ANSI or CCS7ITU application
- E5-ATM or E5-ATM-B card running the ATMANSI or ATMITU application
- E5-ENET or E5-ENET-B card running the IPSG application
- E5-ENET, E5-ENET-B, or SSEDCEM card running the IPLIM or IPLIMI application
- LIM card running the SS7ANSI or CCS7ITU application
- LIM-ATM card running the ATMANSI application

An appropriate value must be specified for the **link** parameter when an ATM card is used:

- **a**—E1-ATM card running the ATMITU application or the LIM-ATM card running the ATMANSI application
- **a-a1, b**—E5-ATM or E5-ATM-B card running the ATMANSI or ATMITU application

Notes

The function of this command is the same as the **blk-slk** command.

This command generates an alarm.

If the **act-lpo** command is followed by the **init-card** command, the local processor outage is not preserved after the **init-card** command completes.

The *Installation Manual - EAGLE 5 ISS* provides an illustration of card locations.

If the **blk-slk** or **act-lpo** command is issued for an IPSG signaling link, then one of the following events occurs:

- IPSG-M2PA signaling link—MTP3 local processor outage is initiated.
- IPSG-M3UA signaling link—The link is prohibited from entering service by rejecting received AS-ACTIVE messages.

Output

```
act-lpo:loc=1101:link=a
tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
Local processor outage being set.

tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
* 0014.0208 * SLK 1101,A nc00027 slk local blocked
```

act-oap-config**Activate OAP Configuration**

Use this command to update the OAPs with the configuration data entered into the EAGLE 5 ISS database with the **chg-oap-config** command.

The **act-oap-config** command also sends the EAGLE 5 ISS Site ID to the OAPs. See the **chg-sid**, **ent-lnp-serv**, and **chg-lnp-serv** commands for more information.

CAUTION: Before the **act-oap-config** command can be entered, the EAGLE 5 ISS database must be provisioned with required data for the SEAS feature, depending on which of those features are turned on. If this information is left blank or incorrectly provisioned, and the **act-oap-config** command is entered, the OAP may lose SEAS connectivity. The requirements are discussed in the Dependencies section for this command.

NOTE: As of Release 42.0, this command is obsolete.

Keyword: **act-oap-config**

Related Commands: **chg-lnp-serv**, **chg-oap-config**, **chg-sid**, **dlt-lnp-serv**, **ent-lnp-serv**, **rtrv-lnp-serv**, **rtrv-oap-config**, **rtrv-sid**

Command Class: Database Administration

Parameters

:force= (optional)

Force the EAGLE 5 ISS to provision only one OAP in a dual OAP configuration.

Range: **yes, no**

Default: **no**

:oap= (optional)

The OAP being updated.

Range: **a, b, all**

Default: **all**

Example

```
act-oap-config:oap=a:force=yes
```

Dependencies

Additional data that is not shown in the **rtrv-oap-config** command output must also be provisioned in the database before the OAP configuration can be updated:

- Feature—SEAS
- Data—EAGLE 5 ISS CLI - configured with the **cli** parameter of the **chg-sid** command

To keep OAP parameters in sync with the EAGLE 5 ISS, a checksum is created using all of the OAP configuration data stored on the EAGLE 5 ISS. The OAP also calculates this checksum based on the data it has. The OAP returns this checksum every 5 seconds. The EAGLE 5 ISS compares the checksums and generates the following alarm within 10 seconds of any mismatch.

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
* nnnn.0364 * OAP A Configuration data checksum mismatch
```

The alarm is cleared when a maintenance poll returns a checksum that matches the EAGLE 5 ISS' checksum, indicating that the databases are back in sync. The EAGLE 5 ISS clears the alarm within five seconds. The following UAM clears the alarm:

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
nnnn.0365 OAP A Configuration data checksum alarm cleared
```

If the **oap=a**, **oap=b**, or **oap=all** parameter is specified with the **act-oap-config** command, then the link from the EAGLE 5 ISS to the specified OAP must be in service.

If the **oap=a** or **oap=b** parameter is specified, the **force=yes** parameter must be specified.

The SEAS Over IP feature must be turned off before this command can be entered.

Notes

To configure the OAP from the EAGLE 5 ISS, the procedure "Configuring the OAP from the EAGLE 5 ISS STP Terminal" in the *System Manual – EOAP* is recommended.

It is recommended that only one OAP be updated at a time. Although the **act-oap-config** command completes immediately on the EAGLE 5 ISS, processing on the OAP may take over 10 minutes depending on which parameters changed and which OAP hardware is installed. Also, whenever some parameters are changed, the OAP reboots to use the new data. The reboot interrupts the connection between that OAP and the SEAC. By updating only one OAP at a time, the EAGLE 5 ISS and the SEAC will not be isolated, as one OAP is always connected to the SEAC.

The OAP is named and addressed according to the terminal port number on the EAGLE 5 ISS control shelf backplane that the OAP is connected to. The terminal ports are numbered from MMI 0 to MMI 15. OAP A is connected to the lower numbered terminal port and OAP B is connected to the higher numbered terminal port. If the terminal port connections for the OAPs change, the names for OAPs A and B could be reversed. For example, OAP A is connected to MMI 3 and OAP B is connected to MMI 9. At some later time, OAP A is moved from MMI 3 to MMI 12. Because of this move, OAP A is now OAP B, and what was OAP B is now OAP A.

Output

```
act-oap-config:oap=a:force=yes
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
ACT-OAP-CONFIG: MASP A - COMPLTD
;
```

act-slk

Activate Signaling Link

Use this command to change the link from OOS-MT-DSBLD (Out-of-Service-Maintenance-Disabled) to IS-NR (In-Service-Normal).

NOTE: The signaling link's activated status is preserved across a card reboot.

Keyword: act-slk

Related Commands: blk-slk, dact-slk, dlt-slk, ent-slk, inh-slk, rept-stat-slk, rtrv-slk, tst-slk, ublk-slk, unhb-slk

Command Class: Link Maintenance

Parameters

:link= (mandatory)

The signaling link on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

Synonym: **port**

Range: **a, b, a1-a31, b-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Example

```
act-slk:loc=1301:link=a
```

Dependencies

The value specified for the **loc** parameter must refer to one of the following cards, and the referenced card must be equipped:

- E1-ATM card running the ATMITU application
- E1/T1 MIM, E5-E1T1, or HC-MIM card running the SS7ANSI or CCS7ITU application
- E5-ATM or E5-ATM-B card running the ATMANSI or ATMITU application
- E5-ENET or E5-ENET-B card running the IPSG application
- E5-ENET, E5-ENET-B, or SSEDCCM card running the IPLIM, IPLIMI, SS7IPGW, or IPGWI application
- LIM card running the SS7ANSI or CCS7ITU application
- LIM-ATM card running the ATMANSI application

This command cannot be entered while the **tst-slk** command is in progress.

A card location that is defined in the database must be specified.

The card must contain signaling links.

No other action command can be in progress when this command is entered.

The specified signaling link must be provisioned in the database.

An appropriate value must be specified for the **link** parameter when an ATM card is used:

- **a**—E1-ATM card running the ATMITU application or the LIM-ATM card running the ATMANSI application
- **a-a1, b**—E5-ATM or E5-ATM-B card running the ATMANSI or ATMITU application

Notes

The *Installation Manual - EAGLE 5 ISS* provides an illustration of card locations.

Keyword: alw-card

Related Commands: dlt-card, ent-card, inh-card, init-card, rept-stat-card, rmv-card, rst-card, rtrv-card

Command Class: System Maintenance

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:code= (optional)

This parameter specifies the GPL type to be loaded.

CAUTION: Do not enter the **pktgen**, **utility**, or **inactiveprtn** values for this parameter unless instructed to do so by Tekelec personnel.

Range: **appr**, **pktgen**, **trial**, **utility**, **inactiveprtn**

appr — Downloads the approved GPL

pktgen — Downloads the **pktgen** GPL for the appropriate hardware type. This GPL is to be used only for engineering test purposes and must not be used in customer installations without engineering oversight.

trial — Downloads the trial GPL

utility — Downloads the CDU or VCDU GPL for the appropriate hardware type. This GPL is used primarily by the factory for testing purposes.

inactiveprtn — Downloads the MASP with associated GPL from the inactive partition of the TDM. This value should be specified only during a software upgrade.

After the **pktgen** GPL is initially downloaded to a card by the **alw-card** command, the **pktgen** GPL will continue to be downloaded to the card until another **alw-card** command is issued.

Default: **appr**

:data= (optional)

High memory refresh. This parameter causes data to be reloaded to the specified card.

NOTE: Various conditions in the system may prevent the persistence of the data on the cards.

Range: **refresh**, **persist**

refresh — Causes data to be reloaded to the specified card.

persist — Indicates that the database is not to be reloaded to the card. This parameter is used to request that the EAGLE 5 ISS perform a warm restart of the requested cards. The EAGLE 5 ISS performs various checks to ensure that all conditions necessary to initiate the warm restart are in place. During the card initialization and loading sequence, a warm restart is performed if the card meets the warm restart conditions, as described in the Notes section of this command.

Default: **refresh**

Example

```
alw-card:loc=2301:code=trial
```

```
alw-card:loc=1101:data=persist
```

Dependencies

The active and standby TDM card locations and the card location that is running the active OAM cannot be specified in the **loc** parameter.

The shelf and card must be equipped.

No other action command can be in progress when this command is entered.

The G-Flex, G-Port, INP, LNP, or V-Flex feature must be turned on, or the ATINP feature must be enabled before the **data** parameter can be specified.

The **data** parameter is valid only for SCCP card locations or GPLs, or MPS database (VSCCP) card locations or GPLs.

A card that is the active MASP cannot be specified for the **loc** parameter.

A card location that is valid and defined in the database must be specified.

If an OAM card is installed in the location specified by the **loc** parameter, then only a value of **inactiveprtn** is supported for the **code** parameter.

Notes

The function of this command is the same as the **rst-card** command.

The *Installation Manual - EAGLE 5 ISS* provides an illustration of card locations.

The system previously supported the **data** parameter for reloading GTT data. The system does not support persistent GTT data loading, and the **data** parameter is now used in support of a warm restart feature.

A number of reasons exist for not being able to warm restart. If none of these conditions exists, a warm restart is possible and will be attempted following a Service Module card reset.

- The following conditions require a full data reload:
 - **AUDIT FAILED**—The checksum comparisons of the LNP database failed during card initialization. Data on the card is determined to be corrupted after the reset (was not yet detected by normal auditing).
 - **AUDIT TIMEOUT**—The LNP initialization audit timed out (software failure).
 - **DB LEVEL**—The database level is not supported, or the difference exceeds incremental loading capability. This condition is caused by the reset of OAMs or if the number of updates exceeds the incremental loading capability.
 - **DB STATUS**—The database status of the card is incoherent at the time of a reset. This condition can be caused by a failed network card update or a reset during a database update to the card.
 - **DB VERSION**—The LNP Database version has changed from the previous version. An import, or bulk downloads (**chg-db**), or changes from release to release may alter the database version.
 - **HW ERROR**—The hardware error bit checks on the card failed during card initialization.
 - **NO AUDIT**—Unable to perform an LNP audit. The LNP audit is not on (for example, LNP options has **audit=off**). This condition can occur if the rate of LNP updates exceeds the ability of the LNP audit to compute checksums (excessive unknown checksums). This condition is more likely on a small database where there are fewer checksums. The percentage of known checksums must be 99% or more. The

percentage is based on the number of checksums in use, which is smaller for small databases (such as two million TNs or fewer).

- **POWER ON**—A power on reset (the card is pulled and reinserted).
- **UNKNOWN/OTHER**—An unknown or other type of software failure.
- **USER REQUEST**—A user-initiated **init-card** or **init-sys** command **reload type=cold**. The default restart type for these commands is a cold or full LNP data reload. The user must specify **data=persist** for a warm restart on command.
- **XILINX VERSION**—The M256 Xilinx program version has changed from the previous version.

The following conditions require a cold restart for the MCPM card:

- **DB STATUS**—The database status of the card is incoherent at the time of a reset. This condition can be caused by a failed network card update or a reset during a database update to the card.
- **MEAS DB**—A measurements database Init failure or corruption.
- **POWER ON**—A power on reset (card is pulled and reinserted).
- **UNKNOWN/OTHER**—An unknown or other type of software failure.
- **XILINX VERSION**—The D1G Xilinx program version has changed from previous version.

CAUTION **CAUTION: This command can be used to enable Measurements Platform measurements collection after the collection function has been disabled with the inh-card command for ALL MCPM cards in the system. To enable collection, at least 1 MCPM card must be allowed in the system. Disabling collection by inhibiting all MCPM cards CAN RESULT IN LOSING ALL PAST MEASUREMENT DATA ON THE CARDS.**

When the OA&M IP Security feature is turned on, and an IPSM card is inserted and initialized for the first time or is removed, inserted, and initialized again, the "SSH Host Keys Regenerated" UIM is displayed. The UIM shows the generated SSH Host Key fingerprint that must be provided at the secure client in order for secure information transfer to occur. The SSH Host Key fingerprint is changed whenever power is lost and restored to an IPSM card.

```
rlghncxa03 03-07-11 07:05:00 EST EAGLE 30.2.0
0021.1493 CARD 1111 INFO SSH Host Keys Regenerated
84 7c 92 8b c 7c ds 19 1c 6 4b de 5c 8f c5 4d
Report Date:03-07-11 Time:22:27:36
```

When the OA&M IP Security feature is turned on, and an IPSM card is restarted with this command, the "SSH Host Keys Loaded" UIM is displayed. The UIM shows the current SSH Host Key fingerprint. The SSH Host Key fingerprint is not changed if the IPSM card does not lose power.

```
rlghncxa03 03-07-11 07:05:00 EST EAGLE 30.2.0

alw-imt

Allow IMT

Use this command to change the state of the specified Interprocessor Message Transport (IMT) bus from OOS-MT-DSBLD (Out-of-Service-Maintenance-Disabled) to IS-NR (In-Service-Normal), if the command is successful. If the command fails, the status is IS-ANR (In-Service-Abnormal). The IMT bus is comprised of two 125 Mbps counter-rotating serial busses. If one bus fails, the other immediately assumes control of all messages.

Keyword: **alw-imt**

Related Commands: **clr-imt-stats**, **conn-imt**, **disc-imt**, **inh-imt**, **rept-imt-lvl1**, **rept-imt-lvl2**, **rept-stat-imt**, **rmv-imt**, **rst-imt**, **tst-imt**

Command Class: System Maintenance

Parameters

:bus= (mandatory)
The IMT bus with the status to be changed.
Range: a, b

Example

```
alw-imt:bus=a
```

Dependencies

This command cannot be entered during an IMT Fault Isolation Test or an Extended Bit Error Rate Test (BERT).

This command cannot be entered if an IMT Rate Change sequence is in progress.

Notes

This command returns an inhibited IMT bus to service.

The function of this command is the same as the **rst-imt** command.

See the **tst-imt** command to determine the location of faults on a failed or abnormal IMT bus.

Output

```
alw-imt:bus=a
  rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
  Allow IMT Bus A command issued.

```

alw-map-ss**Allow Mated Application Subsystem**

Use this command to activate a subsystem and bring it online. The AIQ, ATINPQ, EIR, INP, INPQS, LNP, LNPQS, and V-Flex subsystems can be allowed and inhibited.

Keyword: **alw-map-ss**

Related Commands: **inh-map-ss, rept-stat-lnp, rept-stat-sccp**

Command Class: System Maintenance

Parameters

:ssn= (mandatory)
Subsystem number.
Range: 2-255

Example

```
alw-map-ss : ssn=10
```

Dependencies

No other action command can be in progress when this command is entered.

The system must be configured with at least one Service Module card running the VSCCP application.

The EIR, INP, LNP, or V-Flex feature must be turned on, or the ANSI41 AIQ or ATINPQ feature must be enabled before this command can be entered.

The value specified for the **ssn** parameter must be the AIQ, ATINPQ, EIR, INP, LNP or V-Flex subsystem number.

The LNP subsystem must be online before the LNPQ subsystem number can be specified as a value for the **ssn** parameter.

The V-Flex subsystem must be online before the V-Flex subsystem number can be specified as a value for the **ssn** parameter.

The ATINPQ subsystem must be online before the ATINPQ subsystem number can be specified as a value for the **ssn** parameter.

The INP subsystem must be online before the INP subsystem number can be specified as a value for the **ssn** parameter.

The EIR subsystem must be online before the EIR subsystem number can be specified as a value for the **ssn** parameter.

The AIQ subsystem must be online before the AIQ subsystem number can be specified as a value for the **ssn** parameter.

Notes

None

Output

```
alw-map-ss : ssn=11
integrat40 00-05-24 10:37:22 EST EAGLE5 31.0.0
Allow map subsystem command sent to all SCCP cards.
Command Completed.
;
```

alw-slk**Allow Signaling Link**

Use this command to return an inhibited signaling link to service. If the link was aligned when it was inhibited, a changeover occurred. This command causes a changeback on the specified link. MSUs are transmitted on the link after the changeback is issued.

NOTE: The signaling link's inhibited status is not preserved across a card reboot.

Keyword: alw-slk

Related Commands: act-slk, blk-slk, canc-slk, dact-slk, dlt-slk, ent-slk, inh-slk, rept-stat-slk, rtrv-slk, tst-slk, ublk-slk, unhb-slk

Command Class: Link Maintenance

Parameters

:link= (mandatory)

This parameter specifies the signaling link defined on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

Synonym: port

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

```
alw-slk:loc=1301:link=b
```

Dependencies

A card location that is valid and defined in the database must be specified.

No other action command can be in progress when this command is entered.

The card must contain signaling links.

The signaling link must be equipped in the database.

This command is not valid for cards running the SS7IPGW, IPGWI, or IPGHC GPLs.

The card that contains the specified signaling link must be equipped in the specified card location.

The card in the specified card location cannot be a TDM card, an MDAL card, an HMUX or HIPR card, or the cards running the OAM application.

If IPSG-M3UA signaling links are used, then this command cannot be entered.

An appropriate value must be specified for the **link** parameter when an ATM card is used:

- **a**—E1-ATM card running the ATMITU application or the LIM-ATM card running the ATMANSI application
- **a-a1, b**—E5-ATM or E5-ATM-B card running the ATMANSI or ATMITU application

Notes

The function of this command is the same as the **unhb-slk** command.

Not every card location represents a signaling link. Be sure to address a signaling link in this command.

The *Installation Manual - EAGLE 5 ISS* provides an illustration of card locations.

Output

```
alw-slk:loc=1301:link=b
tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
Allow Link message sent to card
;
```

alw-trm**Allow Terminal**

Use this command to return the specified serial port to the state IS-NR (in-service normal) from the state OOS-MT-DSBLD (out-of-service maintenance-disabled) if the command is successful. If the command is not successful, the terminal's state is OOS-MT (out-of-service maintenance).

Keyword: **alw-trm**

Related Commands: **act-echo, canc-echo, chg-trm, dact-echo, inh-trm, rept-stat-trm, rmv-trm, rst-trm, rtrv-trm**

Command Class: System Maintenance

Parameters

:trm= (mandatory)

This parameter specifies the ID of the serial or telnet port to be put into service.

Range: 1-40

Example

```
alw-trm:trm=5
```

Dependencies

No other action command can be in progress when this command is entered.

The IP User Interface feature must be enabled before terminal ports 17 through 40 can be specified in the **trm** parameter.

If a SEAS terminal is configured, then the IP address for the associated E5-IPSM or E5-ENET-B card must be specified before this command can be entered.

The SEAS Over IP feature must be turned on before a SEAS terminal can be specified.

The specified SEAS terminal cannot be auto-inhibited.

If a critical thermal alarm is raised against the E5-IPSM or E5-ENET-B card hosting the terminal, then the specified Telnet terminal cannot be returned to the IS-NR state.

The terminal specified by the **trm** parameter must be equipped.

The terminal specified by the **trm** parameter cannot be configured as **type=none** (see the **chg-trm** command).

Notes

The function of this command is the same as the **rst-trm** command.

When you attempt to return to service a terminal that is already in service, a warning message is echoed to the scroll area but no action is taken.

If a SEAS terminal is configured, then the corresponding card must be an E5-IPSM card, and the SEAS Over IP feature must be turned on before the SEAS terminal is allowed. The SEAS terminal is auto-inhibited if the IP Address for the corresponding E5-IPSM card is invalid.

Output

```
alw-trm:trm=12
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Allow message sent to terminal

rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
1062.0046      TERMINAL      12      Terminal Enabled
;
```

aud-data

Audit Data

Use this command to perform a data audit, which is used to determine the integrity of the static and dynamic databases. This command can also be used to perform a separate GPL audit.

Keyword: aud-data

Related Commands: chg-gpl, rept-stat-db, rept-stat-ddb, rtrv-gpl

Command Class: System Maintenance

Parameters

:ddbqp= (optional)

DDB quiet period. This parameter specifies the minimum DDB idle time, in milliseconds, during which no DDB updates are applied. After the quiet period, it is assumed that all DDB updates in the system have been processed, and no outstanding in-flight multi-cast updates exist.

If the idle period that is reported by the network card is less than the quiet period, then additional network responses are discarded, and the DDB audit process restarts. Up to three retries of the DDB audit process are performed by system. If all of the retry efforts fail, then the system status of the DDB audit report is marked as ABORTED.

Range: 0-5000

Default: 500

:display= (optional)

This parameter specifies whether a brief or full display is provided for the audit.

This parameter applies to static and dynamic STP databases.

Range: all, brief, except

all— For the static database, displays the checksum values, in hexadecimal, and details for each GPL and each subset of the current and backup database. For the dynamic database, displays the checksum values, in hexadecimal, for each dynamic database table on MTP cards.

brief— For the static database, displays the data collections for the current database, the backup database on the fixed disk, and the approved and trial GPLs. For the dynamic database, displays the system status with number of cards responded with or without checksum, the list of inconsistent cards, list of non-responding cards, number of cards not meeting quiet period requirement, number of cards responded with "DDB update in progress", and active MTP cards in system.

except— For GPLs or database subsets with problems, displays the same information as **display=all**

Default: brief

:gplqp= (optional)

GPL data audit quiet period. This parameter specifies the number of audit cycles between audits of GPL data.

NOTE: Data audits are always performed on GPLs at the first audit cycle after the EOAM or E5-OAM card recovers from a boot.

Range: 0-20
0—a GPL data audit is performed for every audit cycle

Default: No change from the current value

System

Default: 20

:tblid= (optional)

DMS Table ID. This parameter specifies the table where the checksum is performed.

Range: 0-1022

:type= (optional)

This parameter specifies the database to be audited.

Range: fixed, ddb

fixed—static database

ddb—dynamic database

Default: fixed

Example

```
aud-data:type=ddb:display=brief
```

```
aud-data:type=ddb:ddbqp=1000
```

```
aud-data:display=except
```

```
aud-data:tblid=127
```

```
aud-data:gplqp=3
```

Dependencies

Only one **aud-data** command can be in progress at a time.

If the **type=ddb** parameter is specified, then the **except** parameter cannot be specified.

If the **ddbqp** parameter is specified, then the **type=ddb** parameter must be specified.

If the **gplqp** parameter is specified, then the **tblid**, **ddbqp**, and **type=ddb** parameters cannot be specified. The **display** and **tblid** parameters cannot be specified together in the command.

The DMS table specified by the **tblid** parameter must already exist.

If the system is in upgrade mode, then this command cannot be entered.

Notes

Static Audit

The standby OAM must be available when the **aud-data** command for audit begins so that the standby OAM can receive the signal to begin auditing. If the standby OAM is not available when **aud-data** is issued, then the following messages are issued:

```
Extended Processing Time Required
Standby MASP is (or was) not available at audit start.
```

The above messages may also appear if the standby OAM is not available when the hourly periodic audit, which uses the **aud-data** command, automatically starts. The standby OAM is not performing any data auditing, so no audit results for the standby OAM are displayed in the audit report. Instead, the standby's audit results are as follows:

```
No information currently available
```

If an auditing cycle completes on either the active or standby OAM and does not produce the full set of expected results (checksums), the following message appears:

```
Audit results may be incomplete
```

The audit results may be missing some of the checksums that would normally be displayed (**display=all** or **display=except**). The results may also contain summary status information (**display=brief**) that might have been calculated differently had some of the missing checksums been available. This condition can be caused if the audit results for the backup database are missing, probably because a backup database has not been created.

If the "Audit results may be incomplete" message appears in the audit report, perform the following procedure:

Audit Data

- 1 Ensure that the standby OAM is online and ready.

- 2 Ensure that a backup database has been created. Use **rept-stat-db** command to check whether a backup database has been created. If no backup has ever been created, the output of **rept-stat-db** command shows the fixed disk backup (FD BKUP) database at level 1. There will be no information under the heading "Time Last Backup."

- 3 If necessary, create a backup on the fixed disk by entering the following command: **chg-db:action=backup:dest=fixed**

- 4 Re-enter the **aud-data** command.

If the standby OAM does not run a audit cycle and no audit information is available, the following message appears:

```
Audit results are not available
```

This condition is probably caused by the standby OAM rebooting while a audit cycle is underway. If this message appears, ensure that the standby OAM is available and re-enter the **aud-data** command. Ensure that the standby OAM remains up (is not rebooted) for the duration of the audit cycle.

Dynamic Audit

The **aud-data** command is enhanced to allow a Dynamic data audit to be triggered manually.

If a dynamic background audit is already running, and the **aud-data** command is issued for a dynamic audit, then the following message appears.

```
Periodic dynamic database audit is running with default quiet period.
Results will be displayed on completion.
```

The Standby OAM is not required for a dynamic audit.

Output

The following example shows a full display of a fixed database audit.

aud-data:display=all

```

Legend

Fixed Audit

- **CARD**—Card type
- **LOC**—Card location
- **DATA**—Type of data being audited:
 - **APPR**—Approved GPL
 - **BKUP**—Database in the backup partition
 - **CRNT**—Database in the current partition
 - **DBMM**—Database management mechanism database
 - **GLS**—GLS GPL
 - **GTT**—Global title translation database
 - **GWS**—Gateway screening database
 - **MISC**—Miscellaneous system configuration database
 - **MTP**—Message transfer part database (links, linksets, routing tables)
 - **VSCCP**—VSCCP GPL
 - **ATMANSI**—ATMANSI GPL
 - **SUBSET** or **GPL**—Indicates whether the data is a part of the database or a generic program load.
 - **TRI**—Trial GPL
- **STATUS**—Status of the database or GPL:
 - **CORRUPTED**—The database or GPL has been changed by some abnormal process. The GPL cannot be used.
 - **DIFFERENT**—The database or GPL contains information that is not consistent with the reference database or GPL
 - **OK**—The database or GPL is not corrupted and contains the same information as the reference database or GPL
- **NEW CS**—New checksum value calculated by this command
- **OLD CS**—Checksum value stored in the database or GPL
- **REF CS**—Reference checksum value stored on the active MASP

Dynamic DDB Audit

- **SYSTEM STATUS:**

- **OK**—DDB is consistent on all active MTP cards or no active MTP card is present in system
 - **INCONSISTENT**—DDB is inconsistent
 - **UNKNOWN**—"All active MTP cards in the system responded without the checksum of DDB table" or "No active MTP card in the system responded to audit request"
 - **ABORTED**—"Checksums collected failed to meet the quiet period requirement" or "Number of cards responded with "DDB update in progress" greater than 25% number of cards responded with data"
- **ACTIVE MTP CARDS**—Number of active MTP cards
 - **NON RESPONDING CARDS**—Number of non-responding cards
 - **RESPONDING CARDS**—Number of responding cards
 - **CARDS WITH NO DATA**—Cards sending replies without the checksum of dynamic tables, due to incomplete DDL crossload or DDB initialization
 - **CARDS WITH DATA**—Cards sending replies with checksums
 - **CARDS FAILING QUIET PRD**—Cards failing quiet time requirement
 - **CARDS WITH DDB UPD IN PRG**—Cards sending replies marked as "DDB update in progress" due to DDB checksum not evaluated completely or TSRC task is incomplete
 - **CARDS CONSIDERED FOR CKSM**—Cards sending correct replies. Replies are not marked with "DDB update in progress" or "Reply with no data".
 - **INCONSISTENT CARDS**—Cards that are inconsistent
 - **CONSISTENT CARDS**—Cards that are consistent
 - **AUDIT START TIME**—Time that the audit started (*DD/MM/YYYYY hh:ms:ss* format)
 - **QUIET PERIOD**—Minimum DDB idle time, in milliseconds, during which no DDB updates are applied
 - **RTE**—Checksum of RTE Table
 - **LINK SET**—Checksum of Link Set Table
 - **LINK**—Checksum of Link Table
 - **CM CARD**—Checksum of CM Card
 - **CM CLSTR**—Checksum of CM Cluster
 - **MATED APPL**—Checksum of Mated Application
 - **MTP GLOBS**—Checksum of MTP Globals Table
 - **IDLE (PERIOD)**—Time elapsed, in milliseconds, since the last DDB update was received by this card
 - **DDB UPD**—Total DDB updates received on the card
 - **ADDN'L STATUS**—Display more information for the card, including WWA updates or whether card is considered for audit calculations
 - **CAUSE**—Display the reason for sending replies of type "reply with no data " or "DDB update in progress". This value can be DDL (crossload not completed), DDB (dynamic database is

not initialised) , (TSRC, DDB) (TSRC task is not completed) or DDB (checksums still needs to apply on tables).

- ?—Card status is not evaluated (inconsistent/consistent) if the system status is marked as "ABORTED"
- **IGNORED**—Card responded with "DDB update in progress" and is not considered for calculating system status
- **WWA UPD**—Number of entries that were updated by the WWA

blk-slk

Block Signaling Link

Use this command to force a local processor outage (LPO) on the specified link. The system begins sending link status signal units (LSSU) with status of processor outage (SIPO) to the adjacent signaling point.

CAUTION: Maintenance personnel should use this command only to block MSUs from being sent to the system. Level 2 status remains in service, except when the link is an ATM high-speed signaling link.

NOTE: The signaling link's blocked status is not preserved across a card reboot.

Keyword: blk-slk

Related Commands: blk-slk, canc-lpo, rept-stat-slk, ublk-slk

Command Class: Link Maintenance

Parameters

:link= (mandatory)

This parameter specifies the signaling link defined on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

Synonym: port

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

```
blk-slk:loc=2311:link=a
```

Dependencies

A card location that is valid and defined in the database must be specified.

No other action command can be in progress when this command is entered.

The card must contain signaling links.

The signaling link must be equipped in the database.

The card that contains the specified signaling link must be equipped in the specified card location.

The card in the specified card location cannot be a TDM card, an MDAL card, an HMUX or HIPR card, or the cards running the OAM application.

If the card in the specified location is running the IPLIM or IPLHC GPL, then the specified link must have an **iplim2** parameter value of **m2pa**.

This command is not valid for links belonging to proxy linksets.

This command is not valid for cards running the SS7IPGW, IPGWI, or IPGHC GPLs.

An appropriate value must be specified for the **link** parameter when an ATM card is used:

- **a**—E1-ATM card running the ATMITU application or the LIM-ATM card running the ATMANSI application
- **a-a1, b**—E5-ATM or E5-ATM-B card running the ATMANSI or ATMITU application

Notes

The function of this command is the same as the **act-lpo** command.

This command generates a minor alarm. Refer to the *Maintenance Manual* for information on MRNs 0201 and 0208.

If the **blk-slk** command is followed by the **init-card** command, the signaling link blockage is not preserved after the **init-card** command completes.

The *Installation Manual - EAGLE 5 ISS* provides an illustration of card locations.

If the **blk-slk** or **act-lpo** command is issued for an IPSG signaling link, then one of the following events occurs:

- IPSG-M2PA signaling link—MTP3 local processor outage is initiated.
- IPSG-M3UA signaling link—The link is prohibited from entering service by rejecting received AS-ACTIVE messages.

Output

```
blk-slk:loc=2311:link=a
tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
Local processor outage being set.
;
```

In the following example, no signaling link has been defined for link a.

```
blk-slk:loc=2312:link=a
tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
Link is UNEQUIPPED in the database.
Local processor outage being set.
;
```

In the following example, slot 55 in the card location is not valid.

```
blk-slk:loc=2355:link=a
tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
Command Rejected: Slot ID out of range
;
```

Use this command to return all audible alarm indications to the local office.

Keyword: `canc-alm-trns`

Related Commands: `act-alm-trns`, `dact-alm-trns`, `rept-stat-cdt`, `rept-stat-clk`, `rept-stat-trbl`, `rls-alm`, `rtrv-obit`, `rtrv-trbl`

Command Class: System Maintenance

Parameters

This command has no parameters.

Example

```
canc-alm-trns
```

Dependencies

No other action commands can be in progress when this command is entered.

Notes

The function of this command is the same as the `dact-alm-trns` command.

After the `canc-alm-trns` command is entered, the `rept-stat-alm` command can be entered to verify the status of the alarms.

Output

```
canc-alm-trns
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Alarms returned to Local Maintenance Center
Command Completed.
;
```

canc-cmd

Cancel Command

This command halts processing and output of the following commands: `copy-ext-stats`, `rept-imt-info`, `rept-stat-applsock`, `rept-stat-as`, `rept-stat-assoc`, `rept-stat-card`, `rept-stat-clk`, `rept-stat-dstn`, `rept-stat-ls`, `rept-stat-rte`, `rept-stat-slk`, `rept-stat-trbl`, `rtrv-appl-rtkey`, `rtrv-as`, `rtrv-assoc`, `rtrv-cmd`, `rtrv-dcmps`, `rtrv-dstn`, `rtrv-gta`, `rtrv-gtt`, `rtrv-lbp`, `rtrv-log`, `rtrv-ls`, `rtrv-map`, `rtrv-mrn`, `rtrv-obit`, `rtrv-rte`, `rtrv-seculog`, `rtrv-secu-user`, `rtrv-slk`, `rtrv-tbl-capacity`, `rtrv-trbltx`, `rtrv-uaps`, `rtrv-vflx-cd`, `rtrv-vflx-rn`, `rtrv-vflx-vmsid`

NOTE: The Basic command class allows use of this command without the `trm` parameter (`dact-cmd`); the Security Administration command class is required for use of this command when the `trm` parameter is specified (`dact-cmd:trm=x`).

NOTE: Entering the `canc-cmd` command without the `trm` parameter executes the command on the terminal that is running the `canc-cmd` command. Entering the command with the `trm` parameter executes the command on the terminal specified by the `trm` parameter.

Keyword: `canc-cmd`

Related Commands: `copy-ext-stats`, `rept-imt-info`, `rept-stat-assoc`, `rept-stat-card`, `rept-stat-dstn`, `rept-stat-ls`, `rept-stat-rte`, `rept-stat-slk`, `rtrv-appl-rtkey`, `rtrv-assoc`, `rtrv-dstn`, `rtrv-gta`, `rtrv-gtt`, `rtrv-log`, `rtrv-ls`, `rtrv-map`, `rtrv-rte`, `rtrv-seculog`, `rtrv-slk`, `rtrv-trbltx`, `rtrv-uaps`, `rtrv-vflx-cd`, `rtrv-vflx-rn`, `rtrv-vflx-vmsid`

Command Class: Security Administration

Parameters

:trm= (optional)

The terminal on which the command is to be canceled.

Range: 1-40

Example

```
canc-cmd
```

```
canc-cmd:trm=3
```

Dependencies

The **trm** parameter cannot be specified in a **canc-cmd** command that is entered on the same terminal that is running the command that is to be cancelled. The terminal will return an error: system is busy.

The **canc-cmd:trm=** command requires the Security Administration command class for the terminal and for the user.

The **canc-cmd:trm** command requires a Security Administration command class for the terminal.

Notes

The **canc-cmd** command (without the **trm** parameter) must be entered on the same terminal that is running the command to be cancelled.

If the **canc-cmd** command is entered on a terminal that is not running a command, the **canc-cmd** command completes successfully without returning an error. Likewise, if the **canc-cmd:trm=** command is entered and there is no command running on the specified terminal, the **canc-cmd:trm=** command completes successfully without returning an error.

When the **canc-cmd** with no parameter is entered, a scroll area message appears to indicate that the command has been cancelled. For example:

```
Command aborted on terminal 2.
```

Some output can still appear after the above abort message if output accumulated in the output queue before the **canc-cmd** command was entered. When a command is cancelled, the cancellation should take no longer than 25 seconds to take effect.

The **F9** function key provides the same function as the **canc-cmd** command (without the **trm** parameter). On a terminal in KSR mode, pressing **<CTRL>I** also provides the same function.

The **canc-cmd** and the **F9** function key cannot be used for pure SEAS commands.

If **canc-cmd** is entered to cancel a command other than ones listed, the terminal will accept another command, but output and processing of the current command continue.

When **canc-cmd** is entered, a command status code of **AB** (command aborted) is logged in the security log as follows:

- When the **canc-cmd** (without the **trm** parameter) is entered, no entry is logged.
- When the **canc-cmd:trm=** command is entered, an entry is logged.
- When the **canc-cmd** command (without the **trm** parameter) is entered as a SEAS flow-thru command, an entry is logged. The **canc-cmd:trm=** command is not allowed as a SEAS flow-thru command because the **canc-cmd:trm=** command belongs to the Security Administration Command Class.

For examples of the security log entries, see the **rtrv-seculog** command.

Output

```

canc-cmd
rlghncxa03w 04-07-27 17:00:36 EST EAGLE 31.6.0
canc-cmd
Command entered at terminal #2.

rlghncxa03w 04-07-27 17:00:36 EST EAGLE 31.6.0
Command aborted on terminal 2.
;

```

canc-dlk**Cancel Data Link**

Use this command to remove an TCP/IP data link from service. The state of the link is changed from in service normal (IS-NR) to out of service maintenance disabled (OOS-MT-DSBLD).

Keyword: **canc-dlk**

Related Commands: **act-dlk, dlt-dlk, ent-dlk, rept-stat-dlk, rtrv-dlk, tst-dlk**

Command Class: Link Maintenance

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Example

```
canc-dlk:loc=1308
```

Dependencies

No other action command can be in progress when this command is entered.

The shelf and card must be equipped.

The card location must contain a STPLAN card.

The card location, frame, shelf, or slot must be within the allowed range.

The signaling link must be equipped in the database.

A card location that is valid and defined in the database must be specified.

Notes

None

Output

```

canc-dlk:loc=1308
rlghncxa03w 04-01-27 17:00:36 EST EAGLE 31.3.0
Deactivate Link message sent to card.
Command Completed.
;

```

canc-echo**Cancel Echo**

Use this command to halt the echoing of command responses from the user's terminal to other terminals or printers.

Keyword: `canc-echo`

Related Commands: `act-echo`, `alw-trm`, `chg-trm`, `dact-echo`, `inh-trm`, `rept-stat-trm`, `rmv-trm`, `rst-trm`, `rtrv-trm`

Command Class: Basic

Parameters

:trm= (optional)

The ID number of the terminal for which the echo is being canceled.

Range: 1-16

Default: Cancels all active echoes

Example

```
canc-echo
```

```
canc-echo:trm=7
```

Dependencies

The echo cannot be cancelled to the same terminal from which the **canc-echo** command is entered.

An **act-echo** command must be active at the specified terminal before this command can be entered to cancel the echo.

Notes

Only the echoing of command output responses can be halted by this command. To halt the printing of alarm and network messages, the **chg-trm** command must be used.

Output

```
canc-echo
```

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
canc-echo
Command entered at terminal #6.
Scroll Area Output echo disabled to all terminals.
;
```

```
canc-echo:trm=7
```

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
canc-echo:trm=7
Command entered at terminal #6
Scroll Area Output echo disabled for terminal 7.
;
```

canc-lpo

Cancel Local Processor Outage

Use this command to cancel a processor outage and restore the link to its previous state. LSSUs with status of processor outage are terminated, and the link begins sending MSUs.

NOTE: The signaling link's blocked status is not preserved across a card reboot.

Keyword: `canc-lpo`

Related Commands: `act-lpo`, `blk-slk`, `ublk-slk`

Command Class: Link Maintenance

Parameters

:link= (mandatory)

The signaling link defined on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

Synonym: `port`

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

:loc= (mandatory)

The address of the card containing the signaling link to be unblocked.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

```
canc-lpo:loc=2311:link=b
```

Dependencies

A card location must be specified that is valid and defined in the database.

No other action command can be in progress when this command is entered.

The value specified for the **loc** parameter must refer to one of the following cards, and the referenced card must be equipped:

- E1-ATM card running the ATMITU application
- E1/T1 MIM, E5-E1T1, or HC-MIM card running the SS7ANSI or CCS7ITU application
- E5-ATM or E5-ATM-B card running the ATMANSI or ATMITU application
- E5-ENET or E5-ENET-B card running the IPSG application
- E5-ENET, E5-ENET-B, or SSEDCCM card running the IPLIM or IPLIMI application
- LIM card running the SS7ANSI or CCS7ITU application
- LIM-ATM card running the ATMANSI application

This command cannot be entered for IPLIMx signaling links that have an **ipliml2** parameter setting that is not **m2pa**.

This command is not valid for cards running the SS7IPGW, IPGWI, or IPGHC GPLs.

The card must contain signaling links.

The signaling link must be equipped in the database.

This command is not valid for links belonging to proxy linksets.

An appropriate value must be specified for the **link** parameter when an ATM card is used:

- **a**—E1-ATM card running the ATMITU application or the LIM-ATM card running the ATMANSI application
- **a-a1, b**—E5-ATM or E5-ATM-B card running the ATMANSI or ATMITU application

Notes

The function of this command is the same as the **ublk-slk** command.

Unblocking a signaling link removes a Level 2 failure resulting from a **blk-slk** of an ATM high-speed signaling link.

The *Installation Manual - EAGLE 5 ISS* provides an illustration of card locations.

Output

```
canc-lpo:loc=2311:link=a
```

```
tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
Local processor outage being cleared.
```

```
;
```

In the following example, card location 1113 is not valid:

```
canc-lpo:loc=1113:link=a
```

```
tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
Command Rejected : Location is not valid for command
```

```
;
```

canc-slk**Cancel Signaling Link**

Use this command to change the state of the specified link to OOS-MT-DSBLD (Out-Of-Service Maintenance Disabled).

CAUTION

CAUTION: This command impacts network performance and should be used only during periods of low traffic.

Keyword: `canc-slk`

Related Commands: `act-slk`, `alw-slk`, `blk-slk`, `dact-slk`, `dlt-slk`, `ent-slk`, `inh-slk`, `rept-stat-slk`, `rtrv-slk`, `tst-slk`, `ublk-slk`, `unhb-slk`

Command Class: Link Maintenance

Parameters

:link= (mandatory)

Signaling link defined on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

Synonym: `port`

Range: `a, b, a1-a31, b1-b31`

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: `1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118`

Example

```
canc-slk:loc=1301:link=a
```

Dependencies

A card location must be specified that is valid and defined in the database.

No other action command can be in progress when this command is entered.

The card must contain signaling links.

The signaling link must be equipped in the database.

The card that contains the specified signaling link must be equipped in the specified card location. The card in the specified card location cannot be a TDM card, an MDAL card, an HMUX or HIPR card, or the cards running the OAM application.

An appropriate value must be specified for the **link** parameter when an ATM card is used:

- **a**—E1-ATM card running the ATMITU application or the LIM-ATM card running the ATMANSI application
- **a-a1, b**—E5-ATM or E5-ATM-B card running the ATMANSI or ATMITU application

Notes

Not every card location represents a signaling link. Be sure to address a signaling link in this command.

The *Installation Manual - EAGLE 5 ISS* provides an illustration of card locations.

After the **canc-slk** command is entered, the **rept-stat-slk** command can be entered to verify the cancellation.

Output

```
canc-slk:loc=1301:link=a
rlghncxa03w 05-02-07 11:11:28 EST EAGLE5 33.0.0
Deactivate Link message sent to card
;
```

canc-user

Cancel User

Use this command to end a user session.

Keyword: **canc-user**

Related Commands: **act-user, chg-pid, chg-user, dact-user, dlt-user, ent-user, login, logout, rept-stat-user, rtrv-secu-user, rtrv-user**

Command Class: Basic

Parameters

This command has no parameters.

Example

```
canc-user
```

Dependencies

None

Notes

The **dact-echo** or **logout** commands can be used in place of **canc-user**.

Output

Not applicable.

chg-acg-mic

Change ACG Manually Initiated Control

Use this command to change the values of ACG controls assigned to certain queries. The control can apply to all queries or to specific query services and called party digits. A particular control is selected to be changed by either specifying that it is the **type=all** control or specifying its service and digits.

Keyword: chg-acg-mic

Related Commands: dlt-acg-mic, ent-acg-mic, rept-stat-lnp, rtrv-acg-mic

Command Class: Database Administration

Parameters

:aintvl= (optional)

AIN interval index

Range: 1-15

Default: No change to the current value

:dgts= (optional)

Digits

Range: 000-999, 000000-9999999999

Specify 3 digits or 6-10 digits.

:drtn= (optional)

Duration index. The amount of time that the ACG is in effect. This number is mapped to a time value at the LNP node.

Range: 1-13

Default: No change to the current value

:intvl= (optional)

Interval index. The amount of time between ACGs. This number is mapped to a time value for the LNP node.

Range: 0-15

Default: No change to the current value

:nd= (optional)

New number of digits

Range: 3, 6-10

Default: No change to the current value

:serv= (optional)

Query service

Range: ain, in

:type= (optional)

Type of control

Range: all, sd

Default: sd

Example

To change the type=all MIC to use 3 digits:

```
chg-acg-mic:type=all:nd=3
```

To change the MIC for AIN queries for 919-460-2132 to use an interval index of 15:

```
chg-acg-mic:serv=ain:dgts=9194602132:aintvl=15
```

To change the MIC for IN queries for 919-xxx-xxxx to use a duration index of 9 and an interval index of 5:

```
chg-acg-mic:serv=in:dgts=919:drtn=9:intvl=5
```

Dependencies

If the **type=all** parameter is specified, then the **nd**, **drtn**, **intvl**, or **aintvl** parameter must be specified.

If the **type=all** parameter is specified, then the **serv** and **dgts** parameters cannot be specified.

If the **type=sd** parameter is specified, then the **serv** and **dgts** parameters must be specified.

If the **type=sd** parameter is specified, then the **nd** parameter cannot be specified.

If the **serv=ain** parameter is specified, then the **drtn** or **aintvl** parameter must be specified.

If the **serv=ain** parameter is specified, then the **intvl** parameter cannot be specified.

If the **serv=in** parameter is specified, then the **drtn** or **intvl** parameter must be specified.

If the **serv=in** parameter is specified, then the **aintvl** parameter cannot be specified.

The **dgts** parameter value must be either 3 digits in the range **000-999** or 6-10 digits in the range **000000-9999999999**.

The **nd** parameter value must be **3** or **6-10** to indicate the number of new digits.

The LNP feature must be turned on before this command can be entered.

If the **type=all** parameter is specified, then a MIC with **type=all** must exist.

If the **type=sd** parameter is specified, then a MIC with the same service and digits must exist.

Notes

None

Output

```
chg-acg-mic: type=all: nd=31
  rlgncxa03w 04-01-28 08:50:12 EST EAGLE 31.3.0
  ACG MIC table is (11 of 256) 4% full of type SD
  CHG-ACG-MIC: MASP A - COMPLTD
;
```

chg-acg-noc

Change ACG Node Overload Control

Use this command to change the definition of a node overload level. The definition is comprised of the threshold LNP query rates for node overload levels and the values for the automatic call gappings (ACG) to be sent when at the specified level.

Keyword: **chg-acg-noc**

Related Commands: **dlt-acg-noc, ent-acg-noc, rept-stat-lnp, rtrv-acg-noc**

Command Class: Database Administration

Parameters

:lvl= (mandatory)

Overload level.

Range: **1-10**

:and= (optional)

AIN number of digits. The number of digits in the global title address of an AIN query.

Range: **6, 10**

Default: No change to the current value

:drtn= (optional)

Duration index. The amount of time that the ACG is in effect. This number is mapped to a time value at the LNP node.

Range: **1-13**

Default: No change to the current value

:ind= (optional)

IN number of digits. The number of digits in the global title address of an IN query.

Range: **6, 10**

Default: No change to the current value

:intvl= (optional)

Interval index. The amount of time between ACGs. This number is mapped to a time value for the LNP node.

Range: 0-15

Default: No change to the current value

:qr= (optional)

Query rate. The number of LNP queries, which define a particular overload level, in a 30-second period.

Range: 1-2147483647

Default: No change to the current value

Example

To change level 10's query rate and AIN number of digits:

```
chg-acg-noc:lv1=10:qr=900000:and=6
```

To change level 3's duration and interval indexes:

```
chg-acg-noc:lv1=3:drtn=7:intvl=3
```

Dependencies

At least one optional parameter must be specified.

The **and** parameter value must be either **6** or **10**.

The specified overload level must be defined.

The LNP feature must be turned on before this command can be entered.

The **ind** parameter value must be either **6** or **10**.

Notes

None

Output

```
chg-acg-noc:lv1=10:qr=900000:and=6
rlghncxa03w 03-02-28 08:50:12 EST EAGLE 28.1.0
CHG-ACG-NOC: MASP A - COMPLTD
;
```

chg-ainpopts

Change AINP Options Command

Use this command to provision AINPQ-specific data. This command updates the AINPOPTS table.

Keyword: chg-ainpopts

Related Commands: rtrv-ainpopts

Command Class: Database Administration

Parameters

NOTE: The nature of address indicator parameters (rnaiv or rnai) and numbering plan parameters (rnp or rnpv) can be specified using a mnemonic or an explicit value. The mnemonic and explicit values cannot be specified at the same time for the same parameter.

:defrn= (optional)

Default routing number. This parameter specifies a default routing number that is used for own-network subscribers.

Range: 1-15 digits, none

Default: No change to the current value
System
Default: none

:dialnai= (optional)

Digits dialed nature of address indicator.

Range: **0, 1**
0 — National
1 — International

Default: No change to the current value
System
Default: **0**

:dialpfx= (optional)

Dialed party number prefix.

Range: 1-15 digits
Valid digits are **0-9, A-F, a-f**.

Default: No change to the current value
System
Default: none

:dltpfx= (optional)

Delete prefix. This parameter specifies whether to delete the **dialpfx**.

Range: **yes, no**
Default: No change to the current value
System
Default: **no**

:ndialpfx= (optional)

New dialed party number prefix.

Range: 1-15 digits, **none**
Valid digits are **0-9, a-f, A-F**.

System
Default: none

:nec= (optional)

National Escape Code.

Range: 1-5 digits, **none**
Valid digits are **0-9, A-F, a-f**.

Default: No change to the current value
System
Default: **none**

:rfmt= (optional)

Routing address format. This parameter specifies the routing address format that is supported in the AINPQ "Return Result" response messages.

Range: **rndn, rn, ccrndn, rnnecd, homerndn, rnasd, asdrn, rnasddn, asdrndn, cernasddn, asdrnecd, ccasdrndn, rnasdcedn, rnasdnecd, asdrnnecdn, rngrn, grnrn, rngrndn, grnrndn, cerngrndn, ccgrnrndn, grnrnecd, rngrnecd, rngrnnecd, grnrnnecd, grn, grndn, ccgrndn**
rndn — RN + [DIALPFX] + DN
rn — Routing Number
ccrndn — [DIALPFX] + CC + RN + DN
rnnecd — RN + [DIALPFX] + NEC + DN
homerndn — Home Routing Number
rnasd — RN + ASD

asdrn— ASD + RN
rnasddn— RN + ASD + [DIALPFX] + DN
asdrndn— ASD + RN + [DIALPFX] + DN
ccrnasddn— [DIALPFX] + CC + RN + ASD + DN
asdrnccdn— ASD + RN + [DIALPFX] + CC + DN
ccasdrndn— [DIALPFX] + CC + ASD + RN + DN
rnasdccdn— RN + ASD + [DIALPFX] + CC + DN
rnasdnecdn— RN + ASD + [DIALPFX] + NEC + DN
asdrnnecdn— ASD + RN + [DIALPFX] + NEC + DN
rngrn— RN + GRN
grnrn— GRN + RN
rngrndn— RN + GRN + [DIALPFX] + DN
grnrndn— GRN + RN + [DIALPFX] + DN
ccrngrndn— [DIALPFX] + CC + RN + GRN + DN
ccgrnrndn— [DIALPFX] + CC + GRN + RN + DN
grnrnccdn— GRN + RN + [DIALPFX] + CC + DN
rngrnccdn— RN + GRN + [DIALPFX] + CC + DN
rngrnnecdn— RN + GRN + [DIALPFX] + NEC + DN
grnrnnecdn— GRN + RN + [DIALPFX] + NEC + DN
grn— GRN
grndn— GRN + [DIALPFX] + DN
ccgrndn— [DIALPFX] + CC + GRN + DN

Default: No change to the current value

System

Default: **rndn**

:rnaiv= (optional)

Routing nature of address indicator

Range: **natl, intl, frmsg**

natl— National significant number

intl— International number

frmsg— NAI from the incoming message

Default: No change to the current value

System

Default: **frmsg**

:rnaiv= (optional)

Routing nature of address indicator value

Range: **0, 1**

0— National

1— International

Default: No change to the current value

System

Default: none

:rnp= (optional)

Routing numbering plan

Range: **unknown, e164, e212, priv**

unknown— IS41 Numbering Plan Unknown

e164— IS41 Telephony Number

e212— IS41 Land Mobile Number

priv— IS41 Private Number

Default: No change to the current value

System

Default: **e164**

:rnpv= (optional)

Routing numbering plan value

Range: 0-15**Default:** No change to the current value**System****Default:** 2**:snai=** (optional)

Service Nature of Address indicator.

Range: sub, natl, intl, unknown, none**sub** — Subscriber Number**natl** — National Significant Number**intl** — International Number**unknown** — Unknown NAI value**none** — NAI value none**Default:** No change to the current value**System****Default:** none**:sporttype=** (optional)

Service Portability type. This parameter specifies whether Service Portability is performed for the associated feature.

NOTE: If Service Portability is performed, then the Service Portability prefix (RTDB 'GRN'entity id) is applied.

The S-Port feature must be enabled before this parameter can be specified. The S-Port feature must be turned on before any change to the parameter will impact the associated feature.

Range: gsm, is41, all, none**gsm, none** — apply Service Portability prefix for own-network GSM subscribers**is41, none** — apply Service Portability prefix for own-network IS41 subscribers**all, none** — apply Service Portability prefix for all own-network (IS41 and GSM) subscribers**none** — Service Portability is not performed for the feature.**Default:** No change to the current value**System****Default:** none**:sprestype=** (optional)

SP response type. This parameter specifies the type of message that is sent by the system if an NPREQ message is received, the DN digits match, and the HLR ID is present.

Range: rrwodgts, rrwdgts**rrwdgts** — The system sends a "Return Results with Digits" message.**rrwodgts** — The system sends a "Return Results without Digits" message.**Default:** No change to the current value**System****Default:** rrwdgts**Example****chg-ainpopts:rfmt=rn:rnp=e164:rnai=intl:dialpfx=fac:dltpfx=yes****chg-****ainpopts:rfmt=rndn:rnp=e212:rnai=intl:dialpfx=fac:dltpfx=no :dialnai=1:snai=natl**

```

chg-
ainpopts : rfmt=rngrnccdn : rnp=e164 : rna=intl : dialpfx=fac : dltpfx=yes
chg-ainpopts : sprestype=rrwdgts : rfmt=rnnecdn : nec=abcd1

chg-
ainpopts : rfmt=asdrnccdn : rnp=e164 : rna=intl : dialpfx=fac : dltpfx=yes

```

Dependencies

At least one optional parameter must be specified.

The **rnp** and **rnpv** parameters cannot be specified together in the command.

The **rnai** and **rnaiv** parameters cannot be specified together in the command.

If the **ndialpfx** or **dltpfx** parameter is specified, then the **dialpfx** parameter must be specified.

The **dialpfx=none** parameter cannot be specified.

If the **ndialpfx=none** parameter is specified, then the **dltpfx** parameter cannot be specified.

If the **ndialpfx** and **dialpfx** parameters are specified, then the value specified for the **dialpfx** parameter must already exist in the AINPOPTS table.

The value specified for the **ndialpfx** parameter cannot already exist in the AINPOPTS table.

A maximum of 2 Dialed Party Number Nature of Address values are allowed.

The **dialnai** and **snai** parameters must be specified together in the command.

If the **snai=none** parameter is specified, then the value specified for the **dialnai** parameter must already exist in the AINPOPTS table.

A maximum of 40 Dialed Party Number Prefix values can be provisioned.

If the **nec=none** parameter is specified, then values of **asdrnecdn**, **rnsdnecdn**, **rnnecdn**, **rngrnecdn**, and **grnrnecdn** cannot be specified for the **rfmt** parameter.

The S-Port feature must be enabled before the **sporttype** parameter can be specified.

The AINPQ feature must be enabled before this command can be entered.

Output

```

chg-ainpopts : rfmt=rnsd : nec=0
tekelecstp 09-06-03 15:15:44 EST EAGLE 41.1.0
CHG-AINPOPTS: MASP A - COMPLTD
;

```

chg-aiqopts

Change AIQ Options

Use this command to provision AIQ specific data. This command updates the AIQOPTS table.

Keyword: chg-aiqopts

Related Commands: rtrv-aiqopts

Command Class: Database Administration

Parameters

:digmaxlen= (optional)

Maximum Length of Digit String. This parameter specifies the maximum length of a digit string that is considered valid in the *Digits (Dialed)* field of an AnalyzedInformation query.

Range: 1-32

Default: No change to the current value

System
Default: 32

:digminlen= (optional)

Minimum Length of Digit String. This parameter specifies the minimum length of a digit string that is considered valid in the *Digits (Dialed)* field of an AnalyzedInformation query.

Range: 1-32
Default: No change to the current value
System
Default: 1

:pfx= (optional)

Digit String. This parameter specifies the digit string that is associated with a Trigger Type (value of **trigtype** parameter). The value specified for the **pfx** parameter is encoded in the response message.

Range: 1-21 digits, **none**
none—deletes the associated Trigger Type value
Default: No change to the current value
System
Default: none

:resfmt= (optional)

Response format. This parameter specifies the format of outgoing routing digits in the AnalyzedInformation response message.

Range: **pfxdn, pfx**
pfxdn— the value specified for the **pfx** parameter + the incoming dialed digits
pfx— the value specified for the **pfx** parameter
Default: No change to the current value
System
Default: **pfxdn**

:respar= (optional)

Response Digits. This parameter specifies the TCAP field that is used to encode the AnalyzedInformation response message.

Range: **rtdigits, digits**
rtdigits— TCAP *RoutingDigits* field
digits— TCAP *Digits (Dialed)* field
Default: No change to the current value
System
Default: **rtdigits**

:tcaperr= (optional)

TCAP Error Code. This parameter specifies the TCAP error code that is used in a Return Error response.

Range: 129-255

- 129—UnrecognizedMIN
- 130—UnrecognizedESN
- 131—MIN/HLR Mismatch
- 132—OperationSequenceProblem
- 133—ResourceShortage
- 134—OperationNotSupported

- 135—TrunkUnavailable
- 136—ParameterError
- 137—SystemFailure
- 138—UnrecognizedParameterValue
- 139—FeatureInactive
- 140—MissingParameter
- 141-239—Reserved
- 240-255—Reserved for Protocol Extension

Default: No change to the current value

System

Default: 138

:trigtype= (optional)

TriggerType Value. This parameter identifies an individual trigger and is used to specify an association between a trigger and a corresponding address digit string (value of **px** parameter).

A maximum of 20 **trigtype - px** entries are supported. The **px** digit string corresponding to the specified Trigger Type present in the Incoming AnalyzedInfo Query is encoded in the Response message.

Range: 0-255

Table 5-1 lists the mnemonic for each TRIGTYPE decimal value.

Example

The following command specifies the provisioning of a Trigger Type – Prefix string pair.

```
chg-aiqopts:trigtype=2:px=65432
```

The following command deletes an already provisioned Trigger Type.

```
chg-aiqopts:trigtype=2:px=none
```

The following command specifies digminlen-digmaxlen range (5-7) .

```
chg-aiqopts:digminlen=5:digmaxlen=7
```

The following command provisions the response parameter and response format.

```
chg-aiqopts:respar=rtdigits:resfmt=px
```

Dependencies

The ANSI41 AIQ feature must be enabled before this command can be entered.

The **px** and **trigtype** parameters must be specified together in the command.

The value specified for the **digminlen** parameter must be less than or equal to the value specified for the **digmaxlen** parameter.

A maximum of 20 **trigtype - px** entries can be specified in the AIQOPTS table.

A **px - trigtype** pair must be specified with a supported value for the **trigtype** parameter before the **px=none** parameter can be specified.

Notes

If the same value is specified for the **digminlen** and **digmaxlen** parameters, then only MSUs with dialed digits of the specified length are accepted for processing.

The value of the *Digits (Dialed)* length must be between the values specified for the **digminlen** and **digmaxlen** parameters.

A maximum of 20 **px - trigtype** pairs can be specified.

Table 5-1 lists the decimal value and mnemonic for each TRIGTYPE parameter value.

Table 5-1. TRIGTYPE Parameter Values

Decimal Value	Mnemonic	Decimal Value	Mnemonic
0	Unspecified.	24	Local_Call.
1	All_Calls.	25	Local_Toll_Call.
2	Double_Introducing_Star.	26	Non-Local_Toll_Call
3	Single_Introducing_Star.	27	World_Zone_Call.
4	Reserved [for Home_System_Feature_Code]	28	International_Call.
5	Double_Introducing_Pound.	29	Unrecognized_Number.
6	Sungle_Introducing_Pound.	30	Prior_Agreement.
7	Revertive_Call.	31	Specific_called_Party_Digit_String.
8	0_Digit.	32	Mobile_Termination.
9	1_Digit.	33	Advanced_Termination.
10	2_Digit.	34	Location.
11	3_Digit.	35-63	Reserved. Treat a reserved value the same as value 0, Unspecified.
12	4_Digit.	64	Terminating_Resource_Available.
13	5_Digit.	65	T_Busy.
14	6_Digit.	66	T_No_Answer.
15	7_Digit.	67	T_No_Page_Response.
16	8_Digit.	68	T_Unroutable.
17	9_Digit.	69-219	Reserved. Treat a reserved value the same as value 0, Unspecified.
18	10_Digit.	220	Reserved for TDP-R DP value.
19	11_Digit.	221	Reserved for TDP-N DP value.
20	12_Digit.	222	Reserved for EDP-R DP value.
21	13_Digit.	223	Reserved for EDP-N DP value.

Table 5-1. TRIGTYPE Parameter Values

Decimal Value	Mnemonic	Decimal Value	Mnemonic
22	14_Digit.	224-255	Reserved for TIA-41 protocol extension. If unknown, treat the same as value 0, Unspecified.
23	15_Digit.

chg-appl-rtkey

Change Static Routing Key Table Entries

Use this command to change static entries in the Routing Key table. Only one attribute can be changed at a time.

Keyword: chg-appl-rtkey

Related Commands: dlt-appl-rtkey, ent-appl-rtkey, rtrv-appl-rtkey

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

NOTE: See Table A-4 for valid CIC values for specified SI and MSU types.

:cice= (optional)

The end range of circuit identification codes assigned to the routing key. The **cice** and **cics** parameters identify the routing key to be changed.

Range: 0-4294967295

:cics= (optional)

The start range of circuit identification codes assigned to the routing key. The **cics** and **cice** parameters identify the routing key to be changed.

Range: 0-4294967295

:dpc= (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: dpca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Destination point code.

:dpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:ncice= (optional)

The new end range of circuit identification codes assigned to the routing key. Specify the **ncice** and/or **ncics** parameter to change the range of the circuit identification codes assigned to the routing key.

Range: **0-4294967295**

:ncics= (optional)

The new start range of circuit identification codes assigned to the routing key. Specify the **ncics** and/or **ncice** parameter to change the range of the circuit identification codes assigned to the routing key.

Range: **0-4294967295**

:nrcontext= (optional)

This parameter modifies the routing context value assigned to this routing key.

Routing context is mandatory for routing keys associated with SUA Application Servers. Routing context is optional for routing keys associated with M3UA Application Servers.

An AS can be associated with only 1 routing key with routing context. An AS can be associated with multiple routing keys that do not contain routing context. An AS cannot be simultaneously assigned to a routing key with routing contexts and to routing keys without routing contexts.

Range: 0-4294967295

:opc= (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: opca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.

The point code **000-000-000** is not a valid point code.

:opc/opca/opci/open/open24= (optional)

Originating point code. Valid only if **si=4, 5, or 13** and required if **si=4, 5, or 13**.

:opci= (optional)

ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:opcn= (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:opcn24= (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:rcontext= (optional)

This parameter specifies a routing key by its routing context when a routing key needs to be changed as an alternative to entering the **dpc/si/ssn/opc/cics/cice/type** parameters.

Split operations are invalid for routing keys with routing context.

Range: **0-4294967295**

:si= (optional)

The service indicator.

Range: **0-15**

0-15 or equivalent text values:

Number = Text—Description

0 = snm—Signaling network management messages

1 = regtest—Signaling network testing and maintenance regular

2 = spltest—Signaling network testing and maintenance special

3 = sccp—SCCP

4 = tup—Telephone user part

5 = isup—ISDN user part

13 = qbicc

See Table A-4 and Table 5-2 for valid **si** values in combination with other parameters.

:split= (optional)

The CIC value where the routing key with the specified CICS and CICE range will be split. The specified routing key is split into two entries with adjacent CIC ranges. The existing routing key retains the range of CICs that is lower than the **split** value. The value of **split** minus 1 is used as the end range for this entry. The range of CICs assigned to the original entry is the values of **cics** to **split** minus 1.

A new routing key entry is created with the high end of the original range. The **split** value is used as the start of the CIC range for this entry. The range of CICs assigned to the new entry is the values of **split** to **cice**.

This parameter is valid only if **si=4, 5, or 13** and is not valid with **ncics** or **ncice**. See Table A-4 and Table 5-2.

Range: **0-16363**

:ssn= (optional)

Subsystem number.

Range: **0-255**

:type= (optional)

Type of routing key.

Range: **full, partial, default**

Default: **full**

Example

```

chg-appl-
rtkey:dpc=123-230-245:si=5:opc=123-230-244:cics=1:cice=100:split=
50
chg-appl-
rtkey:dpc=123-230-245:si=5:opc=123-230-244:cics=1:cice=50:ncice=1
00
chg-appl-
rtkey:dpcn24=10-100-10:si=5:opc=10-100-11:cics=1:cice=100:ncic
e=200
chg-appl-rtkey:dpc=8-8-8:si=3:ssn=5:rcontext=500
chg-appl-
rtkey:dpci=s-3-11-1:si=5:opci=s-4-11-1:cics=1:cice=1000:ncice=500
chg-appl-rtkey:rcontext=5:ncice=100
chg-appl-rtkey:rcontext=1:nrcontext=2

```

Dependencies

Optional parameters that must be specified with the **chg-appl-rtkey** command depend on the type of routing key being changed. See Table 5-2 for valid parameter combinations.

For SS7IPGW and IPGWI applications running on SSEDCEM, E5-ENET, or E5-ENET-B cards, there is a limit of 2500 routing keys in the system. The **srkq** parameter (see the **chg-sg-opts** command) limits the maximum number of static routing keys that can be provisioned with the **ent-appl-rtkey** command.

The subsystem number is mandatory and valid only when the **si=3** (or **scpp**) parameter is specified; if the **si** parameter does not equal **3** (or **scpp**), the **ssn** parameter cannot be specified.

The value entered for the starting circuit identification code (**cics**) must be less than or equal to the value entered for the ending circuit identification code (**cice**).

The value entered for the new starting circuit identification code (**ncics**) must be less than or equal to the value entered for the new ending circuit identification code (**ncice**).

A circuit identification code range (**cics** to **cice**) cannot be specified that overlaps an existing routing key.

When **si=4**, **5**, or **13** (or **tup**, **isup**, or **qbicc**), the **opc**, **cics**, and **cice** parameters are required. The **opc**, **cics**, and **cice** parameters can be specified only if **si=4**, **5**, or **13**.

The value entered for the circuit identification code split range (**split**) must be greater than the value entered for the starting circuit identification code (**cics**) and less than or equal to the value entered for the ending circuit identification code (**cice**).

The value entered for the new starting circuit identification code (**ncics**) must be less than or equal to the value entered for the ending circuit identification code (**cice**) when the new ending circuit identification code (**ncice**) is not specified.

The value entered for the new ending circuit identification code (**ncice**) must be greater than or equal to the value entered for the starting circuit identification code (**cics**) when the new starting circuit identification code (**ncics**) is not specified.

The **split**, **ncics**, and **ncice** parameters are not allowed with the **si** parameter unless the **si=4**, **5**, or **13** (or **tup**, **isup**, or **qbicc**) parameter is specified.

A DPC/SI routing key must be specified when the DPC is ANSI and the **si=4** parameter is specified (TUP is used only in an ITU network).

Table A-4 shows valid CIC values for SI types 4, 5, and 13.

Partial point codes are not allowed; no asterisks can be specified in the point codes in the command.

Mixed point code types are not allowed; **opc** and **dpc** types must match.

When the **type=partial** or **type=default** parameters are specified, the **split** and **resize** parameters are not supported.

When the **type=full** parameter is specified, the **dpc** and **si** parameters must be specified.

The following types of partial routing keys are supported:

- DPC-SI-OPC (ignore CIC) can be used as a partial match key for CIC- based traffic.
- DPC-SI (ignore all other fields) can be used as a partial match key for CIC- based traffic or SCCP traffic.
- DPC only (ignore all other fields) can be used as a partial match for any type of traffic.
- SI only (ignore all other fields) can be used as a partial match for any type of traffic.

If the **rcontext** parameter is specified, then the **split**, **ncics** and **ncice** parameters cannot be specified.

The **rcontext** parameter must be specified for routing keys that are associated with SUA Application Servers.

The specified **rcontext** parameter value must already exist in the database.

If specified, the service indicator parameter must be **si=3** for routing keys that are associated with SUA Application Servers.

An AS cannot be simultaneously assigned to a routing key with routing contexts and routing keys without routing context. To assign an M3UA or SUA association to multiple routing keys with routing context, the M3UA/SUA association must be assigned to more than one AS, and each AS must be assigned to a routing key with routing context.

The AS name and parameters specified for a routing key must use an address format that is valid for the adapter type assigned to the AS.

Table 5-2. Valid Parameter Combinations for **chg-appl-rtkey** Routing Key Types

Action	dpc	si	ssn	opc	cics	cice	ncics	ncice	split	type
Split CIC Range	X	X		X	X	X			X	full
Re-size CIC Range	X	X		X	X	X	X	X		full
Socket Name Override (SI=ISUP or 5)	X	X		X	X	X				full
Socket Name Override (SI = SCCP or 3)	X	X	X							full
Socket Name Override (SI = not 3, 4, 5, or 13)	X	X								full
Socket Name Override (SI = 4, 5, or 13)	X	X		X						partial
Socket Name Override (SI = 3, 4, 5 or 13)	X	X								partial
Socket Name Override SI-only key		X								partial

Table 5-2. Valid Parameter Combinations for **chg-appl-rtkey** Routing Key Types

Action	dpc	si	ssn	opc	cics	cice	ncics	ncice	split	type
Socket Name Override DPC-only key	X									partial
Socket Name Override Default key										default

The value of the **nrcontext** parameter cannot be changed for a routing key if the **rcontext** parameter has not been configured for that routing key.

The attributes that are required to change a routing key must be specified in the command.

Notes

A routing key entry associates a routing key with a socket name or Application Server (AS) name.

The parameters **dpc**, **si**, **ssn**, **opc**, **cics**, and **cice** are used to identify the routing key to be changed.

The parameters **split**, **ncics**, and **ncice** are used to specify new values for the routing key.

The **opc**, **cics**, and **cice** parameters are not required for partial routing keys.

The **cics**, **cice**, **ncice**, **ncice**, and **split** parameters are valid and required when **si=4** and ITU DPCs (**dpci**, **dpcn**) are specified. These parameters are not valid when an ANSI DPC (**dpc**, **dpca**) is specified and **si=4**.

The following changes can be made for routing keys. Only one of these changes is allowed per command.

- A routing key can be split into two entries with adjacent CIC ranges. The resulting entries retain the socket associations of the original entry.
- The range of CICs assigned to a routing key can be changed as long as it does not overlap another routing key. The new entry retains the socket associations of the original entry.

Group codes are required for ITU-N point codes (DPCN/OPCN) when the Duplicate Point Code feature is turned on.

Routing context is a routing key parameter that uniquely identifies routing keys. Routing context is mandatory for routing keys associated with SUA Application Servers and optional for routing keys associated with M3UA Application Servers.

An AS cannot be simultaneously assigned to a routing key with routing contexts and routing keys without routing contexts.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Output

```
chg-appl-rtkey:dpc=123-230-245:si=3:ssn=250:nsname=socket5

;
```

chg-as

Change Application Server

Use this command to change the characteristics of an existing Application Server (AS).

Keyword: chg-as

Related Commands: dlt-as, ent-as, rept-stat-as, rtrv-as

Command Class: Database Administration

Parameters

:asname= (mandatory)

Application Server name.

Range: ayyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter.

:mode= (optional)

Traffic mode assigned to the AS.

Range: loadshare, override

Default: No change to the current value

System

Default: loadshare

:tr= (optional)

Recovery timer value for the AS in milliseconds.

Range: 10 - 2000

Default: No change to the current value

System

Default: 200

Example

```
chg-as : asname=asx : mode=override
```

Dependencies

The value specified for the **asname** parameter must already exist in the AS table.

Association connection parameters must be unique.

The connection state for all associations assigned to the AS must be **open=no** before the **mode** parameter can be changed.

Notes

By default, the AS recovery timer value is set to 200 ms when an AS is entered. This value can be changed at any time using the **chg-as** command. The new timer value will be used the next time the AS enters the AS-Pending state.

Output

```
chg-as : asname=asx : mode=override
```

```
rlghncxa03w 04-01-17 15:35:05 EST EAGLE 31.3.0
CHG-AS: MASP A - COMPLTD
```

```
;
```

chg-assoc

Change Association

Use this command to configure existing SCTP associations in the IPASOCK table.

Keyword: chg-assoc

Related Commands: dlt-assoc, ent-assoc, rept-stat-assoc, rtrv-assoc

Command Class: Database Administration

Parameters**:aname=** (mandatory)

Name assigned to this association (in IPAPSOCK table).

Range: *aaaaaaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter.

:adapter= (optional)

Adapter layer for the association.

Range: **m3ua, sua, m2pa****Default:** No change to the current value**System****Default:** **m3ua****:alhost=** (optional)

Alternate local host name. This parameter configures the SCTP association as a multi-homed endpoint.

Range: *////////////////////////////////////*, **none**

Any string of characters beginning with a letter and comprising up to 60 characters in length

Valid characters are **a-z, A-Z, 0-9, -** (dash), **.** (period)**none**—The alhost is not configured; the SCTP association is configured as a uni-homed endpoint.**:alw=** (optional)

The parameter specifies whether the connection manager should allow or disallow the association to carry SS7 traffic.

Range: **yes, no****yes**— The connection manager is to allow the association to carry SS7 traffic.**no**— The connection manager is to prohibit the association from carrying SS7 traffic.**Default:** No change to the current value**System****Default:** **no****:bufsize=** (optional)

Association buffer size in Kilobytes.

Range: **8-400****:cwmn=** (optional)

Minimum congestion window. This parameter specifies the minimum and initial sizes, in bytes, of the association's congestion window.

Range: **1500-409600****Default:** No change to the current value**System****Default:** **3000****:istrms=** (optional)

SCTP Inbound Stream Value. A 16-bit unsigned integer that defines the number of streams the sender allows the peer end to create in this association.

Range: **1-2****:lhost=** (optional)

Local host name. This parameter specifies the local host name as defined in the IP Host table.

Range: `////////////////////////////////////`
 Any string of characters beginning with a letter and comprising up to 60 characters in length.
 Valid characters are **0-9, a-z, A-Z, - (dash), . (period)**.
Default: No change to the current value

:link= (optional)
 Signaling link for the association.

Synonym: port
Range: **a, b, a1-a31, b1-b31**
 Not all card types support all **link** parameter values.
 See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling links.
Default: No change to the current value

:lport= (optional)
 Local port. This parameter specifies the SCTP port number for the local host.

Range: **1024-65535**
Default: No change to the current value

:m2patset= (optional)
 M2PA timer set assigned to this association.

Range: **1-20**
Default: **1**

:open= (optional)
 Connection state (open or closed) that the connection manager is to put the association in when the socket is operational.

The **chg-assoc** command allows initiation of SCTP graceful shutdown on a per association basis for IPSG M3UA associations. The **chg-assoc:open=no** command aborts the association unless graceful shutdown is provisioned (see the **chg-uaps** command). If provisioned, then SCTP graceful shutdown for an association occurs after execution of **chg-assoc:open=no**.

Range: **yes, no**
yes— The connection manager is to open the association if the association is operational.
no— The connection manager will not open the association.

Default: No change to the current value

System
Default: **no**

:ostrms= (optional)
 SCTP Outbound Stream Value. This parameter specifies the 16-bit unsigned integer that defines the number of streams the sender wants to create in this association.

Range: **1-2**

:rhost= (optional)
 Remote host. This parameter specifies the name of the remote host as defined in the IP Host table.

Range: `////////////////////////////////////`
 Any string of characters beginning with a letter and comprising up to 60 characters in length.
 Valid characters are **a-z, A-Z, 0-9, - (dash), . (period)**

Default: No change to the current value

:rhosttype= (optional)

Remote host type. This parameter specifies whether the remote host is a primary or alternate remote address.

NOTE: The alternate remote address is used for multi-homed remote hosts.

Range: **primary, alternate**
 primary — primary remote address
 alternate — alternate remote address

Default: No change to the current value

System

Default: **primary**

:rhostval= (optional)

Remote host validation. This parameter specifies the validation mode for the association when an SCTP INIT/INIT-ACK message is received.

Range: **relaxed, match**
 relaxed — accept the message if the IP address for the primary or alternate remote host matches the IP address, source IP address, or host name in the message
 match — accept the message if the message contains the primary remote host value and the alternate remote host value (if the alternate remote host is provisioned). If the alternate remote host is not provisioned, then accept the message if the message contains the primary remote host value. Reject the message if it contains any IP address other than that of the primary or alternate remote host.

The rules determining the use of the **relaxed** and **match** modes depend on multiple conditions, including whether an alternate remote host is provisioned. Refer to the Table 5-4 for validation rules that are used to establish an association for the **relaxed** and **match** modes.

Default: No change to the current value

System

Default: **relaxed**

:rmax= (optional)

Maximum retransmission timeout. This parameter specifies the maximum value of the calculated retransmission timeout in milliseconds.

Range: **10-1000**

Default: No change to the current value

System

Default: **800**

:rmin= (optional)

Minimum retransmission timeout. This parameter specifies the minimum value of the calculated retransmission timeout in milliseconds.

Range: **10-1000**

Default: No change to the current value

System

Default: **120**

:rmode= (optional)

Retransmission mode. This parameter specifies the retransmission policy used when packet loss is detected.

Range: **lin, rfc**

lin — The Tekelec Linear Retransmission Policy where each retransmission timeout value is the same as the initial transmission timeout, and only the slow start algorithm is used for congestion control.

rfc— Standard RFC 2960 algorithm in the retransmission delay doubles after each retransmission. The RFC 2960 standard for congestion control is also used.

Default: No change to the current value

System

Default: **lin**

:rport= (optional)

Remote port. This parameter specifies the SCTP port number for the remote host.

Range: **1024-65535**

Default: No change to the current value

:rtimes= (optional)

Maximum retransmission retries. This parameter specifies the number of times a data retransmission will occur before closing the association.

Range: **1-12**

Default: No change to the current value

System

Default: **10**

:rtxthr= (optional)

Retransmission threshold. This parameter specifies the value of the retransmission threshold to tune the IP Connection Excess Retransmits alarm.

Range: **0-65535**

Default: **0**

:uaps= (optional)

User adapter parameter set. This parameter specifies the set used by the M3UA, SUA or M2PA associations for various timer and parameter values including False IP Connection Congestion Timer, UA Heartbeat Period Timer, UA Heartbeat Received Timer, ASP SNM options, ASP/AS Notifications, UA Serviceability options, and Payload Protocol Indicator byte order option.

Range: **1-10**

:ver= (optional)

Version. This parameter specifies the M2PA version supported by the association.

NOTE: The M2PA version is valid only for associations with the adapter=m2pa parameter specified.

Range: **d6, rfc**

Example

```
chg-
assoc:aname=a1:lhost=gw105.nc.tekelec.com:lport=1030:rhost=gw100.
nc.tekelec.com:rport=1030:open=yes:alw=yes:uaps=10

chg-assoc:aname=m3ua03:rtxthr=65535

chg-
assoc:aname=a1:lhost=tek1.com:lport=1030:rport=1030:rhost=tek2.co
m:rhostval=match:rhosttype=primary

chg-
assoc:aname=a1:rhost=tek.com:rhostval=relaxed:rhosttype=alternate
```

Dependencies

At least one optional parameter must be specified.

The value specified for the **aname** parameter must already exist in the IPAPSOCK table.

An association's connection parameters (**lhost**, **rhost**, **lport**, **rport**) must be unique.

The connection state must be **open=no** to change **lhost**, **rhost**, **lport**, **rport**, **port**, **alhost**, **adapter**, **m2patset**, **istrms**, **ostrms**, **rmode**, **rmin**, **rmax**, **rtimes**, **cwmin**, and **bufsize** parameters.

The **lhost**, **lport**, **rhost**, and **rport** parameters must be specified before the **open=yes** parameter can be specified. The **aname** parameter and at least one other optional parameter must be specified before the **open=no** parameter can be specified.

The value of the **uaps** parameter can be changed for an association if the **open=yes** parameter is specified.

The hostnames specified in the **lhost** and **alhost** parameters must refer to different IP addresses.

The hostnames specified in the **lhost** and **alhost** parameters must refer to IP addresses on the same IP card.

An association with an SUA or M3UA adapter cannot be specified as a local host on a card running the IPLIM or IPLIMI application. An association with an M2PA adapter cannot be specified as a local host on a card running the SS7IPGW or IPGWI application. An association with an SUA adapter cannot be specified as the local host on a card running the IPST application.

The local host must have a signaling link assigned to its associated signaling link port before the **open=yes** parameter can be specified.

An association's **lhost** and **alhost** cannot be assigned to a card's Ethernet interface B.

The adapter layer cannot be changed for an association that is already associated with an Application Server (AS).

Before the local host can be changed, the new local host must have a signaling link assigned to its associated signaling link port.

The following links are valid for the specified card type and application:

- Links A - A3 and B - B3 can be specified for an SSEDCEM card running the IPLIM or IPLIMI application.
- Links A-A7 and B - B7 can be specified for an E5-ENET or E5-ENET-B card running the IPLIM or IPLIMI application.

The card location for the card associated with the **lhost** and **alhost** must exist in the IP Link table.

The allowed maximum is 1 association per signaling link on IPLIMx cards.

A maximum of 50 connections (association-to-AS assignments) can be specified per local host on IPGWx cards.

A maximum of 4000 connections (association-to-AS assignments + sockets) are allowed per system.

Table 5-3 shows the maximum number of associations and links for SSEDCEM, E5-ENET, and E5-ENET-B cards.

Table 5-3. Maximum IP Associations and Links

GPL	Card	Max # of Associations	Max # of Links
IPLIMx	SSEDCEM	8	8
	E5-ENET/E5-ENET-B	16	16
IPGWx	SSEDCEM	50	1
	E5-ENET/E5-ENET-B	50	1
IPSG	E5-ENET/E5-ENET-B	32	32

The **rmin** parameter value must be less than or equal to the **rmax** parameter value.

The **cwmin** parameter value must be less than or equal to the **bufsize** parameter value.

To assign an association on an IPLIMx card for a local host, the association must have an adapter parameter value that is the same as the **ipliml2** setting of its assigned signaling link. An association having an adapter value of **m2pa** must be assigned to an IPLIM signaling link having an **ipliml2** value of **m2pa**.

If the **m2patset** parameter is specified, the **adapter=m2pa** parameter must be specified.

The trade ratio states the quantity of associations to sockets that may be provisioned on a certain card, as follows:

Trade Ratio = a:s

Where: a=associations and s=sockets

The requested buffer size increase cannot exceed available buffer space on the card. Use the **rtrv-assoc** command with the **aname**, **lhost**, or **alhost** parameter to display used and total buffer space on the card.

The **ver** parameter can only be specified if the **adapter=m2pa** parameter is specified.

If the value specified for the **lhost** parameter indicates an IPSPG card, then the **link** parameter cannot be specified.

If an IPSPG card is being used, and if the association is referenced by a signaling link, then new values cannot be specified for the **lhost** or **adapter** parameters.

An IPSPG card can contain a maximum of 32 associations.

If the value specified for the **aname** parameter refers to an M3UA association on an IPSPG card, then the **alw** parameter cannot be specified.

The value specified for the **lhost** parameter cannot change the local host for the association from an IPLIMx or IPGWx card to an IPSPG card or from an IPSPG card to an IPLIMx or IPGWx card.

The **rhosttype=primary** parameter must be specified before the **rhosttype=alternate** parameter can be specified.

If the **rhosttype** parameter is specified, then the **rhost** parameter must be specified.

The value specified for the alternate remote host cannot be the same as the value specified for the **lhost**, **alhost**, or **rhost** parameter in the same association.

The value specified for the **rhost** parameter cannot be the same as the value specified for the alternate remote host or for the **lhost** or **alhost** parameter in the same association.

The host name specified by the **lhost** parameter must exist in the IP Host table and must be provisioned as local to this EAGLE 5 ISS. The value specified for the **host** parameter must begin with an alphabetic character and can contain **a..z**, **A..Z**, **0..9**, - (hyphen), or . (period). If the host name contains a hyphen, then the host name must be enclosed within quotation marks.

Notes

The command that is entered cannot exceed a total of 150 characters in length.

The IPAPSOCK table is used to associate the Local Host/Local Port to a Remote Host/Remote Port. This fully specifies the connection.

If the **open=yes** parameter is specified, the association's **lhost** and **lport** configuration must not match that of any open association.

If the card's application is **iplim** or **iplimi**, then the **adapter** parameter value and the **ipliml2** value for the assigned signaling link must be **m2pa**.

An association with an **adapter** value of **m2pa** cannot be assigned to an SS7IPGW or IPGWI host.

The M2PA version is supported if the application is IPLIMx and the **adapter=m2pa** parameter is specified. When changing the association adapter type to **m2pa** and a version is not specified, the **m2pa=rfc** value is assigned by default.

Table 5-4 shows the validation rules used to establish an association.

Table 5-4.
Validation Rules for Association Establishment

RHOSTVAL	RHOST Configured	ARHOST Configured	Source Parameter in IP Header	IP Address List in INIT/INIT ACK	Host Name Address Present in INIT/INIT ACK
RELAXED	Y	N	RHOST	NA (1 or more IP addresses can be present, not necessarily match RHOST.)	N
RELAXED	Y	N	NA	RHOST (other IP addresses can also be present)	N
RELAXED	Y	N	RHOST	NA	RHOST
MATCH	Y	N	RHOST	N	N
MATCH	Y	N	RHOST	RHOST only (no additional addresses can be present)	N
MATCH	Y	N	RHOST	NA	RHOSTonly
RELAXED	Y	Y	RHOST or ARHOST	NA	N
RELAXED	Y	Y	NA	RHOST or ARHOST	N
RELAXED	Y	Y	Same as Hostname	NA (Ignore any IP addresses present)	RHOST or ARHOST
MATCH	Y	Y	RHOST	ARHOST must be present. RHOST can also be present. No other	N

Table 5-4.
Validation Rules for Association Establishment

chg-atinpopts

Change ATINP Options

Use this command to provision ATINP-specific data. This command updates the ATINPQOPTS table.

Keyword: chg-atinpopts
Related Commands: rtrv-atinpopts
Command Class: Database Administration

Parameters

:atiackimsi= (optional)

ATIACK IMSI parameter for ATI ACK response message. This parameter specifies formatting of IMSI digits in the ATI ACK response message. The result of formatting determines whether the IMSI parameter will be included in the response.

Range: srfimsi, asd, grn, none

srfimsi— If an entity was found during RTDB lookup, and SRFIMSI was provisioned in the EPAP entity, then include the IMSI parameter and encode the IMSI digits as the SRFIMSI.

asd— If an entity was found during RTDB lookup and ASD (Additional Subscriber Data) was provisioned in the EPAP entity, then include the IMSI parameter and encode the IMSI digits as ASD.

grn — If an entity was found during RTDB lookup, and GRN (Generic Routing Number) was provisioned in the EPAP entity, then include the IMSI parameter and encode the IMSI digits as GRN.

none — Do not include the IMSI parameter in the response message.

Default: **none**

:atiackmsisdn= (optional)

MSISDN parameter for ATI ACK response message. This parameter specifies the formatting of MSISDN parameter in the ATI ACK response message. The result of formatting determines whether the MSISDN parameter will be included in the response.

Range: **msisdn, asd, asddlmsisdn, grn, grndlmsisdn, none**

msisdn — Include the MSISDN parameter in the ATI ACK response and encode MSISDN digits as the MSISDN from the incoming ATI query.

asd — If an entity was found during RTDB lookup and ASD (Additional Subscriber Data) was provisioned in the entity, then include the MSISDN parameter and encode the MSISDN digits as ASD.

asddlmsisdn — Include the MSISDN parameter in the ATI ACK response and encode MSISDN digits as ASD + delimiter (**atidlm**) + MSISDN. ASD is encoded if an entity is found and ASD is provisioned. The specified outbound message digits delimiter (**atidlm**) value is encoded if the value is not **none**. MSISDN is encoded as the MSISDN from the incoming ATI query.

grn — If an entity was found during RTDB lookup and GRN (Generic Routing Number) was provisioned in the EPAP entity, then include the IMSI parameter and encode the IMSI digits as GRN.

grndlmsisdn — Include the MSISDN parameter in the ATI ACK response and encode MSISDN digits as GRN + delimiter (**atidlm**) + MSISDN. GRN is encoded if GRN entity is found. The specified outbound message digits delimiter (**atidlm**) value is encoded if the value is not **none**. MSISDN is encoded as the MSISDN from the incoming ATI query.

none — Do not include the MSISDN parameter in the response message.

Default: **msisdn**

:atiackrn= (optional)

Routing number parameter for ATI ACK response message. This parameter specifies the formatting of the routing number parameter in the ATI ACK response message. The result of formatting determines whether the routing number parameter will be included in the response.

Range: **rn, rnsp, asddlmrnsp, rnspdlmasd, srfimsi, srfimsidlmgrn, asddlmsrfimsi, grndlmrnsp, rnspdlmgn, srfimsidlmgrn, grndlmsrfimsi, none**

rn — Routing number.

rnsp — Routing number or signaling point.

asddlmrnsp — ASD, delimiter and routing number or signaling point.

Format routing number digits as ASD (if supported and available from lookup entity) + **atidlm** (if not **none**) + entity digits (as described in the **atiackrn=rnsp** parameter).

rnspdlmasd — Routing number or signaling point, delimiter, ASD

Format routing number digits as entity digits (as described in **atiackrn=rnsp**) + delimiter (if **atidlm** is not **none**) + ASD (if supported and available from lookup entity).

srfimsi — Encode routing number digits as SRFIMSI configured in the entity data.

If SRFIMSI was not found (MSISDN not found in RTDB lookup, or MSISDN found but no entity found, or entity found but SRFIMSI not configured) then the routing number will not be included in the response message.

srfimsidlmasd — SRFIMSI, delimiter, ASD

Encode routing number digits as SRFIMSI + delimiter (if **atidlm** is not **none**) + ASD (if supported and available from lookup entity). SRFIMSI is encoded as described in the **atiackrn=srfimsi** option.

asddlmsrfimsi — ASD, delimiter, SRFIMSI

Encode routing number as ASD (if supported and available from lookup entity) + delimiter (if **atidlm** is not **none**) + SRFIMSI(encoded as specified in the **atiackrn=srfimsi** parameter).

grndlmrnsp — GRN, delimiter, Routing number or signaling point

Encode routing number as GRN (if supported and available from RTDB lookup) + delimiter (if **atidlm** is not **none**) + RNSP (encoded as specified in the **atiackrn=rnsp** parameter).

rnspdlmgrn — Routing number or signaling point, delimiter, GRN

Encode routing number as entity digits (as described in **atiackrn=rnsp**) + delimiter (if **atidlm** is not **none**) + GRN (if supported and available from RTDB lookup).

srfimsidlmgrn — SRFIMSI, delimiter, GRN

Encode routing number as SRFIMSI (encoded as specified in the **atiackrn=srfimsi** parameter) + delimiter (if **atidlm** is not **none**) + GRN (if supported and available from RTDB lookup).

grndlmsrfimsi — GRN, delimiter, SRFIMSI

Encode routing number as GRN (if supported and available from RTDB lookup) + delimiter (if **atidlm** is not **none**) + SRFIMSI (encoded as specified in the **atiackrn=srfimsi** parameter).

none — Do not include the Routing Number field in the response message.

Default: **rn**

:atidfltrn= (optional)

Default Routing Number. This parameter specifies the routing number to be used in outgoing message formats while encoding outgoing digit formats in the ATI ACK response in cases where an RN is not returned from an RTDB lookup.

Range: 1-15 digits, **none**
Valid digits are **0-9, A-F, a-f**.

Default: **none**

:atidlm= (optional)

Outbound message digits delimiter. This delimiter is used in outgoing message formats while encoding outbound digits in the ATI ACK response. This option can be set to **none** at any time by the user.

Range: 1-15 digits, **none**
Valid digits are **0-9, A-F, a-f**.

Default: **none**

:atinptype= (optional)

Number Portability Type. This parameter specifies the criteria for a successful RTDB lookup.

Range: **any, always**
any — MSISDN lookup is considered successful if any match is found (RN, SP, PublicDN, PrivateDN, match with no entity, or entity type is GRN or VMS and portability type is **none (0xff)**).

always— Lookup is always considered successful whether an MSISDN was found or not found in the RTDB.

Default: **any**

:entitylen= (optional)

Entity Length. This parameter specifies the maximum number of digits to be used from entity data (SRFIMSI or entity ID) in the specified encoding format.

Range: **1-15 none**

none - SRFIMSI or entity ID will be used without modification in the specified **atiackrn** parameter format.

Default: **none**

:snai= (optional)

Service NAI. This parameter specifies the number conditioning that is performed on the MSISDN digits in the incoming ATI query message before RTDB lookup is performed.

Range: **intl, nat, nai**

intl— Number conditioning is not performed.

nat— The default country code (defined in the **chg-stpopts** command **defcc** parameter) is pre-pended to the MSISDN before RTDB lookup.

nai— The NAI from the MSISDN in the incoming ATI query is used to perform number conditioning.. If the message NAI is International (0x1) or Network Specific Number (0x3) , then no conditioning is performed. In all other cases, the default country code (defined in the **chg-stpopts** command **defcc** parameter) is pre-pended to the MSISDN before RTDB lookup.

Default: **nai**

:sporttype= (optional)

Service Portability type. This parameter specifies the application of Service Portability that is applied to the associated feature.

The S-Port feature must be enabled before this parameter can be specified. The S-Port feature must be turned on before any change to the parameter will impact the associated feature.

If Service Portability is performed, then the Service Portability prefix (RTDB 'GRN'entity id) is applied.

Range: **gsm, is41, all, none**

gsm, none— apply Service Portability prefix for own-network GSM subscribers

is41, none— apply Service Portability prefix for own-network IS41 subscribers

all, none— apply Service Portability prefix for all own-network (IS41 and GSM) subscribers

none—Service Portability is not performed for the feature.

Default: No change to the current value

System

Default: **none**

Example

The following command specifies that the outbound message delimiter will not be used in outgoing message formats.

chg-atinpqopts:atidlm=none

The following command specifies that the NAI of the incoming MSISDN digits will be considered to be National, and that the IMSI parameter will not be included in the ATI ACK response message.

chg-atinpqopts:snai=nai:atiackimsi=none

The following command specifies that the lookup is always considered to be successful and that the NAI of the incoming MSISDN digits will be considered to be National.

chg-atinpqopts:atinptype=always:snai=nat

The following command specifies that the Routing Number field will not be included in the response, and that the MSISDN in the ATI ACK response will be encoded as the ASD.

chg-atinpqopts:atiackrn=none:atiackmsisdn=asd

The following command specifies that the Routing Number field will not be included in the response.

chg-atinpqopts:atiackrn=none

The following command specifies that the IMSI and MSISDN in the ATI ACK response will be encoded as GRN.

chg-atinpqopts:atiackimsi=grn:atiackmsisdn=grn

Dependencies

At least one optional parameter must be specified.

The ATINP feature must be enabled before this command can be entered.

The Service Portability feature must be enabled before the **sporttype** parameter can be specified.

Output

```

chg-atm-lps

Change ATM Link Parameter Set

Use this command to configure a link parameter set with timers and other parameters used by the system to provide level 2 functions for each ATM high-speed signaling link and to copy values from **lpset 20** and **30**, as well as any **lpset** to another.

Keyword: chg-atm-lps

Related Commands: ent-slk, rtrv-atm-lps

Command Class: Database Administration

Parameters

NOTE: Unless specified, the system default values are meant for both ANSI (T1) and ITU (E1) standards.

:lpset= (mandatory)

Link parameter set being changed.

NOTE: Sets 1 - 19 and 21 - 29 can be configured. Link parameter sets 20 and 30 are not configurable and are used to contain the recommended default values for a set.

Range: 1-19, 21-29

Default: 1 for ANSI
21 for ITU

:action= (optional)

This parameter copies a set of ATM signaling link parameters from one set to another.

Range: copy

Default: No change to the current value

- :maxcc=** (optional)
Maximum number of transmissions of BGN, END, ER, or RS PDU.
Range: 1-10
Default: 4
- :maxnrp=** (optional)
Maximum number of retransmitted PDUs during proving.
Range: 0-10
Default: 1 for ANSI
0 for ITU
- :maxpd=** (optional)
Maximum number of SD PDUs that can be sent before a POLL is sent.
Range: 5-2120
Default: 500
- :maxstat=** (optional)
Maximum number of list elements in a STAT PDU.
Range: 3-67
Default: 67
- :n1=** (optional)
Number of PDUs sent during proving.
Range: 500-64552
Default: 64552 for ANSI
1000 for ITU
- :nblk=** (optional)
Number of monitoring intervals per block.
Range: 1-10
Default: 3
- :srclpset=** (optional)
Source lpset for a copy action.
Range: 1-30
- :tmrcc=** (optional)
Timer value, in milliseconds, used during the connection phase to guard against unacknowledged BGN, END, ER or RS PDUs.
Range: 100-2000
Default: 200
- :tmrerm=** (optional)
Error rate monitor interval, in milliseconds.
Range: 25-500
Default: 100
- :tmridle=** (optional)
Timer value, in milliseconds, used during the idle phase when no SD PDUs are being sent to limit time in the idle phase.
Range: 25-1000
Default: 100
- :tmrkalive=** (optional)
Timer value, in milliseconds, used during the transient phase when no SD PDUs are being sent to keep connection up.

Range: 25-500
Default: 100

:tmrnocred= (optional)

The timer, in milliseconds, used when the no credit exists and PDUs are available to be sent.

Range: 1000-6000
Default: 1500

:tmrnorsp= (optional)

Timer value, in milliseconds, used to check that STAT PDUs are arriving often enough.

Range: 500-2000
Default: 1500

:tmrpoll= (optional)

Timer value, in milliseconds, used to guarantee that POLL PDUs are sent often enough.

Range: 25-500
Default: 100

:tmrprov= (optional)

The timer, in milliseconds, used to monitor the status of a link after it is placed into service.

Range: 60000-1200000
Default: 60000

:tmrsrec= (optional)

Timer value, in milliseconds, used to prohibit closely spaced SSCOP recoveries from occurring.

Range: 60000-10800000
Default: 3600000

:tmrt1= (optional)

Time, in milliseconds, between link release action and the next link reestablish action during alignment.

Range: 1000-15000
Default: 5000

:tmrt2= (optional)

Total time, in milliseconds, that SSCF will attempt alignment.

Range: 15000-180000
Default: 120000 for ANSI
 30000 for ITU (E1)

:tmrt3= (optional)

Time, in microseconds, between proving PDUs.

Range: 450-23000
Default: 925

Example

```
chg-atm-lps:lpset=5:tmrprov=1000:tmridle=55
```

```
chg-atm-lps:lpset=3:srclpset=5:action=copy
```

Dependencies

The values in link parameter sets **20** and **30** are the system default values. They cannot be changed but can be copied to another link parameter set.

The values of the **lpset** and **srclpset** parameters cannot be the same.

The **action** and **srclpset** parameters must be specified together.

If **action=copy** is specified, only the **lpset** and **srclpset** parameters can be specified.

At least one optional parameter must be specified.

Notes

If no parameter value for **lpset** is included when the **ent-slk** command is entered, the system default value of **1** is assigned for ANSI links and the system default value of **21** is assigned for ITU links.

All timer values for link parameter sets are initialized to the system default values.

Output

```
chg-atm-lps:lpset=5:tmrprov=1000:tmridle=55
```

```
rlghncxa03w 04-01-05 16:40:40 EST EAGLE 31.3.0
CHG-ATM-LPS: MASP A - COMPLTD
;
```

chg-attr-seculog

Change the Security Log Characteristics

Use this command to modify attributes that affect the operation of the security logging feature.

Keyword: **chg-attr-seculog**

Related Commands: **rtrv-attr-seculog**

Command Class: Security Administration

Parameters

:upldalm= (optional)

Enable or disable log alarms that pertain to uploading of the security log.

Range: **yes, no**

yes—Enables the log alarms pertaining to uploading of the log, as follows:

- Upload required
- Log overflowed
- Standby log contains greater than 0 un-uploaded entries

no—Prevents the log alarms from being raised when these conditions occur. Should the alarm already be raised when **no** is specified, the alarm is lowered.

Default: No change to the current value

:upslg= (optional)

Percent full threshold. This parameter specifies the percent full threshold for the security logs. If the **upldalm=yes** parameter is configured, an alarm is raised for the security log when the *%full* field (as displayed using the **rept-stat-seculog** command) in the log, on the active OAM, reaches or exceeds the value specified for **upslg**. This alarm indicates that the administrator must upload the log.

Range: **1-99**

Default: No change to the current value

Example

```
chg-attr-seculog:upslg=80:upldalm=yes
```

Dependencies

At least one optional parameter must be specified.

Notes

None

Output

```
chg-attr-seculog:upslg=80:upldalm=yes

rlghncxa03w 04-01-05 16:40:40 EST EAGLE 31.3.0
CHG-ATTR-SECULOG: MASP B - COMPLTD
;
```

chg-card**Change Card**

Use this command to change the configuration of a card in the database from an IPLIMx configuration to an IPSG configuration.

NOTE: As of Release 44.0, the user can provision whether the configuration is changed from an IPLIMx configuration to an IPSG configuration and from an E5-ENET to an E5-ENET-B card.

Keyword: chg-card

Related Commands: dlt-card, ent-card, init-card, rept-stat-card, rmv-card, rst-card, rtrv-card

Command Class: Database Administration

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:nappl= (optional)

This parameter specifies the new application for the card.

Range: *xyyyyyyy*

1 alphabetic character followed by up to 6 alphanumeric characters.

- **ipsg**—Used by E5-ENET and E5-ENET-B cards to support the combined functionality of IPLIMx M2PA and IPGWx M3UA

:type= (optional)

This parameter specifies whether an E5-ENET card or an E5-ENET-B card is used to support the IPSP configuration.

Range: **enet**, **enetb**

enet— the IPSP configuration is supported on an E5-ENET card

enetb— the IPSP configuration is supported on an E5-ENET-B card

Example

```
chg-card:loc=1105:nappl=ipsg
```

```
chg-card:loc=1305:type=enetb
```

Dependencies

The card location specified by the **loc** parameter cannot be **1113-1118**, or **xy 09** and **xy 10** where *x* is the frame and *y* is the shelf.

The specified shelf location must be provisioned and present in the frame.

The E5-ENET card must be inhibited and in an Out-of Service-state before the card can be changed. Only M2PA associations can be configured for the IP link host address for the card indicated by the **loc** parameter value. M3UA IP associations are not supported.

If the HIPR2 High Rate Mode feature is turned off, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 500,000. If the HIPR2 High Rate Mode feature is turned on, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 750,000.

The resulting total TPS of all signaling links cannot exceed the TPS supported by the card (E5-ENET: 5000 TPS, E5-ENET-B when E5-ENET-B IPSG High Throughput feature is OFF: 6500 TPS, E5-ENET-B when E5-ENET-B IPSG High Throughput feature is ON: 9500 TPS).

An E5-ENET card must be installed at the location indicated by the **loc** parameter.

The E5-ENET card must have a card type of DCM and must be running an IPLIMx application.

A value of **ipsg** must be specified for the **nappl** parameter.

The card in the location indicated by the **loc** parameter must already be equipped.

The **loc** parameter must be specified.

All links on the E5-ENET card must have a matching association configured. For IPLIM-hosted associations and links, a link and association are matched using the **link** parameter for the **ent-slk** and **ent-assoc** commands. For IPSG-hosted associations, a link and association are matched using the **aname** parameter for the **ent-slk** command.

The **nappl** or **type** parameter must be specified.

Output

```
chg-card:loc=1206:nappl=ipsg
  r1ghncxa03w 10-03-01 11:11:28 EST EAGLE 42.0.0
  CHG-CARD: MASP A - COMPLTD
;
```

chg-ckopts

Change Clock Options

Use this command to perform a software update of the clock elements and settings.

Keyword: **chg-ckopts**

Related Commands: **rtrv-ckopts**

Command Class: Database Administration

Parameters

:clock= (mandatory)

Clock to be updated.

Range: **primary, secondary, all**
primary — primary clock
secondary — secondary clock
all — all clocks

E5-TDM cards must be installed before a value of **primary** or **secondary** can be specified.

:force= (optional)

The **force=yes** parameter is used to change the **hscksrc** parameter value when the TDMs are reporting that the high speed system clocks are currently valid.

Range: **yes**

:hskll= (optional)

High speed master clock line length.

Range: **longhaul, shorthaul**

longhaul — Gain is high for long haul

shorthaul — Gain is low for short haul

Default: No change to the current value

System

Default: **longhaul**

:hsksrc= (optional)

High speed master clock source. The **force=yes** parameter must be specified with this parameter to change the clock source when the TDMs are reporting that the high speed system clocks are currently valid.

CAUTION: Changing the high speed master clock source can result in clock outage and loss of traffic on all links, if the new source type does not match the provisioned source for the E1 or T1 cards (what is actually plugged into the backplane).

Range: **rs422, e1framed, e1unframed, t1framed, t1unframed**

rs422 — RS-422 clock source

e1framed — E1 Framed clock source

e1unframed — E1 Unframed clock source

t1framed — T1 Framed clock source

t1unframed — T1 Unframed clock source

Default: No change to the current value

System

Default: **rs422**

Example

```
chg-clkopts:clock=primary:hsksrc=t1framed
```

```
chg-clkopts:clock=all:hsksrc=rs422:force=yes
```

```
chg-clkopts:hskll=shorthaul:clock=secondary
```

Dependencies

The parameters entered are not compatible with the card where the clock resides.

If the **hsksrc** and **clock=all** parameters are specified, and the high speed clocks are reporting, then the **force=yes** parameter must be specified.

The **hsksrc=rs422** parameter must be specified. The **hsksrc** parameter values **t1unframed**, **t1framed**, **e1unframed**, and **e1framed** cannot be specified if either TDM is a version that does not support the Global Timing Interface feature (both TDMs must be TDM-15 or later (including E5-TDM), with the Global Timing Interface loaded). The **hskll** parameter cannot be specified if either TDM is a version that does not support the Global Timing Interface feature (both TDMs must be TDM-15 or later (including E5-TDM), with the Global Timing Interface loaded).

Notes

Eagle Clocks with TDM-GTI

Figure 5-1 shows a general schematic of clocking, without any of the redundant backup features, in the EAGLE 5 ISS with the TDM-GTI card. Low and high speed reference clocks can be plugged into the control shelf backplane as input clocks. The TDM card uses these input clocks as timing references to generate the low and high speed clocks that are distributed to the cards in the EAGLE 5 ISS STP. These distributed clocks are used for various purposes depending on what types of links or features are provisioned.

Figure 5-1. Eagle Input and Internal Clocks with TDM-GTI

The high speed clock that is distributed to the cards in the EAGLE 5 ISS is used as the timing source only for high speed links that have been provisioned to use master timing. This clock can be derived only from the high speed input clock. Prior to TDM-GTI card, the high speed input clock could be only the RS422 type. The TDM-GTI card allows the clock to be recovered from a framed or unframed E1 or T1 signal interface.

The low speed composite clock that is distributed to the cards in the EAGLE 5 ISS is used for timing DS0 links and for the Time Slot Counter Synchronization (TSCSYNC) feature that is required for the Sentinel and IMF products. Prior to TDM-GTI this low speed clock could be generated only from a BITS clock source plugged into the control shelf backplane. TDM-GTI can generate this low speed internal clock from the high speed input clock source, with the following restriction:

- When DS0 cards are provisioned in the system, the internal low speed clock can be generated only from a BITS clock as it is without TDM-GTI.
- When no DS0 cards are present and the BITS clocks are present and valid, the internal low speed clock is generated from the BITS clocks.
- When no DS0 cards are present and the BITS clocks are not present or not valid, the internal low speed clock is generated from the high speed input clock.

Output

```
chg-clkopts:clock=primary:hsclocksrc=t1framed
e5oam 09-01-01 17:25:22 MST EAGLE 5 ISS 40.1.0
CHG-CLKOPTS: MASP B - COMPLTD
;
```

chg-cmd

Change Command Attributes

Use this command to change the attributes of a command.

Keyword: chg-cmd
Related Commands: rtrv-cmd
Command Class: Security Administration

Parameters

NOTE: All class(X) parameters consist of a configurable command class name (ayy), and indicator (-yes or -no) to specify whether the command class is allowed. A value of ayy-yes indicates that the value is allowed. A value of ayy-no indicates that the value is not allowed.

:cmd= (mandatory)
 The command whose attributes are to be changed.

Range: *xxxxxxxxxxxxxxxxxxxx*
One alphabetic character followed by up to 19 additional alphanumeric characters.

:class1= (optional)

This parameter specifies a configurable command class name and indicator to indicate whether the command class is allowed.

Range: *ayy*
1 alphabetic character followed by 2 alphanumeric characters
Specify the parameter value in the format *ayy -no* or *ayy -yes*.

Default: No change to current value

:class2= (optional)

This parameter specifies a configurable command class name and indicator to indicate whether the command class is allowed.

Range: *ayy*
1 alphabetic character followed by 2 alphanumeric characters
Specify the parameter value in the format *ayy -no* or *ayy -yes*.

:class3= (optional)

This parameter specifies a configurable command class name and indicator to indicate whether the command class is allowed.

Range: *ayy*
1 alphabetic character followed by 2 alphanumeric characters
Specify the parameter value in the format *ayy -no* or *ayy -yes*.

:class4= (optional)

This parameter specifies a configurable command class name and indicator to indicate whether the command class is allowed.

Range: *ayy*
1 alphabetic character followed by 2 alphanumeric characters
Specify the parameter value in the format *ayy -no* or *ayy -yes*.

:class5= (optional)

This parameter specifies a configurable command class name and indicator to indicate whether the command class is allowed.

Range: *ayy*
1 alphabetic character followed by 2 alphanumeric characters
Specify the parameter value in the format *ayy -no* or *ayy -yes*.

:class6= (optional)

This parameter specifies a configurable command class name and indicator to indicate whether the command class is allowed.

Range: *ayy*
1 alphabetic character followed by 2 alphanumeric characters
Specify the parameter value in the format *ayy -no* or *ayy -yes*.

:class7= (optional)

This parameter specifies a configurable command class name and indicator to indicate whether the command class is allowed.

Range: *ayy*
1 alphabetic character followed by 2 alphanumeric characters
Specify the parameter value in the format *ayy -no* or *ayy -yes*.

:nclass= (optional)

This parameter specifies the new configurable command class name.

Range: *ayy*

1 alphabetic character followed by 2 alphanumeric characters (*ayy*)

Default: No change to current value

Example

```
chg-cmdclass:class=abc:descr="my command class description"
```

```
chg-cmdclass:class=u23:nclass=dab:descr="his command class
description"
```

```
chg-cmdclass:class=dab:nclass=krb
```

Dependencies

At least one optional parameter must be specified.

The Command Class Management feature must be enabled and turned on before this command can be entered.

The **class** parameter value must be a valid configurable command class name (one of the default configurable command class names or a user-defined command class name).

The new command class name parameter value (**nclass**) must not be the same as an existing configurable or non-configurable command class name.

Notes

None

Output

```
chg-cmdclass:class=abc:descr="my command class description"
```

```
rlghncxa03w 04-01-05 16:40:40 EST EAGLE 31.3.0
```

```
CHG-CMDCLASS: MASP B - COMPLTD
```

```
;
```

chg-csl

Change Common Screening List

Use this command to change an existing entry in the Common Screening List (CSL). The Common Screening List commands are used to tailor certain types of general screening information to specific features.

Keyword: **chg-csl**

Related Commands: **dlt-csl, ent-csl, rtrv-csl, rtrv-ctrl-feat**

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

NOTE: The **p2** and **scpgta** parameters are used only by the Prepaid IDP Query Relay feature.

NOTE: The **p1** parameter is used only by the IDP Service Key Routing feature.

:ds= (optional)

Digit string. This parameter specifies a unique string of digits that is used by the specified screening feature.

Range: 1-15 digits

1 - 15 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.

- 1-6 digits—Prepaid IDP Query Relay **ccnc** list
- 1-15 digits—Prepaid IDP Query Relay **gt** list
- 1-10 digits—Prepaid IDP Query Relay **skbcm** list
- 4 digits—IDP Screening for Prepaid **skts** list
- 1-15 digits—IDP Screening for Prepaid **insl** list
- 1-15 digits—VFLEX **vmpfx** list
- 1-6 digits—Info Analyzed Relay Base **ccnc** list
- 1-15 digits—Info Analyzed Relay Base **gt** list
- 2 digits—Info Analyzed Relay Base **trig** list

Table 5-22 lists valid hexadecimal values for the Info Analyzed Relay Base **trig** list **ds** entries.

:feature= (optional)

Feature name. This parameter specifies the name of the enabled screening feature for which the command is entered.

NOTE: Either the pn parameter or the feature parameter must be specified to identify the feature.

Range: *aaaaaaaaaaaaaaaaaaaaaaaa*

1 alphabetic character followed by up to 24 optional alphanumeric characters, including spaces and special characters, enclosed in double quotation marks (" ").

Enter enough of the feature name to make the name unique if two features begin with the same word or acronym. The following feature names are valid for this command:

- Info Analyzed Relay Base
- IDP Screening for Prepaid
- Prepaid IDP Query Relay
- IDP Service Key Routing
- VFLEX

:list= (optional)

Common Screening List associated with the feature.

Range: **gt, skbcm, ccnc, skts, insl, vmpfx, trig, delpfx**

- gt**— Global Title List
- skbcm**— SK+BCSM List
- ccnc**— CC+NC List
- skts**— SK+TS List
- insl**— In Network Subscriber List
- vmpfx**— Voice Mail Prefix List
- trig**— Trigger List
- delpfx**— Delete Prefix List

The following screening lists are valid for the indicated features:

- **skts, insl**—IDP Screening for Prepaid
- **ccnc, gt**—Prepaid IDP Query Relay, Info Analyzed Relay Base

- **skbcm**—Prepaid IDP Query Relay and IDP Service Key Routing
- **vmpfx**—VFLEX
- **trig**—Info Analyzed Relay Base

The **delpfx** list is not supported at this time. This list should only be used by Tekelec personnel.

:p1= (optional)

Parameter Value 1. This parameter is specific to the feature and list that use the parameter.

Range: *xxxxxxxx*

Valid values for the IDP Service Key Routing feature are:

- **3** or **prepaid1**—Prepaid Portability Type 3 for the SKBCSM list
- **4** or **prepaid2**—Prepaid Portability Type 4 for the SKBCSM list
- **6-35** or **prepaid3-prepaid32**—Prepaid Portability Types 6 through 35 for the SKBCSM list
- **255** or **prepaidno**—No Prepaid Portability Type for the SKBCSM list

Valid values for the Prepaid IDP Query Relay feature are:

- **0, 1**—National or International for the DELPFX list, which is for Tekelec personnel use ONLY.

Default: No change to the current value

:p2= (optional)

Parameter Value 2. This parameter specifies the IDP Relay Service that is associated with an SKBCSM list DS entry. Multiple IDP Relay Services can be provisioned for use with NPP. The parameter value can be entered as a number or as the corresponding mnemonic.

Range: *xxxxxxxx*

- 1** or **idprcdpn**—IDPRCDPN Service for the SKBCSM list
- 2** or **idprcdpn2**—IDPRCDPN2 Service for the SKBCSM list
- 3** or **idprcdpn3**—IDPRCDPN3 Service for the SKBCSM list
- 4** or **idprcdpn4**—IDPRCDPN4 Service for the SKBCSM list

Default: No change to the current value

:p3= (optional)

Parameter Value 3. The parameter value is specific to the feature and list name that use this parameter. No feature currently uses this parameter.

:pc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **pca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (optional)

Point code. Either the **ds** parameter or a point code parameter must be specified.

:pci= (optional)

ITU international point code with subfields *zone-area-id*.

Range: **0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The point code **0-000-0** is not a valid point code.

zone—**0-7**

area—**000-255**

id—**0-7**

:pcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:pn= (optional)

Part Number. The 9-digit "893xxxxxx" part number of the feature for which the command is entered. The **rtrv-ctrl-feat** command description shows the part number in the command output example.

NOTE: Either the pn parameter or the feature parameter must be specified to identify the feature.

Range: **893000000-893999999**

The first 3 digits are **893**. Do not separate the digits with dashes or spaces. The following part numbers are valid for this command:

- **893015501**—IDP Screening for Prepaid
- **893016001**—Prepaid IDP Query Relay
- **893016701**—VFLEX

· **893034201**—Info Analyzed Relay Base

:scpgta= (optional)

Signaling Control Point (SCP) Global Title Address (GTA). This parameter specifies the value used by the SKGTARTG Service Action in IDP Relay IDPRCDPN(X) NPP Services to replace the SCCP CdPA GTA in the outgoing message.

Range: 1-21 digits, **none**
 1 - 21 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—Removes the provisioned digit string.

Default: No change to the current value

Example

```
chg-csl:feature="IDP Screening for
Prepaid":list=insl:ds=123456789bcdEF
chg-csl:feature="VFLEX":list=vmpfx:ds=123456789abcdEF
chg-csl:feature="Prepaid IDP Query
Relay":list=skbcsm:ds=0000000056:p2=idprcdpn4:scpgta=abce9875
```

Dependencies

An enabled feature must be specified using either a valid part number (**pn**) or feature name (**feature**). The specified feature must use a Common Screening List.

The feature that is specified by the **feature** parameter must already be enabled.

The **list** parameter must be specified for features that use more than one type of screening list.

The value specified for the **list** parameter must be valid for the specified screening feature.

The specified screening list entry must exist in the screening list that is used by the feature.

The length of the digit string that is specified for the **ds** parameter must be valid for the screening feature and list type.

A valid **ds** parameter value is required for the specified feature and list type.

The following parameters are allowed with the indicated common screening list type:

- **list=gt**—**ds** parameter
- **list=ccnc**—**ds** parameter
- **list=skbcsm**—**ds** and **scpgta** parameters
- **list=skts**—**ds** parameter
- **list=insl**—**ds** parameter
- **list=vmpfx**—**ds** parameter
- **list=trig**—**ds** parameter

The leading digit pattern of the value specified for the **ds** parameter must be unique in the specified screening list for the indicated feature.

The **pc** or **ds** parameter must be specified. The parameters cannot be specified together in the command.

The value specified for the **feature** parameter must be valid feature name for a feature that uses a Common Screening List. The feature name must be specified as it appears in the **rtrv-ctrl-feat** command output. Enough of the name must be specified to make the name unique when two features begin with the same word or acronym.

The **scpgta** and **pc** parameters cannot be specified together in the command.
If the **scpgta** parameter is specified, then the **ds** parameter must be specified.

Notes

None

Output

```
chg-csl:pn="Prepaid IDP Query
Relay":list=skbcm:ds=000000056:p2=idprcdpn4:scpgta=abce9875
tekelecstp 10-10-20 14:46:49 EST EAGLE 43.0.0
SK+BCSM List ( 7 of 150) 5%
CHG-CSL: MASP A - COMPLTD
;
```

chg-ctrl-feat

Change Controlled Feature

Use this command for controlled features that have been purchased and enabled with the **enable-ctrl-feat** command to turn on or turn off On/Off features and to turn on Permanently On features (cannot be turned off after they have been turned on)

Use this command when the system station shows an expired temporary key and the administrator wants to clear the CRITICAL system alarm without purchasing a permanent Feature Access Key.

Keyword: **chg-ctrl-feat**

Related Commands: **enable-ctrl-feat**, **rtrv-ctrl-feat**

Command Class: Database Administration

Parameters

:partnum= (mandatory)

Part number. This parameter specifies the part number for the feature.

Range: **893000000 - 893999999**

Do not include dashes in the 9-digit number.

:alarm= (optional)

Clears alarms when temporary feature keys have expired.

Range: **clear**

:status= (optional)

Changes the operational status of the feature.

Range: **on, off**

Default: No change in current status

Example

```
chg-ctrl-feat:partnum=893xxxxxx:status=on
```

```
chg-ctrl-feat:partnum=893xxxxxx:alarm=clear
```

Dependencies

The controlled feature specified by the **partnum** parameter must be enabled (see the **enable-ctrl-feat** command) before this command can be entered.

One of the optional parameters, but not both, must be specified in the command.

To use this command to turn off a feature, the Part Number specified in the command must be for one of the following On/Off features that is currently on. (A Permanently On feature is turned on with this command; after the feature has been turned on, it cannot be turned off with this command):

- 893018001 1100 TPS/DSM for ITU NP

- 893022101 ATI Number Portability Query (ATINP)
- 893017601 Circ Route Auto-Recovery
- 893005801 Command Class Management
- 893400001 EAGLE OA&M IP Security
- 893018101 Enhanced Far-End Loopback
- 893015401 Flexible GTT Load Sharing (FGTTLS)
- 893027401 GTT Load Sharing with Alternate Routing Indicator (GTT LS ARI)
- 893020101 HIPR2 High Rate Mode
- 893025701 IDPR ASD
- 893025601 IDPR GRN
- 893035001 Info Analyzed Relay ASD
- 893035101 Info Analyzed Relay GRN
- 893026101 Info Analyzed Relay NP
- 893038901 Integrated GLS
- 893006901 Intermediate GTT Load Sharing (IGTTLS)
- 893005701 IP User Interface (Telnet)
- 893018401 Large BICC MSU Support for IP Signaling
- 893006601 LNP Short Message Service (LNP SMS)
- 893007001 MNP Circular Route Prevention
- 893026701 MO SMS ASD
- 893024601 MO SMS B-Party Routing
- 893026601 MO SMS GRN
- 893026201 MO SMS IS41-to-GSM Migration
- 893013501 MTP Map Screening
- 893009101 Network Security Enhancement
- 893039301 NPP Unlimited SDWC Characters
- 893009301 Portability Check for Mobile Originated SMS
- 893006701 Prepaid SMS Intercept Phase 1 (PPSMS)
- 893018801 SEAS over IP
- 893034301 Service Portability
- 893024501 TIF ASD
- 893025501 TIF GRN
- 893022501 TIF Number Substitution
- 893037701 TIF Range CgPN Blacklist
- 893037601 TIF Subscriber CgPN Blacklist

Turning on a feature that is already on or turning off a feature that is already off has no effect.

The GTT feature must be turned on (see the **chg-feat** command) before the following features can be turned on:

- Intermediate Global Title Translation Load-Sharing (IGTTLS)
- LNP ELAP Configuration
- SCCP Loop Detection

All IPSM cards in the system must be inhibited before the IP User Interface (Telnet) feature can be turned on or off.

All IPSM cards in the system must be inhibited before the EAGLE OA&M IP Security Enhancements feature can be turned on or off.

Only one of the optional parameters, not both, can be specified in the command.

After a Permanently On feature is turned on, it cannot be turned off with this command. All controlled features with quantity feature access keys (like LNP ported TNs) and the following features are Permanently On features:

- 15 Minute Measurements
- Advanced GTT Modification (AMGTT)
- Advanced GTT Modification Called Party Only (AMGTT CdPA Only)
- Advanced GTT Modification Calling Party Upgrade (AMGTT CgPA Upgrade)
- ANSI-41 INP Query
- ANSI-41 Mobile Number Portability (A-Port)
- ANSI/ITU SCCP Conversion
- E5-OAM Integrated Measurements (Integrated Measurements)
- Enhanced GSM MAP Screening (EGMS)
- Equipment Identity Register (EIR)
- Flexible Linkset Optional Based Routing (FLOBR)
- G-Flex MAP Layer Routing
- G-Port SRI Query for Prepaid
- GSM Flexible Numbering (G-Flex)
- GSM MAP Screening (GMS)
- GSM MAP SRI Redirect for Serving HLR
- GSM Mobile Number Portability (G-Port)
- GTT Action - DISCARD
- GTT Action - DUPLICATE
- GTT Action - FORWARD
- Hex Digit Support for GTT
- IDP A-Party Blacklist
- IDP A-Party Routing
- IDP Screening for Prepaid

- IDP Service Key Routing
- Info Analyzed Relay Base (IAR)
- INP
- IS41 GSM Migration (IGM)
- ISUP NP with EPAP
- ITU TCAP LRN Query (LRNQT)
- ITUN-ANSI SMS Conversion
- LNP ELAP Configuration
- LOCREQ Query Response
- MO-based GSM SMS NP
- MO-based IS41 SMS NP
- MT-Based GSM SMS NP
- MT-Based GSM MMS NP
- MT-Based IS41 SMS NP
- MTP Msgs for SCCP Apps
- Multiple Linkset to a Single Adjacent Point Code
- Origin-Based MTP Routing
- Origin-based SCCP Routing
- PC & CIC Translation (PCT)
- Prepaid IDP Query Relay
- SCCP Loop Detection
- Service Portability (S-Port) Subscriber Differentiation
- SLS Bit Rotation by Incoming Linkset (ISLSBR)
- Spare Point Code Support
- Support for 16 GTT Lengths in VGTT
- TCAP Opcode Based Routing (TOBR)
- TCAP Opcode Quantity
- TIF Number Portability
- TIF SCS Forwarding
- TIF Simple Number Substitution
- Transaction-based GTT Loadsharing (TBGTTLs)
- Voice Mail Router (V-Flex)
- Weighted GTT Loadsharing (WGTTLs)
- XUdT UDT Conversion

The value specified for the **partnum** parameter must be the correct part number for the purchased feature.

The **platformenable=on** or the **oamhcmeas=on** parameter must be specified (see the **chg-measopts** command) before the 15 Minute Measurements feature can be turned on.

If the Measurements Platform feature is turned on (see the **chg-feat** command) as a precursor to turning on the 15 Minute Measurements feature, then at least one MCPM card must be available in the IS-NR state before the 15 Minute Measurements feature can be turned on. The **platformenable=on** parameter must be specified (see the **chg-measopts** command) before an MCPM card can be placed in the IS-NR state.

The 15 Minute Measurements feature cannot be turned on when 30 minute measurements collection is in progress.

The Global Title Translation (GTT) feature must be turned on (using the **gtt=on** parameter for the **chg-feat** command) before the Intelligent Network Application Part (INAP) Number-based Portability (INP) feature or the ANSI-41 INP Query (AINPQ) feature can be turned on.

The A-Port, G-Port, or IGM feature must be turned on before the MNP Circular Route Prevention feature can be turned on.

The SEASCLI must be provisioned (see the **chg-seas-config** command) before the SEAS Over IP feature can be turned on.

At least one SEAS terminal must be configured (see the **chg-trm** command) before the SEAS Over IP feature can be turned on.

The IP address of at least one E5-IPSM or E5-ENET-B card associated with a SEAS terminal must be configured before the SEAS Over IP feature can be turned on.

The IP User Interface feature must be turned on before the SEAS Over IP feature can be turned on.

The **login** and **hname** parameters must be provisioned (see the **chg-seas-config** command) before the SEAS Over IP feature can be turned on.

If the SEAS Over IP feature is turned on, then the IP User Interface feature cannot be turned off.

All card locations that correspond to SEAS terminals must be provisioned with E5-IPSM or E5-ENET-B cards before the SEAS Over IP feature can be turned on.

The A-Port feature must be turned on before the MT-Based IS41 SMS NP feature can be turned on.

The G-Port feature must be turned on before the MT-Based GSM SMS NP feature can be turned on.

HIPR2 cards must be installed in all MUX locations before the HIPR2 High Rate Mode feature can be turned on.

The **defcc** system option (see the **chg-stpopts** command) must be provisioned before the IAR Base feature can be enabled and before the ATINP, MT-based GSM SMS NP, or MT-Based IS41 SMS NP feature can be turned on.

The **defmcc** GSM option (see the **chg-gsmopts** command) must be provisioned before the MT-Based GSM SMS NP feature can be turned on.

The MT-Based GSM SMS NP feature must be turned on before the MT-Based GSM MMS NP feature can be turned on.

An IDPRCDPN(X) NPP service must be ON before the Prepaid IDP Query Relay feature can be turned on.

The **defcc** and **defndc** system options (see the **chg-stpopts** command) must be provisioned before the V-Flex feature can be turned on.

The Prepaid IDP Query Relay feature must be turned on before the IDPR ASD or IDPR GRN feature can be turned on.

The **matchseq=dn** parameter must be specified (see the **chg-tifopts** command) before the TIF GRN feature can be turned on.

The **matchseq=dn** parameter must be specified (see the **chg-tifopts** command) before the TIF ASD feature can be turned on.

The GTT LS ARI feature must be turned off before the IGTTLS feature can be turned off.

The HIPR2 High Rate Mode feature cannot be turned on or off if an IMT Rate Change sequence is in progress.

If the provisioned System TPS (SIGTRAN TPS + ATM TPS) is greater than 500,000, then the HIPR2 High Rate Mode feature cannot be turned off.

The flashing process must be complete on all MUX cards before the HIPR2 High Rate Mode feature can be turned on or off.

The HIPR2 High Rate Mode feature cannot be turned on or off during an Extended Bit Error Rate Test (BERT).

The **crptt** parameter must have a value of **none** (see the **chg-gsmopts** command) before the MNP CRP feature can be turned off.

The HIPR2 High Rate Mode feature cannot be turned on or off during upgrade.

The Default Country Code must be provisioned (see the **defcc** parameter in the **chg-stpopts** command) before the Prepaid IDP Query Relay feature can be turned on.

At least one terminal without a Thermal Alarm must exist before the SEAS Over IP feature can be turned on.

The INP and AINPQ features cannot be turned on if the LNP (an LNP ported TNs quantity), LNP 150,000 LRNs, or LNP 300,000 NPANXX feature is enabled and on.

The LNP ELAP Configuration feature and the WNP feature must be turned on before the LNP SMS feature can be turned on.

A temporary feature access key cannot be used to turn on features that do not allow a temporary feature access key. The following features allow a temporary feature access key:

- 15 Minute Measurements
- Command Class Management
- EAGLE OA&M IP Security
- IDP Screening for Prepaid
- Intermediate GTT Load Sharing (IGTTLS)
- LNP ELAP Configuration
- LNP Short Message Service (LNP SMS)
- MNP Circular Route Prevention
- Network Security Enhancements
- Portability Check for MO SMS
- Prepaid IDP Query Relay
- SCCP Conversion
- Telnet

If a **chg-ctrl-feat** command is already in progress, then another **chg-ctrl-feat** command cannot be entered.

If a single digit wildcard (?) is specified as a value for the **fpx** parameter more than 25 times across all of the rules for an NPP service (see the **ent-npp-srs** command), then the NPP Unlimited SDWC Characters feature cannot be turned off.

If more than three single digit wildcard characters (?) are specified for the **fpx** parameter in an NPP Service rule (see the **ent-npp-srs** command), then the NPP Unlimited SDWC Characters feature cannot be turned on.

If a single digit wildcard (?) is specified after the sixth digit of the value specified for the **fpx** parameter for an NPP Service rule (see the **ent-npp-srs** command), then the NPP Unlimited SDWC Characters feature cannot be turned on.

The E5-ENET-B IPSG High Throughput feature cannot be turned off if an E5-ENET-B card running the IPSG application in the system has a configured card capacity above 6500 TPS.

Notes

All terminals that are configured as SEAS are automatically allowed or inhibited when the SEAS Over IP feature is turned on or off, respectively.

Commands blocked during IMT Rate Change sequence:

If the HIPR2 High Rate Mode feature is turned on or off, then an IMT Rate change sequence is carried out (if required). The **alw-imt**, **disc-imt**, **flash-card**, **inh-imt**, **init-flash**, **init-mux**, and **tst-imt** commands cannot be entered if an IMT Rate Change sequence is in progress.

Service Portability

If the Service Portability feature is turned on before a dependant feature is turned on, then a warning is issued:

WARNING: No Service Portability dependent feature is on.

If the Service Portability feature is turned off when more than one dependent feature is turned on, then a warning is issued:

WARNING: Service Portability is OFF.

MTT 2017, 3517, 3987, 3988, 4177, 4295, 4579, 4614, 5093 deleted for PR 194867 in rel 43.0

Output

```

chg-ctrl-feat:partnum=893xxxxxx:status=on
tekelecstp 06-07-26 14:47:49 EST EAGLE 36.0.0
chg-ctrl-feat:partnum=893xxxxxx:status=on
Command entered at terminal #4.

chg-ctrl-feat:partnum=893xxxxxx:alarm=clear
Command entered at terminal #4.
CHG-CTRL-FEAT: MASP A - COMPLTD
;

tekelecstp 06-07-26 14:47:49 EST EAGLE 36.0.0
0367.0181 * SYSTEM Temp Key(s) expiration alarm cleared.
;

```

The following example displays the output that results when the 1100 TPS/DSM for ITU NP feature is on, and the **chg-ctrl-feat** command is re-entered within 30 seconds for confirmation.

```

chg-ctrl-feat:partnum=893018001:status=on
tekelecstp 06-07-26 14:47:49 EST EAGLE 36.0.0
chg-ctrl-feat :partnum=893018001:status=on
Command entered at terminal #4.
CAUTION: Rated TPS for this feature supports an engineered GTT
traffic mix of no more than 70 percent EPAP-based traffic.
Re-enter the command within 30 seconds to confirm change.
CHG-CTRL-FEAT: MASP A - Command Aborted

```

Command is re-entered within 30 seconds

```

chg-ctrl-feat :partnum=893018001:status=on

```

```

tekelecstp 06-07-26 14:47:58 EST EAGLE 36.0.0
chg-ctrl-feat :partnum=893018001:status=on
Command entered at terminal #4.
CHG-CTRL-FEAT: MASP A - COMPLTD

```

The following example displays the output that results when the 1100 TPS/DSM for ITU NP feature is on, and the **chg-ctrl-feat** command is not re-entered within 30 seconds.

```

chg-ctrl-feat:partnum=893018001:status=on
tekelecstp 06-07-26 14:47:49 EST EAGLE 36.0.0
chg-ctrl-feat :partnum=893018001:status=on
Command entered at terminal #4.
CAUTION: Rated TPS for this feature supports an engineered GTT
traffic mix of no more than 70 percent EPAP-based traffic.
Re-enter the command within 30 seconds to confirm change.
CHG-CTRL-FEAT: MASP A - Command Aborted

```

Command is not re-entered within 30 seconds.

```

CHG-CTRL-FEAT command aborted due to confirmation timeout.

```

The following example displays the output that results when the 1100 TPS/DSM for ITU NP feature is not on, and the **chg-ctrl-feat** command is re-entered within 30 seconds for confirmation.

```

chg-ctrl-feat:partnum=893018001:status=off
tekelecstp 06-07-26 14:47:49 EST EAGLE 36.0.0
chg-ctrl-feat :partnum=893018001:status=off
Command entered at terminal #4.
CAUTION: This command decreases the total TPS of the
SCCP system from 1100 to 850 TPS for each DSM.
Re-enter the command within 30 seconds to confirm.
CHG-CTRL-FEAT: MASP A - Command Aborted

```

Command is re-entered within 30 seconds

```
chg-ctrl-feat :partnum=893018001:status=off

chg-ctrl-feat :partnum=893018001:status=off
Command entered at terminal #4.
CHG-CTRL-FEAT: MASP A - COMPLTD
```

chg-db

Change Database

Use this command to manipulate elements of the database.

CAUTION: When this command is entered, all other database operations are locked out while the command executes.

CAUTION: The cards that run both the active and standby OAM reboot whenever the restore operation completes successfully. When a database is repaired successfully, the card with the standby OAM reboots. This action purges old database data from memory and reloads the MASPs with the new data. When the card with the active OAM reboots, all terminals reinitialize, automatically logging off all users. Depending on the new database, the terminals may be initialized to a different configuration, and user IDs and passwords may change.

Keyword: chg-db

Related Commands: copy-meas, rept-stat-db

Command Class: System Maintenance

Parameters

NOTE: The removable cartridge is used with legacy MDAL cards. The removable drive is used with E5-MASP hardware.

:action= (mandatory)

The database management action.

Range: **backup, repair, restore**

backup— Copies the database from the current data partitions to the backup partitions on both fixed disks, the backup partition on the removable cartridge, the removable drive, or to a compressed tar file on a remote FTP server. If the destination is the server a database file with the following naming convention will be created: 'CLLI string' - 'Release number string' - 'yymmddhh'.tar.gz (tekelecstp-37.5.0-08012212.tar.gz)

repair— Copies the current and backup databases from the active to the standby fixed disk.

restore— Copies the backup partitions to the current data partitions on both fixed disks, or copies the database from the removable cartridge or drive, or the remote FTP server to the current partitions on both fixed disks.

CAUTION: The action=restore parameter initiates an emergency recovery procedure and requires the init-sys command to download the restored database to all the cards in the system.

:dest= (optional)

Destination. This parameter specifies the destination disk for the database backup.

Range: **remove, fixed, server, usb**

remove— Back up the database to a removable cartridge or drive

fixed— Back up the database to a fixed disk

server— Back up the database to a remote server

usb— Argument to be used by Tekelec personnel only.

Default: fixed

:file= (optional)

This parameter specifies the name of the TAR file on the remote server that contains the database to be restored to the system.

The **src=server** parameter must be specified before this parameter can be specified.

Range: Up to 39 alphanumeric characters

:sloc= (optional)

Source location. This parameter specifies the location of the removable drive.

The **sloc** parameter can be used to specify a location in the active or standby E5-MASP.

Range: 1113, 1115

Default: location in the active E5-MASP

:src= (optional)

Source. This parameter specifies the source used to restore the database.

Range: remove, fixed, server, usb
remove — Restore the database from a removable cartridge or drive
fixed — Restore the database from the fixed disk
server — Restore the database from a remote server
usb — Argument to be used by Tekelec personnel only.

Default: fixed

Example

```
chg-db:action=backup:dest=server
chg-db:action=restore:src=remove
chg-db:action=repair
chg-
db:action=restore:src=server:file="CLLI-37.5.0-08012212.tar.gz"
```

Dependencies

The **chg-db** command cannot be entered while the system is in upgrade mode.

The removable drive must be accessible and ready and must be formatted as a system removable disk, NOT as a measurement removable disk.

The **dest** parameter can be specified only when **action=backup**. If the **dest=fixed** parameter is specified, or the **dest** parameter is not specified, the database on the current partition of the fixed disk is copied to the backup partition of the fixed disk. This action is shown in Figure 5-2.

Figure 5-2. The **chg-db:action=backup:dest=fixed** Command

The current database partition of both fixed disks must be free of integrity violations (for example, incoherency, inconsistency, and data corruption) when **action=backup** is specified.

The **src** parameter can be used only when **action=restore**. To restore the database, if the **src=fixed** parameter is specified or the **src** parameter is not specified, the backup partition of each fixed disk is copied to the current partition of the fixed disk. This action is shown in Figure 5-3.

Figure 5-3. The **chg-db:action=restore:src=fixed** Command

The backup database partition of both fixed disks must be coherent when **chg-db:action=restore:src=fixed** is specified.

The database on the removable cartridge or drive must be coherent when **action=restore:src=remove** is specified.

The current and backup database partitions of the active fixed disk must be free of integrity violations (for example, incoherency and data corruption) when **action=repair** is specified.

When the **action=repair/restore/repair** parameter is specified, the database(s) serving as the source of data for the operation must be free of integrity violations (for example, incoherency and data corruption).

All databases involved in the operation must contain a valid database version information.

The **action=restore** and **src=server** parameters must be specified before the **file** parameter can be specified. If the **src=server** parameter is specified, then the **file** parameter must be specified. The **action=restore** and **src=remove** parameters must be specified before the **sloc** parameter can be specified.

The DB application server must be provisioned (see the **ent-ftp-serv** command) before the **chg-db:action=backup:dest=server** or **chg-db:action=restore:src=server** command can be entered.

An E5-IPSM or E5-ENET-B card must be provisioned before the **chg-db:action=restore:src=server** or **chg-db:action=backup:dest=server** commands can be entered.

The standby MASP must be in the Active state before the **chg-db** command can be entered.

If E5-MASP hardware is used for a restore procedure, and if the active and standby removable drives installed in the latched USB port have different DB levels, then the **sloc** parameter must be specified in the **chg-db:action=restore:src=remove** command to specify the removable drive to be used.

The value specified for the **file** parameter must have the correct extension.

A value of **1113** or **1115** must be specified for the **sloc** parameter.

If the OAM is in mixed mode, and the 10,000 Routesets or Integrated GLS feature is enabled or the Integrated Measurements feature is turned on, then the **action=repair** parameter cannot be specified.

Notes

When the **chg-db** command is entered with the **action=backup** parameter, the following message appears when an audit is in progress:

```
Command In Progress: waiting for database audit to complete
```

The command executes when the audit is finished.

Performance

For **chg-db** command activities using the **backup**, **restore** and **repair** parameter values, the performance time varies depending on the number of records allocated for the database, system activity, and system setup. These operations should typically take no longer than 30 minutes. If one of these operations exceeds one hour, contact the Customer Care Center. See the "Customer Care Center" section in Chapter 1 of this manual.

If the **dest=remove** parameter is specified on the GPSM-II card, the database on the current partition of the active fixed disk is copied to the removable cartridge in the MDAL. This action is shown in Figure 5-4.

Figure 5-4. The **chg-db:action=backup:dest=remove** Command

If the **chg-db:action=restore:src=server:filename=xxxxxx.tar** or **chg-db:action=backup:dest=server** command is entered, the database partitions are copied from or to the remote server application through an E5-IPSM or E5-ENET-B card. This action is shown in Figure 5-5.

Figure 5-5. Remote Backup or Restore

If the **action=repair** parameter is specified, the current and backup database partitions are copied from the active fixed disk to the standby fixed disk. This action is shown in Figure 5-6.

Figure 5-6. The **chg-db:action=repair** Command

If the **src=remove** parameter is specified on the GPSM-II card, the database on the removable cartridge is copied to the current partitions on both the active and standby fixed disks. This action is shown in Figure 5-7.

Figure 5-7. The **chg-db:action=restore:src=remove** Command

If the **action=restore** and **src=remove** parameters are specified on the E5-MASP hardware, the database of the removable drive (in the latched USB slot) is copied to the current partition of each fixed disk. The default is to use the removable drive in the active E5-MASP. The **sloc** parameter can be used to specify the removable drive in the active or standby E5-MASP.

If the **dest=remove** parameter is specified for an E5-MCAP card, the database on the current partition of each fixed disk is copied to the removable drive in both latched USB slots. If only the active OAM has a removable drive, then only the current partition on the active OAM is copied to the removable drive in the active OAM latched USB slot.

Output

The output of the various actions of the **chg-db** command is shown in the following examples. Messages such as UIMs might appear at your terminal.

chg-db:action=backup

```
BACKUP (FIXED): MASP B - Backup starts on active MASP.
BACKUP (FIXED): MASP B - Backup on active MASP to fixed disk complete.
BACKUP (FIXED): MASP B - Backup starts on standby MASP.
BACKUP (FIXED): Backup on standby MASP to fixed disk complete.
```

chg-db:action=restore

```
RESTORE (FIXED): MASP A - Restore starts on active MASP.
RESTORE (FIXED): MASP A - Restore from fixed disk on active MASP complete.
RESTORE (FIXED): MASP A - Restore starts on standby MASP.
RESTORE (FIXED): MASP A - Restore from fixed disk on standby MASP complete.
RESTORE (FIXED): MASP A - MASP(s) will reboot to load data.
```

chg-db:action=backup:dest=remove

```
BACKUP (REMOVABLE) : MASP A - Backup starts on active MASP.
BACKUP (REMOVABLE) : MASP A - Backup to removable cartridge complete.
```

chg-db:action=backup:dest=fixed

```
BACKUP (FIXED) : MASP A - Backup starts on active MASP.
BACKUP (FIXED) : MASP A - Backup on active MASP to fixed disk complete.
BACKUP (FIXED) : MASP A - Backup starts on standby MASP.
BACKUP (FIXED) : MASP A - Backup on standby MASP to fixed disk complete.
```

chg-db:action=restore:src=remove

```
RESTORE (REMOVABLE) : MASP A - Restore starts on active MASP.
RESTORE (REMOVABLE) : MASP A - Restore starts on standby MASP.
RESTORE (REMOVABLE) : MASP A - MASP(s) will reboot to load data.
RESTORE (REMOVABLE) : MASP A - Restore from removable cartridge complete.
```

chg-db:action=restore:src=fixed

```
RESTORE (FIXED) : MASP A - Restore starts on active MASP.
RESTORE (FIXED) : MASP A - Restore from fixed disk on active MASP complete.
RESTORE (FIXED) : MASP A - Restore starts on standby MASP.
RESTORE (FIXED) : MASP A - MASP(s) will reboot to load data.
RESTORE (FIXED) : MASP A - Restore from fixed disk on stdby MASP complete.
```

chg-db:action=repair

```
REPAIR: MASP A - Repair starts on standby MASP.
REPAIR: MASP A - Standby MASP will reboot to load data.
REPAIR: MASP A - Repair from fixed disk complete.
```

chg-db:action=backup:dest=server

```
BACKUP (SERVER): MASP A - Backup starts on active MASP.
BACKUP (SERVER) : Copy Database to card memory for processing.
BACKUP (SERVER) : Compress Database before archiving.
BACKUP (SERVER) : Send database archive to server.
BACKUP (SERVER): MASP A - Backup to remote server complete.
```

chg-**db:action=restore:src=server:file="CLLI-37.5.0-08011112.tar.gz"**

```
RESTORE (SERVER) : Retrieve database archive from server.
RESTORE (SERVER) : Validate database archive.
RESTORE (SERVER) : Restore starts on active MASP.
RESTORE (SERVER) : Restore from server on active MASP complete.
RESTORE (SERVER) : Restore starts on standby MASP.
RESTORE (SERVER) : Restore from server on standby MASP complete.
RESTORE (SERVER) : MASP(s) will reboot to load data.
```

chg-dstn**Change Destination**

Use this command to change the characteristics of the point codes that are considered destinations from this signal transfer point (STP). A destination does not have to be an adjacent signaling point, but the system must be able to route traffic to this destination.

Keyword: **chg-dstn**

Related Commands: **chg-rte, dlt-dstn, dlt-rte, ent-dstn, ent-rte, rept-stat-dstn, rept-stat-rte, rtrv-dstn, rtrv-rte**

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:dpc= (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **dpc**

Range: **p-, 000-255, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

The asterisk value (*) is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (mandatory)

Destination point code.

:dpci= (mandatory)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (mandatory)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—**s-, p-, ps-**
nnnnn—**0-16383**
gc—**aa-zz**
m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (mandatory)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—**p-**
msa—**000-255**
ssa—**000-255**
sp—**000-255**

:aliasa= (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Range: **000-255, none**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
 When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.
 When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.
 When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.
 Enter **none** to delete the point code.
 The point code **000-000-000** is not a valid point code.

:aliasa/aliasi/aliasn/aliasn24= (optional)

Alias point code.

:aliasi= (optional)

ITU international alias point code list with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

If an ITU international destination (**dpci**) point code is entered, the **dpci** and **aliasi** *prefix* subfields cannot be the same, (both spare or both non-spare). Up to 2 comma-delimited entries can be entered in the point code list.

Range: **s-, 0-255, none**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—**s-**
zone—**0-7**
area—**000-255**
id—**0-7**
 Enter **none** to delete the point code.
 The point code **0-000-0** is not a valid point code.

:aliasn= (optional)

ITU national alias point code list in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

If an ITU national destination (**dpcn**) point code is entered, then the **dpcn** and **aliasn** *prefix* subfields cannot be the same (both spare or both non-spare). Up to 2 comma-delimited entries can be entered in the point code list.

Range: **s-, 0-16383, aa-zz, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

Enter **none** to delete the point code.

:aliasn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Enter **none** to delete the point code.

:bei= (optional)

Broadcast exception indicator. This parameter specifies whether the STP broadcasts network management messages to adjacent signaling points. The network management messages contain information about the indicated cluster and any of that cluster's member signaling points that are on its exception list. The messages whose broadcast is determined by this parameter are:

- TFP—Transfer Prohibited
- TCP—Transfer Cluster Prohibited
- TFA—Transfer Allowed
- TCA—Transfer Cluster Allowed

Range: **yes, no**

yes — Network management messages are not broadcast

no — Network management messages are broadcast

Default: No change to the current value

:cli= (optional)

Common Language Location Identifier assigned to the destination.

Range: *ayyyyyyyyyyy*

1 alphabetic character followed by 10 alphanumeric characters

Default: No change to the current value

:lei= (optional)

Exception-list exclusion indicator, for cluster destinations only. This parameter specifies whether the system *excludes* or *includes (maintains)* a dynamic status exception list (x-list) for each cluster route used to reach the member signaling points that make up the cluster.

Range: **yes, no**
 yes — Do not maintain a dynamic status x-list
 no — Maintain a dynamic status x-list

Default: No change to current value.

:homescp= (optional)

This parameter specifies whether the destination point code is considered a Home SCP when performing SCCP processing for messages with no Global Title Address Digits (Global Title Indicator (GTI) is set to zero).

This parameter can only be set to "yes" for full DPCs.

Range: **yes, no**
 yes — the DPC is considered a Home SCP
 no — the DPC is not considered a Home SCP

Default: No change to the current value

:homescp= (optional)

This parameter specifies whether the DPC is considered a Home SMSC when performing SCCP processing for messages with no Global Title Address Digits (GTI is set to zero).

This parameter can only be set to "yes" for full DPCs.

Range: **yes, no**
 yes — the DPC is considered a Home SMSC
 no — the DPC is not considered a Home SMSC

Default: No change to the current value

:ncai= (optional)

Nested cluster allowed indicator. Specifies whether the route to the cluster point code can be different for provisioned members of the cluster. A point code is a member of a cluster point code if it has the same network identifier (NI) and network cluster (NC) values as the cluster point code. This parameter can only be specified for cluster point codes. Nested cluster routing is allowed if this parameter is set to **yes** and the CRMD and NCR features are turned on.

Range: **yes, no**
 yes — The cluster point code is a nested cluster point code. Point codes that are members of this cluster point code can be assigned to route sets that are different from the route set assigned to the cluster point code.
 no — The cluster point code is not a nested cluster point code. Point codes that are members of this cluster point code must be assigned to the same route set assigned to the cluster point code.

Default: Current value.

:nprst= (optional)

NM bits reset. This parameter specifies whether the NM bits should be set to **00**.

This parameter applies only to ITU IAM messages. The **nptype=nm** parameter must be specified (see the **chg-tifo** command) before this parameter can be specified.

Range: **off, on**
 off — Do not set NM Bits to 00 in ITU IAM message if TIFOPTS **nptype** option value is **nm**
 on — Set NM Bits to 00 in ITU IAM message if TIFOPTS **nptype** option value is **nm**

Default: No change to the current value

:prx= (optional)

Proxy point code indicator. This parameter specifies whether a destination point code is used as a proxy point code.

Range: **yes, no**

yes— The destination point code is used as a proxy point code.

no— The destination point code is not used as a proxy point code.

Default: No change in current value.

:rcause= (optional)

Release cause. This parameter specifies the value to be used as the release cause on REL messages. If the TIFOPTS **rlcopc** parameter is specified (see the **chg-tifo** command), and a value of **0-127** is specified for the **rcause** parameter, then the **rcause** parameter value overrides the values specified for the TIFOPTS **rcausenp** and **rcausepfx** parameters.

Range: **0-127, none**

none—use the values specified for the TIFOPTS **rcausenp** and **rcausepfx** parameters

Default: No change to the current value

:sccpmsgenv= (optional)

SCCP UDT(S)/XUDT(S) Message Conversion Indicator. This parameter specifies the type of conversion performed on messages for the specified destination.

Range: **none, udt2xudt, xudt2udt, sxudt2udt**

none— conversion is not required on messages for the destination

udt2xudt— convert all UDT(S) messages for the destination to XUDT(S) messages

xudt2udt— convert all non-segmented XUDT(S) messages for the destination to UDT(S) messages

sxudt2udt— convert all segmented and non-segmented XUDT(S) messages for the destination to UDT(S) messages

Default: No change to the current value

:spc= (optional)

ANSI secondary point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **spca**

Range: **p-, 000-255, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid for *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

Enter **none** to delete the point code.

The point code **000-000-000** is not a valid point code.

Default: No change to current value

:spc/spca/spci/spcn/spcn24= (optional)

Secondary point code.

:spci= (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

Enter **none** to delete the point code.

Default: No change to current value

:spcn= (optional)

ITU national secondary point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

Enter **none** to delete the point code.

Default: No change to current value

:spcn24= (optional)

24-bit ITU national secondary point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Enter **none** to delete the point code.

Default: No change to current value

:splitiam= (optional)

This parameter specifies when and how to split an ITU IAM message into 1 IAM message + 1 SAM message.

This parameter applies only to ITU IAM messages.

Range: **15-31, none**

15-31—Maximum number of CdPN digits allowed in the IAM message before splitting occurs. The remaining digits, up to a total of 32, are encoded in the SAM message.

none—use the value specified for the TIFOPTS **splitiam** parameter to determine when to split the IAM message

Default: No change to the current value

Example

To change the clli of destination 111-222-111 to rlghncxa01a:

chg-dstn:dpc=111-222-111:clli=rlghncxa01a

To change the exception-list exclusion indicator for cluster 20-2-* to yes:

chg-dstn:dpc=20-2-*:elei=yes

To change an existing destination to contain an SPC:

chg-dstn:dpc=20-2-2:spc=5-5-5

To change Nested Cluster Allowed Indicator for cluster 20-2-* to yes:

chg-dstn:dpc=20-2-*:ncai=yes

To change a network destination:

chg-dstn:dpc=25-*-*:clli=tklc

To change the bei parameter value of ITU national destination 8111-aa to yes:

chg-dstn:dpcn=8111-aa:bei=yes

To change the bei parameter value of 24-bit ITU-N destination 15-100-10 to yes:

chg-dstn:dpcn24=15-100-10:bei=yes

To change an existing 24-bit ITU-N destination to contain a 24-bit ITU-N SPC:

chg-dstn:dpcn24=12-12-12:spcn24=25-25-25

To change ITU-I spare destination point code s-2-100-1 to contain an ITU-I spare secondary point code, ANSI alias, and ITU-N spare alias:

chg-dstn:dpci=s-2-100-1:spci=s-2-129-9:aliasa=121-120-120:aliasn=s-129

To prevent a destination point code from being used as a proxy point code:

chg-dstn:dpc=11-11-11:prx=no

To change ITU-N destination point code 10805-nz to delete its ANSI alias and add both ITU-I spare and non-spare aliases:

chg-dstn:dpcn=10805-nz:aliasa=none:aliasi=s-5-80-0,5-80-1

To change ITU-I spare destination point code s-5-60-3 to add ITU-N non-spare and spare aliases:

chg-dstn:dpci=s-5-60-3:aliasn=10723-gr,s-10723-gr

To change ITU-I spare destination point code s-5-60-5 to add ITU-N spare and ITU-I non-spare aliases:

chg-dstn:dpci=s-5-60-5:aliasn=s-10725-gr:aliasi=5-60-5

To change sccpmsgcnv type to udt2xudt for destination 11-11-11:

chg-dstn:dpc=11-11-11:sccpmsgcnv=udt2xudt

Dependencies

NOTE: A *full point code* contains numerical values for all three segments of the point code.

At least one optional parameter must be specified.

The specified destination point code value must already be defined in the Destination point code table.

The destination address must be a full point code, a network destination, or a cluster point code.

The ANSI self-ID destination point code for the STP must be defined before ANSI destinations can be changed.

The ITU-I self-ID destination point code for the STP must be defined before ITU-I destinations can be changed.

The ITU-N self-ID destination point code for the STP must be defined before ITU-N destinations can be changed.

The Spare Point Code Support feature must be enabled before the spare point code prefix **s-** can be specified for an ITU-I or ITU-N destination, secondary, or alias point code.

If the **dpcn** or **aliasn** parameter is specified, the format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

If the 7000 Routesets or 8000 Routesets feature is enabled, then the total number of provisioned aliases in the system cannot exceed 8000. If the 10,000 Routesets feature is enabled, then the total number of provisioned aliases in the system cannot exceed 10000.

Alias point codes are allowed only for full point code destinations.

Alias point codes for destinations must be full point codes.

A specified alias type cannot already be defined as a destination address. The **aliasa** and **dpca** parameters cannot be specified together in the command. The **aliasi** and **dpci** parameters and the **aliasn** and **dpcn** parameters cannot be specified together in the command if the *prefix* subfields are the same (both are spare or both are non-spare).

Alias ANSI point codes cannot be members of a cluster or network destination.

The specified alias network type must be different from the destination point code network type.

A 24-bit ITU-N point code cannot have a 14-bit ITU-N alias point code or an ANSI alias point code.

A 24-bit ITU-National point code can have an ITU-I point code alias. This allows conversion of 14-bit ITU-I routing label to 24-bit routing label and vice versa.

A 14-bit ITU-N point code cannot have a 24-bit ITU-N alias point code.

If an ITU-I point code is specified, either the **aliasn** or the **aliasn24** parameter can be specified, but not both.

Cluster destinations are allowed only if the CRMD feature is turned on.

The **ncai** parameter can be specified only for cluster destinations.

The **elei** parameter can be specified only for cluster destinations (for example, **dpc=ni-nc-***).

The NCR (Nested Cluster Routing) feature must be turned on before the **ncai** parameter can be specified.

Network routing is valid only if the Network Routing (NRT) feature is turned on.

When using network routing, if the destination point code has a value of * in the *nc* subfield, the *ncm* subfield must also be * (for example, **dpc=21-*-***).

If a provisioned nested cluster point code is being changed to a non-nested cluster point code (**ncai=no**), previously provisioned members of the cluster must have the same route set.

If a provisioned non-nested cluster point code is being changed to a nested cluster point code (**ncai=yes**), the maximum number of provisioned nested clusters must be no greater than 500.

If specified, the **spc** parameter value must already be configured as a secondary point code in the Secondary Point Code table.

The value specified for the **spc** parameter must be a full point code.

If the **spc** parameter is specified, the **domain=ss7** parameter must be specified.

If the **spc** parameter is specified, then the value specified for the **dpc** parameter must be a full point code.

The network type of the value specified for the **spc** parameter must match the network type of the value specified for the **dpc** parameter.

If a new **clli** for the destination point code is specified, it cannot match the **clli** of the system.

If the corresponding destination for the specified destination point code is an adjacent signaling point (matched a Far End point code in its linkset entity set), the **clli** of the specified destination point code cannot be assigned to any other destination address.

A reserved word cannot be specified for the destination identifier (**clli**).

If the destination does *not* use an SPC, the group code of the destination must be the same as the group code of the ITU national true point code. If the destination uses an SPC, then the group code of the destination must match the group code of the SPC.

If an ITU national destination is being changed and the ITUDUPPC feature is turned on, this applies depending on whether the destination uses an SPC (secondary point code). For example, if the ITU national true point code has a group code of **ee**, then destinations with group codes of **ee** can be added without using an SPC. Destinations with a group code of **ff**, however, must use an SPC with a group code of **ff**.

ICNP feature must be enabled and turned on in order to specify the **icnpxlat**, **cgpafmt**, and **cdpafmt** parameters.

Alias point codes cannot already be defined as another destination.

The value specified for the **spc** parameter cannot already be specified as a secondary point code for the destination point code.

The Proxy Point Code feature must be enabled before the **prx** parameter can be specified.

If the **prx=yes** parameter is specified, then the value of the **dpc** parameter must be a full point code.

If the value of the **dpc** parameter is used as a proxy point code, then the **prx=no** parameter cannot be specified.

The number of proxy destinations cannot exceed the value allowed by the enabled Proxy Point Code quantity feature.

If the **prx=yes** parameter is specified, then the **spc/spca/spci/spcn/spcn24** parameter cannot be specified.

If the value specified for the **dpc** parameter is a private point code, then the **prx=yes** parameter cannot be specified.

The total number of proxy destinations cannot exceed the total capacity (100) of the Proxy Point Code feature.

If an IPGW linkset is used, then the **prx=yes** parameter cannot be specified.

The network type of the routeset must be the same as the network type of the destination point code. For example, a destination point code with an ANSI network type cannot use a routeset with an ITU network type.

If the specified destination point code is assigned a proxy point code (PPC) in the DSTN table, then the specified routeset must contain a linkset for the destination point code, and the PPC of the linkset must be equal to the PPC of the destination point code.

The value specified for the **spc** parameter must differ from the secondary point code of the destination/route entry specified by the **dpc** parameter.

The value specified for the **ncai** parameter cannot be same as the NCAI that is already assigned to the destination point code.

If the specified destination point code is a cluster or network destination point code, then the specified routeset cannot contain a route over proxy linksets.

If the destination point code and adjacent point code of the routes in the specified routeset are ITU point codes, then the following conditions must apply.

- If one point code is an ITUI point code, and the other is a ITUN or ITUN24 point code, then the network type of the secondary adjacent point code must match the network type of the destination point code.
- If both point codes have the same network type, then either both must be spare point codes or both must not be spare point codes.
- If the destination point code is a ITUN point code, and the ITUDUPC feature is turned on, then the group code of the destination point code must match the adjacent or the secondary adjacent point code.

A maximum of two aliases can be specified per destination.

If the **dpci** parameter is specified, then a combination of ITUI and ANSI aliases cannot be specified. If the **dpcn** parameter is specified, then a combination of ITUN and ANSI aliases cannot be specified.

Two ITUI or two ITUN aliases can be specified for the same destination point code only if the aliases have different prefixes. One alias must be spare and one non-spare.

The TIF Number Portability feature must be enabled before the **rcause** or **nprst** parameter can be specified.

A TIF feature must be enabled before the **splitiam** parameter can be specified.

The XUDT UDT Conversion feature must be turned on before the **sccpmsgcnv** parameter can be specified.

Notes

The **domain** parameter of a destination (see the **ent-dstn** command) cannot be changed with this command. To change the **domain** parameter, the destination must be removed with the **dlt-dstn** command and re-entered with the **ent-dstn** command.

In this command, only ITU-international and ITU national point codes and aliases support the spare point code subtype prefix (**s-**). Only ITU-international and ITU national point codes support the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**). Aliases do not support the private (internal) point code prefix.

The value specified for the **dpc** parameter must be a full point code in order to be used as a proxy point code. Cluster point codes and private point codes cannot be used as proxy point codes.

Invalid usage of **none** with **aliasi** and **aliasn**:

- **alias=none,none** parser code expects **none** to be the last argument
- **alias=none,pointcode** parser code expects **none** to be the last argument
- **alias=,pointcode** invalid usage of command separator

Legend:

0—clear alias if provisioned regardless of its pointcode type

0A—clear alias if provisioned and pointcode is ANSI

0I—clear alias if provisioned and pointcode is ITUI

0N—clear alias if provisioned and pointcode is ITUN

0A,I—clear alias if provisioned and pointcode is ANSI or ITUI

0A,N—clear alias if provisioned and pointcode is ANSI or ITUN

0I,N—clear alias if provisioned and pointcode is ITUI or ITUN

0A,I,N—clear alias if provisioned and pointcode is ANSI or ITUI or ITUN

Output

The following example shows the display of the destination memory space accounting command completion response with the NCR, NRT, and CRMD features off (disabled) and all Routes and Routesets features off (disabled):

```
chg-dstn:dpca=111-222-111:aliasn=321
rlghncxa03w 04-08-17 15:35:05 EST EAGLE 31.8.0
Destination table is (10 of 2000) 1% full
Destination table is (10 of 2000) 1% full
Alias table is (8 of 12000) 1% full
CHG-DSTN: MASP A - COMPLTD
```

;

The following example shows the display of the destination memory space accounting command completion response with the NCR, NRT, and CRMD features off (disabled) and the 5000 Routes feature on:

```
chg-dstn:dpca=111-222-111:aliasn=321

chg-e1

Change E1 Interface

Use this command to change an interface for an E1 card in the system. An E1 card can consist of an E1/T1 MIM card or an HC-MIM or E5-E1T1 card used as an E1 or SE-HSL card.

On HC-MIM and E5-E1T1 cards E1 ports 1, 3, 5, and 7 (master ports) can be independently channel bridged with their adjacent even-numbered E1 ports 2, 4, 6, and 8 (slave ports) to allow non-signaling data pass-through.

Keyword: **chg-e1**

Related Commands: **dlt-e1, ent-e1, rtrv-e1, tst-e1**

Command Class: Database Administration

Parameters

:e1port= (mandatory)

E1 port number. The value must be an E1 port that has already been configured with an E1 interface on the specified E1 card.

Range: **1- 8**

Ports 3 - 8 can be specified only for HC-MIM and E5-E1T1 cards.

Any 2 of the 8 ports on an HC-MIM card can be specified when the card is used as an SE-HSL card.

Any 1 of the 8 ports on an E5-E1T1 card can be specified when the card is used as an SE-HSL card.

:loc= (mandatory)

Card address. The card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

:cas= (optional)

CAS (**on**) or CCS (**off**) indicator.

Range: **on, off**

CAS cannot be specified for HC-MIM or E5-E1T1 cards.

Default: No change to the current value

:chanbrdg= (optional)

Port bridging status. This parameter specifies whether an odd-numbered E1 port on an HC-MIM or E5-E1T1 card is channel bridged with its adjacent even-numbered E1 port for non-signaling data pass through.

Range: **on, off**

Default: No change to the current value

:crc4= (optional)

CRC4 enable or disable indicator.

Range: **on, off**

Default: No change in current value

:e1tsel= (optional)

Timing source.

Range: **line, external, recovered**

line — slave timing source

external — master timing source

recovered — timing source recovered from the paired master port for channel bridged slave ports

Default: No change to the current value

:encode= (optional)

Indicator for use of HDB3 or AMI encoding/decoding.

Range: **hdb3, ami**

AMI encoding is supported for the E1/T1 MIM card, or an HC-MIM or E5-E1T1 card used as an E1 card.

Default: No change to the current value

:force= (optional)

This parameter specifies to provision an odd-numbered E1 port to channel bridging mode if the adjacent next higher even-numbered port is already provisioned with an E1 interface.

Range: **yes, no**

:minsurate= (optional)

Minimum signal unit rate. This parameter indicates the minimum number of SUs present on a link that are uniformly distributed. This parameter is valid only when the **linkclass=unchan** parameter is specified in the E1 interface.

Range: **500-2000**

Default: No change to the current value

:si= (optional)

Value of two Spare International bits of NFAS data.

Range: **0-3**

Default: No change in current value

:sn= (optional)

Value of five Spare International bits of NFAS data.

Range: **0-31**

Default: No change in current value

Example

```
chg-
e1:loc=1205:e1port=1:crc4=off:cas=on:encode=hdb3:e1tsel=external:
si=2:sn=12
chg-e1:loc=1205:e1port=2:cas=off:encode=ami
chg-e1:loc=1205:e1port=3:chanbrdg=on:e1tsel=recovered
chg-e1:loc=1205:e1port=1:minsrate=1000
```

Dependencies

At least one optional parameter must be specified.

The specified card location (**loc** parameter) must be equipped.

The card specified by the **loc** parameter must be a **lime1** card type.

The port specified by the **e1port** parameter must already be equipped with an E1 interface.

If the value specified for the **loc** parameter indicates an E1 card, then all signaling links that are serviced by the card must be deactivated (see the **dlt-slk** command) before the values for the **crc4**, **cas**, **encode**, and **e1tsel** parameters can be changed.

The **cas=on** parameter cannot be specified when timeslot 16 on the E1 card is being used by a signaling link.

The **cas=on** parameter cannot be specified if:

- A value of **3 - 8** is specified for the **e1port** parameter
- The **chanbrdg=on** parameter is specified
- The value specified for the **loc** parameter indicates an HC-MIM or E5-E1T1 card

The **encode=ami** parameter is supported only for an E1/T1 MIM, HC-MIM, or E5-E1T1 card used as an E1 card.

The **chanbrdg** parameter can be specified only for HC-MIM or E5-E1T1 cards that are used as E1 cards (not as SE-HSL cards).

The **chanbrdg=on** parameter cannot be specified for even-numbered E1 ports on HC-MIM or E5-E1T1 cards.

The timing source parameter **e1tsel** must be specified if **chanbrdg=on** is specified.

If the **chanbrdg=on** parameter is specified for an E1 port on an HC-MIM or E5-E1T1 card, then the **e1tsel=line** parameter cannot be specified.

The **chanbrdg=on** parameter must be specified for an HC-MIM or E5-E1T1 card before the **e1tsel=recovered** parameter can be specified. If the **e1tsel=recovered** parameter was specified previously, then the **e1tsel=line** parameter must be specified before the **chanbrdg=off** parameter can be specified.

The **force=yes** parameter must be specified before the **chanbrdg=on** parameter can be specified for an odd-numbered E1 port on an HC-MIM or E5-E1T1 card if the adjacent next higher even-numbered port is already provisioned with an E1 interface.

The **linkclass=unchan** parameter must be specified before the **minsurate** parameter can be specified. If the **linkclass=unchan** parameter is specified, then the **chanbrdg=on** and the **cas=on** parameters cannot be specified.

Before the **chanbrdg=on** parameter can be specified for an odd-numbered E1 port on an HC-MIM or E5-E1T1 card, all signaling links assigned to its next higher even-numbered adjacent E1 port must be deleted (see the **dlt-slk** command).

Parameter values cannot be changed for the even-numbered E1 port interface (**e1port** parameter) in a channel bridged pair. The values must be changed in the odd-numbered port interface.

HIPR cards must be equipped in card locations xy09 and xy10 (x is the frame, y is the shelf) on each EAGLE 5 ISS shelf that contains one or more HC-MIM or E5-E1T1 cards.

The **fan** feature bit (see the **chg-feat** command) must be turned on before HC-MIM cards can be used in an EAGLE 5 ISS shelf.

If the value specified by the **loc** parameter refers to a Channel card, then the **chanbrdg=on** parameter cannot be specified.

Card locations 1113, 1114, 1115, 1116, 1117, 1118 (OAM, TDM, MDAL cards) cannot be specified as values for the **loc** parameter.

Locations xy09 and xy10, where x is the shelf and y is the slot, cannot be specified as values for the **loc** parameter.

Notes

When **e1tsel=external** is specified, a user-supplied BITS clock is required.

External timing is derived from the EAGLE 5 ISS High-Speed Master Clock (1.544 MHz for T1 or 2.048 MHz for E1); therefore, the Master Timing feature is required. Line timing is derived from its received data stream, if present.

Output

```
chg-e1:loc=1205:e1port=2:cas=off:encode=ami
```

```
rlghncxa03w 04-01-20 09:07:58 EST EAGLE 31.3.0

chg-eisopts

Change Eagle Support for Integrated Sentinel Options

Use this command to enable and disable the copy functions that are associated with the EAGLE 5 Integrated Monitoring Support (E5IS) feature.

Keyword: chg-eisopts
Related Commands: rtrv-eisopts
Command Class: Security Administration

Parameters

:eiscopy= (optional)

System-wide control for MSU, alarm, and event copy to the ESP.

Range: on, off

Default: No change to the current value

System

Default: off

:fcgpl= (optional)

This parameter applies the functionality specified by the **fcmode** parameter to cards running the specified Fast Copy GPL.

Range: ipsg, ipghc, all

ipsg— apply functionality to cards running the IPSG GPL

ipghc— apply functionality to cards running the IPGHC GPL

all— apply functionality to cards running the IPSG or IPGHC GPL

Default: No change to the current value

System

Default: all

:fcmode= (optional)

This parameter specifies a system-wide control to enable or disable monitoring on FC-capable cards.

Range: stc, fcopy, off

stc— STC monitoring is performed on FC-capable cards

fcopy— FC monitoring is performed on FC-capable cards

off— Monitoring is not performed on FC-capable cards

Default: No change to the current value

System **stc** - If Integrated Monitoring is turned on for the first time, and the **eiscopy=on**

Default: parameter has been specified, then the system default for the **fcmode** parameter is **stc**. If the **eiscopy=off** parameter has been specified, then the system default value is **off**.

Example

```
chg-eisopts:eiscopy=on
```

```
chg-eisopts:fcmode=fcopy:fcgpl=all
```

Dependencies

At least one parameter must be specified.

The E5IS feature must be turned on before this command can be entered

Before the E5IS copy function can be enabled, at least 2 STC cards must be installed and in the IS-NR state in the system.

The **eiscopy=on** parameter must be specified before a value of **stc** or **fcopy** can be specified for the **fcmode** parameter.

The **fcmode=off** parameter must be specified before the **eiscopy=off** parameter can be specified and before the value of the **fcmode** parameter can be changed between **stc** and **fcopy**.

At least one card must be running the IPSG GPL and must be in the IS-NR state before a value of **ipsg** or **all** can be specified for the **fcgpl** parameter.

At least one card must be running the IPGHC GPL and must be in the IS-NR state before a value of **ipghc** or **all** can be specified for the **fcgpl** parameter.

If the **fcgpl** parameter is specified, then the **fcmode** parameter must be specified.

The host portion of the PVN network address must be **0** based on the PVN subnet mask (see the **chg-netopts** command) before the **eiscopy=on** parameter can be specified.

The destination of a static IP route (see the **ent-ip-rte** command) and the local interface network address of an IP card (see the **ent-ip-host** command) must be different from the PVN, FCNA, and FCNB network addresses (see the **chg-ip-lnk** command) before the **eiscopy=on** parameter can be specified.

If the same value is specified for the PVN, FCNA, or FCNB network addresses (see the **chg-netopts** command), then the **eiscopy=on** parameter cannot be specified.

Notes

Fast Copy Cards

E5-ENET or E5-ENET-B cards running the IPSG or IPGHC GPL are considered to be *FC-capable*. A card running the IPGHC GPL must be in the IS-NR State before the card can be considered *FC-capable*. This restriction does not apply to cards running the IPSG GPL. An *FC-capable* card is considered *FC-enabled* when Fast Copy monitoring is enabled for the respective GPL.

Output

```
chg-eisopts: fcmode=fcopy: fcgpl=all
rlghncxa03w 10-02-02 09:08:58 EST EAGLE 42.0.0
CHG-EISOPTS: MASP A - COMPLTD
```

chg-feat

Change Feature

Use this command to activate the optional features available on the system.

You must purchase a feature before you turn the feature on. If you are not sure whether you have purchased a feature, contact your Tekelec Sales Representative or Account Representative.

CAUTION

CAUTION: The features are off when the system is installed. A feature that is turned on with this command cannot be turned off.

Keyword: chg-feat

Related Commands: rtrv-feat

Command Class: Database Administration

Parameters

NOTE: As of Release 42.0 the seas parameter is obsolete.

:cncf= (optional)

This parameter turns on the Calling Name Conversion Facility (CNCF) feature.

Range: on

System

Default: off

:crmd= (optional)

This parameter turns on the Cluster Routing and Management Diversity (CRMD) feature.

Range: on

System

Default: off

:dstn5000= (optional)

This parameter turns on the 5000 Routes feature.

Range: on

System

Default: off

:e5is= (optional)

This parameter turns on the EAGLE 5 Integrated Monitoring Support (E5IS) feature.

Range: on

System

Default: off

:egt= (optional)

This parameter turns on the Enhanced Global Title Translation (EGTT) feature.

Range: on

System

Default: off

:fan= (optional)

This parameter turns on the cooling fan feature.

Range: on

System

Default: off

:gtt= (optional)

This parameter turns on the Global Title Translation (GTT) feature.

Range: on

System

Default: off

:gws= (optional)

This parameter turns on the Gateway Screening (GWS) feature.

Range: on

System

Default: off

:ipisup= (optional)

This parameter turns on the ISUP Routing Over IP (IPISUP) feature.

Range: on

System

Default: off

:ituduppc= (optional)

This parameter turns on the ITU National Duplicate Point Code (ITUDUPPC) feature.

Range: on

System

Default: off

:itumtps= (optional)

This parameter turns on the ITU MTP Restart feature.

Range: on

System

Default: off

:lan= (optional)

This parameter turns on the STP LAN feature.

Range: on
System
Default: off

:lfs= (optional)

This parameter turns on the Link Fault Sectionalization (LFS) feature.

Range: on
System
Default: off

:measplat= (optional)

This parameter turns on the Measurements Platform feature. The **chg-measopts:platformenable=on** command must be entered to enable the Measurement Platform collection function (which cannot be disabled after it is enabled in the system).

Range: on
System
Default: off

:mpc= (optional)

This parameter turns on the Multiple Point Code (MPC) feature.

Range: on
System
Default: off

:mtpsr= (optional)

This parameter turns on the ANSI MTP Restart feature.

Range: on
System
Default: off

:ncr= (optional)

This parameter turns on the Nested Cluster Routing (NCR) feature.

Range: on
System
Default: off

:nrt= (optional)

This parameter turns on the Network Routing feature.

CAUTION

CAUTION: When using this feature, limited network management is provided for point codes not covered by full point code routing, Cluster Routing, or Nested Cluster Routing.

Range: on
System
Default: off

:plnp= (optional)

This parameter turns on the PCS (Personal Communication Service) 1900 Number Portability feature.

Range: on
System
Default: off

:sccpconv= (optional)

This parameter turns on the SCCP Conversion feature.

Range: on

System
Default: off

:slsob= (optional)

This parameter turns on the Other CIC (Circuit Identification Code) Bit Used feature.

Range: on

System
Default: off

:tcapcnv= (optional)

This parameter turns on the TCAP Conversion feature.

Range: on

System
Default: off

:tlnp= (optional)

This parameter turns on the Triggerless Local Number Portability (TLNP) feature.

Range: on

System
Default: off

:tcsync= (optional)

This parameter turns on the Time Slot Counter Synchronization (TSC) feature that is used with GSM-II cards. This feature is required, along with use of STC cards, for the EAGLE 5 Integrated Monitoring Support feature (**e5is=on**).

Range: on

System
Default: off

:vgtt= (optional)

This parameter turns on the Variable Length GTT (VGTT) feature.

Range: on

System
Default: off

:wnp= (optional)

This parameter turns on the Wireless Number Portability (WNP) feature.

Range: on

System
Default: off

:seas= (obsolete)

This parameter turns on the Signaling Engineering Administration System (SEAS) feature.

This parameter is obsolete.

Range: on

Default: No change in current value.

System
Default: off

Example

```
chg-feat:gtt=on
chg-feat:gws=on:cncf=on
chg-feat:sccpcnv=on:tcapcnv=on
chg-feat:tcsync=on:e5is=on
```

Dependencies

NOTE: The "LNP feature" is turned on when the LNP ported TNs quantity appears in the rtrv-ctrl-feat command output. An LNP quantity feature access key has been enabled and turned on. See the enable-ctrl-feat and chg-ctrl-feat commands for more information about turning on the LNP feature.

At least one optional parameter must be specified.

The Gateway Screening feature must be turned on before the STP LAN or CNCF feature can be turned on.

The SCCP Conversion feature must be turned on before the TCAP Conversion feature can be turned on.

The LNP feature must be turned on before the Wireless Number Portability or PCS 1900 LNP features can be turned on.

The LNP and Gateway Screening features must be turned on before the Triggerless LNP feature can be turned on.

The Cluster Routing and Management Diversity feature must be turned on before the Nested Cluster Routing feature can be turned on.

The Global Title Translation feature must be turned on before the Enhanced Global Title Translation feature can be turned on.

The Multiple Point Code feature must be turned on before the ITU National Duplicate Point Code feature can be turned on.

The Global Title Translation feature must be turned on before the Variable Length GTT feature can be turned on.

Both cards that run the OAM must be GPSM-II cards before the Time Slot Counter Synchronization feature can be turned on.

CAUTION: Never install or initialize MCAP cards in card slots 1113 and 1115 after GPSM-II cards are provisioned in these slots. Attempting to initialize MCAP cards after GPSM-II cards have been provisioned in slots 1113 and 1115 will cause a system outage. Before replacing an existing GPSM-II card in slot 1113 or 1115, contact Tekelec Customer Service.

The Time Slot Counter Synchronization feature must be turned on before the EAGLE 5 Integrated Monitoring Support feature can be turned on. These parameters can be specified together in the command to turn them both on at the same time.

If the ANSI/ITU SCCP Conversion feature is enabled, then the SCCP and TCAP conversion features cannot be turned on.

The Gateway Screening feature must be turned on before the Calling Number Conversion Facility feature can be turned on.

The Global Title Translation feature must be turned on before Global System for Mobile Screening feature can be enabled.

Notes

This command is not allowed in upgrade mode.

After a feature bit is turned on, it cannot be turned off. Take care in turning on features that are not used in the network configuration.

The Calling Name Conversion Facility (CNCF) feature provides a conversion of ISUP IAM messages. The facility uses the following two versions of calling name identification presentation (CNIP) for calling name information delivery:

- The nonstandard, proprietary ISUP party information (PIP) parameter.
- The ANSI standard ISUP generic name (GN) parameter.

The conversion either replaces the PIP parameter with the GN parameter or the GN parameter with the PIP parameter in the ISUP IAM message. The user can set up GWS screens to apply the CNCF feature on a per-point-code or range-of-point-code basis.

The Cluster Routing and Management Diversity (CRMD) feature allows the system to configure one route set to an entire cluster of destinations, thus enabling the system to manage and switch traffic to more end nodes.

The Global Title Translation (GTT) feature allows the system to provide translation of the global title digits located in the called party address of an SCCP message. The translation consists of a point code and subsystem number. This feature requires Service Module cards loaded with the VSCCP application.

The Enhanced Global Title Translation (EGTT) feature provides enhancements to the way the system performs GTT for both ITU and ANSI messages. The feature allows the combination of domain (ANSI or ITU), global title indicator (GTI), translation type (TT), numbering plan (NP), and nature of address indicator (NAI) selectors to be used to select a translation table when the system receives a message requiring EGTT. The feature also allows inclusion of the translated subsystem number (SSN) in the called party address (CDPA) and inclusion of the originating point code (OPC) in the calling party address (CGPA). The feature also provides deletion capability of the GT (global title) in the CDPA.

The Gateway Screening (GWS) feature allows the system to screen specific message types with selected parameters from entering the network through this STP. This feature requires TSM/E5-TSM cards loaded with the GLS application or E5-OAM cards (if the Integrated GLS feature is turned ON).

The STP LAN feature allows selected SS7 messages to be copied and sent to a remote host over an ethernet LAN using the TCP/IP protocol. This feature requires up to 32 cards running the **stplan** application, and requires the Gateway Screening feature.

The Triggerless LNP (TLNP) feature gives service providers a method to route calls to ported numbers without having to upgrade their signaling switch (end office or mobile switching center) software. This feature uses the gateway screening stop action TLNP to intercept through-switched ISUP messages on the LIM.

The Link Fault Sectionalization (LFS) feature allows the system to perform a series of far end loopback tests that identify faulty segments of an SS7 transmission path up to and including the remote network element.

The ANSI MTP Restart (MTPRS) feature provides an orderly process for bringing signaling links back into service after the system has been isolated and restarted. A greater preference is given to restoring the STP to network service in an orderly fashion than to the speed of recovery. The time required is system dependent as shown:

- Up to 64 LIMs—62 seconds (Link Alignment Delay)
- 64 - 127 LIMs—97 seconds
- 128-191 LIMs—132 seconds
- More than 191 LIMs—167 seconds

The ITU MTP Restart (ITUMTPRS) feature provides MTP restart support for ITU networks and extends the system's ANSI MTP restart support to mixed ITU and ANSI networks. The performance of ITU MTP Restart is comparable to the performance of ANSI MTP Restart.

The SCCP and TCAP conversion features (SCCPCNV and TCAPCNV) allow the system to convert MTP-routed SCCP and TCAP messages from ANSI to ITU format and to convert ITU formatted messages to ANSI.

The PCS 1900 LNP (PLNP) feature provides for LNP query/response in a PCS wireless environment using the LRN method to support Service Provider Number Portability.

The Nested Cluster Routing (NCR) feature allows the system to support full point code entries on different routes within a cluster.

The Other CIC (Circuit Identification Code) Bit Used feature is one of two methods provided as ITU SLS enhancements for distributing the load across links in a combined and single linkset. The Other CIC Bit Used feature lets the system derive the LSB (Least Significant Bit) from bits 2 through 4 of the CIC to serve as the three lower bits of the SLS (Signaling Link Selection) and one other bit of the CIC to serve as the MSB (Most Significant Bit) of the SLS. The SLSOCB feature applies only to ITU-ISUP messages. The other method of distributing the load is rotation of the four bits of the SLS to change the LSB of the SLS. For additional information on bit rotation, see the **ent-ls** command.

The Network Routing (NR) feature allows provisioning of a single routeset to be used for all MSUs destined to members of that network.

The DSTN5000 (5000 Routes) feature provides the ability to administer up to 5000 routes on the system. If **dstn5000=on**, the values of the **mtpdpcq** (destination point code) and **mtpxlq** (exception list entries) parameters of the **chg-stpopts** command can total **5500**. Otherwise, the sum total for **mtpdpcq** and **mtpxlq** cannot exceed **2500**. The Cluster Routing and Management Diversity (CRMD) feature must be turned on before the **mtpxlq** parameter can be specified.

The MPC (Multiple Point Code) feature enables the user to use SPCs (secondary point codes) in addition to the true point codes that the EAGLE 5 ISS uses. The SPCs are used for provisioning and routing as if they were the true point code of the EAGLE 5 ISS. SPCs can be provisioned in any of the three domains (ANSI, ITU-N, and ITU-I). SPCs are supported for any type of link.

The ITUDUPPC (ITU National Duplicate Point Code) feature allows an EAGLE 5 ISS mated pair to route traffic for two or more countries that may have overlapping point code values.

The VGTT (Variable Length GTT) feature provides the ability to provision global title entries of varying lengths to a single translation type or GTT set. Users are able to assign global title entries of up to 10 different lengths to a single translation type or GTT set.

The Time Slot Counter Synchronization (TSCSYNC) feature allows the system's A (Active) and B (Standby) internal clocks to be synchronized by the GPSM-II card that is running the standby OAM.

The EAGLE 5 Integrated Monitoring Support feature provides an Ethernet interface between the EAGLE 5 ISS and the Sentinel Extended Services Platform (ESP) or the Integrated Message Feeder (IMF), to eliminate the need for cabling between each SS7 link and the ESP or IMF to monitor SS7 traffic.

The Measurements Platform feature provides a dedicated processor for collecting and reporting STP, LNP, INP, G-Flex, and G-Port Measurements data, with support for EAGLE 5 ISS growth to more than 700 links.

Output**chg-feat:gtt=on**

CHG-FEAT: MASP A - COMPLD
;

```

chg-frm-pwr**chg-frm-pwr**

Use this command to change the power threshold value in the Frame Power Threshold table for a specified frame.

The entries in the Frame Power Threshold table contain a Frame ID and the corresponding power threshold value.

Use the following commands to display the threshold and calculated maximum power consumption for the frames in the system.

- The **rtrv-frm-pwr** command displays the current provisioned frame power threshold for each provisioned frame.
- The **rtrv-stp:display=power** command displays the provisioned frame power threshold for each provisioned frame, and displays the maximum calculated power consumption for each frame, based on card population.
- The **rtrv-stp:display=power:frm=xxxx** command displays the provisioned frame power threshold for the specified frame, the maximum calculated power consumption for the frame based on card population, and the maximum power consumption for each card in the frame and for a fan assembly for each shelf.

NOTE: The frame-level power threshold value needs to be determined from the capacity in Amps of the fuse alarm panel (FAP) for the frame. Contact your site engineer to determine the FAP capacity.

Keyword: chg-frm-pwr

Related Commands: dlt-frm-pwr, ent-frm-pwr, rtrv-frm-pwr, rtrv-stp

Command Class: Database Administration

Parameters

:frm= (mandatory)

Frame ID

Range: cf00, ef00, ef01, ef02, ef03, ef04

cf00— Control frame

ef00— First extension frame

ef01— Second extension frame

ef02— Third extension frame

ef03— Fourth extension frame

ef04— Fifth extension frame

:thrshld= (mandatory)

Threshold. This parameter specifies the frame-level power threshold, in Amps. This value is compared with the current calculated maximum power consumption for the frame (use the **rtrv-stp:display=power:frm=** command to obtain the maximum power consumption value), and the appropriate alarms are raised if that power consumption exceeds the threshold limit.

The value of the **thrshld** parameter needs to be determined from the capacity of the fuse alarm panel (FAP) for the frame. Contact your site engineer to determine the frame FAP capacity.

Range: 30-65
Default: 30

Example

Change the frame power threshold value for the first extension frame.

```
chg-frm-pwr:frm=ef00:thrshld=58
```

Dependencies

A power threshold value must already be provisioned for the specified frame.

Notes

The maximum calculated power for a frame is based on the cards that are populated in the system, and includes a fan tray assembly for every shelf (the system cannot detect the presence or absence of a fan tray, and assumes presence for the calculation). These values are typically much higher than the actual power being drawn; the values cannot be used as a gauge of the actual power consumption of the EAGLE 5 ISS.

Output

```
chg-frm-pwr:frm=ef00:thrshld=58
tekelecstp 06-06-01 15:18:41 EST EAGLE 35.0.0
FRAME POWER THRESHOLD table is (4 of 10) 40% full
CHG-FRM-PWR: MASP A - COMPLTD
;
```

chg-ftp-serv

Change FTP Server Entry

Use this command to change an entry for an FTP server in the FTP Server table.

CAUTION: Contact the Customer Care Center before specifying the user parameter value. The FTP-based Table Retrieve Application (FTRA) sends the necessary FTP Server information to the system, and the system overwrites any entry that is already in the FTP Server table for that server.

Keyword: chg-ftp-serv

Related Commands: dlt-ftp-serv, ent-ftp-serv, rtrv-ftp-serv

Command Class: Database Administration

Parameters

:app= (mandatory)

Application. This parameter specifies the FTP Client application that interfaces with the FTP server.

Range: meas, user, db, dist

meas — Measurements Platform application

user — FTP-based Table Retrieve Application (FTRA)

db — Database Backup\Restore application

dist — EAGLE 5 ISS Software Release Distribution application

:ipaddr= (mandatory)

IP Address of the FTP Server.

Range: 4 numbers separated by dots, with each number in the range of 0-255.

:login= (optional)

FTP Server Username (A prompt for entering a password appears on a separate line.)

Range: ????????????????

1 to 15 alphanumeric characters; mixed-case is allowed

:path= (optional)

FTP path used to locate the file that will be sent.

Range: `////////////////////////////////////
////////////////////////////////////`

Up to 100 characters; mixed-case string in double quotes with valid FTP path format

Default: User's home directory

:prio= (optional)

Priority of this FTP server when there is more than one FTP Server for this application.

Range: **1 - 10**

Example

```
chg-ftp-
```

```
serv:app=meas:ipaddr=1.255.0.102:login=ftpmeas1:path="~meas":prio=1
```

```
chg-ftp-serv:app=user:ipaddr=1.255.0.102:login=tekperson1:path="~\data":prio=1
```

Dependencies

At least one optional parameter must be specified.

The **app** parameter must specify an application that uses the FTP Support feature.

The **ipaddr** parameter must specify a valid IP address for the FTP server.

The **path** parameter value must be in a valid FTP path format.

The **prio** parameter specifies a priority for use of an FTP server by an application when the application has more than one FTP server defined in the table. Each FTP server defined for use by the application must have a priority from 1 to 10 assigned. The available FTP server with the highest priority (smallest number) will be used first by the application.

If the **login** parameter is specified, a separate prompt appears for entry of the FTP server password. You must enter a password that is at least 1 and not more than 15 characters long. If an invalid password is entered or the Return key is pressed without entering a password, the entire command must be entered again to cause the password prompt to appear again. The password is not displayed as it is entered.

An entry for the specified application ID at the specified priority cannot already exist.

The FTP server entry to be changed with this command must already exist in the FTP Server table for the specified IP address and application.

Notes

The same FTP server can be defined more than once, but the specified application must be different for each entry.

Output

```

chg-ftp-serv:app=meas:ipaddr=1.255.0.102:path="-ftpmeas1"

chg-gpl**Change Generic Program Load**

Use this command to copy a generic program load from the system removable cartridge or drive to the destination active and standby system disks as a "trial" version. The system release identification file is uploaded from the system removable cartridge or drive to the active and standby fixed drives along with each GPL. This command also provides a parameter to turn GPL auditing "on" and "off".

Keyword: **chg-gpl**

Related Commands: **act-gpl, alw-card, copy-gpl, init-card, init-sys, rept-stat-gpl, rtrv-gpl**

Command Class: Program Update

Parameters

NOTE: As of Release 43.0, the **BLBEPM, BLBIOS, BLBSMG, BLCPLD, BLDIAG6, BLROM1, BLVXW6, IMTPCI, and PLDPMC1** GPLs are replaced with the **BLIXP GPL**. The replaced GPLs are used only during upgrade to Release 43 and hardware replacement.

:audit= (optional)

This parameter specifies whether the active MASP system release running version is to be audited every 90 seconds. The audit state is preserved through a system restart or power up.

NOTE: When audit is turned off, the system release audit process is stopped. The detection, marking, and reporting of corrupt GPLs is continuous and not affected by turning audit off.

Range: on, off

Default: on

:gpl= (optional)

Generic program load. This parameter specifies the name of the GPL identifier to be moved from "trial" to "approved" status on cartridge or drive to the disk.

Range: xxxxxxxx

1 alphabetic character followed by up to 7 alphanumeric characters. Valid GPLs are:

atmansi—Used by LIM cards to support the high-speed ATM signaling link feature

atmhc—Used by E5-ATM and E5-ATM-B cards to allow the card to support up to 3 signaling links

atmitu—Used by E1 ATM cards to support the high-speed E1 ATM signaling link feature

blbepm—Flash GPL containing the BIOS ROM image on E5-E1T1, E5-ENET, and E5-ENET-B cards

blbios—Flash GPL containing the BIOS ROM image on HC-MIM cards that are used for E1 or T1 signaling links

blbsmg—Flash GPL containing the BIOS ROM image on E5-SM4G cards

blcpld—Flash GPL containing the bit files for the CPLD on HC-MIM, E5-E1T1, E5-ENET, and E5-ENET-B cards that are used for E1 or T1 signaling links

bldiag6—Flash GPL containing the diagnostic code on E5-E1T1, HC-MIM, E5-ENET, and E5-ENET-B cards

blixp—Flash GPL containing a tar image with all code required on E5-E1T1, HC-MIM, E5-ENET, and E5-SM4G cards

blmcap—Flash GPL containing a tar image with all code required on E5-MCAP, E5-ATM-B, E5-ENET-B, E5-MCPM-B and E5-SM8G-B cards

blrom1—Flash GPL containing the bootloader code for VxWorks operating system on HC-MIM cards

blvxw6—Flash GPL containing the VxWorks operating system on E5-E1T1, and E5-ENET cards that are used for E1 or T1 signaling links.

bpdcn—Used to support the flash memory Board PROM for DCM, DSM, and GPSM boards, original design

bpdcn2—Used to support the flash memory Board PROM for DCM and GPSM boards, revised design

bphcap—Used to support Board PROM for HCAP flash memory

bphcapt—Supports Board PROM for HCAP-T flash memory

bphmux—Supports Board PROM for HMUX flash memory

bpmpl—Supports Board PROM for MPL flash memory

bpmplt—Supports Board PROM for E1/T1 flash memory

cd—Used in the card manufacturing process.

eoam—Used by the GPSM-II card for enhanced OAM functions

eroute—Used by STC cards for EAGLE 5 Integrated Monitoring Support functions

erthc—Used by E5-ENET and E5-ENET-B cards when the card acts as an STC card (E5-STC card) for EAGLE 5 Integrated Monitoring Support functions

gls—Used by TSM cards to download gateway screening to LIM cards

glshe—Used by E5-TSM cards to download gateway screening to LIM and SCCP cards

hipr—Communication software used on the High Speed IMT Packet Router (HIPR) card

hipr2—Communication software used on the High Speed IMT Packet Router (HIPR2) card

imt—Communication processor on the logical processing element (LPE)

imtpci—Communication software that operates the IMT bus on HC-MIM, E5-E1T1, E5-ENET, and E5-ENET-B cards

ipghc—Used by E5-ENET and E5-ENET-B cards to support point-to-multipoint IP connectivity for ANSI and ITU point codes

ipgwi—Used by SSEDCEM, E5-ENET, and E5-ENET-B cards for point-to-point IP connectivity for ITU point codes

iplhc—Used by E5-ENET and E5-ENET-B cards for point-to-point IP connectivity for ANSI and ITU point codes

iplim—Used by SSEDCEM, E5-ENET, and E5-ENET-B cards for point-to-point IP connectivity for ANSI point codes

iplimi—Used by SSEDCEM, E5-ENET, and E5-ENET-B cards for point-to-point IP connectivity for ITU point codes

ips—Used by IPSM cards for the IP User Interface feature

ipsg—Used by E5-ENET and E5-ENET-B cards to support the combined functionality of IPLIMx M2PA and IPGWx M3UA

ipshc—Used by E5-IPSM and E5-ENET-B cards to support the IPS application

mcp—Used by MCPM cards for the Measurements Platform feature

mcphe—Used by E5-MCPM-B cards for the Measurements Platform feature

oamhc—Used by E5-MCAP cards for enhanced OAM functions

pldpme1—Flash GPL used on HC-MIM and E5-E1T1 cards for E1 and T1 signaling links

sccphe—Used by E5-SM4G and E5-SM8G-B cards to support EPAP-based features and the LNP ELAP Configuration feature when no EPAP-based or LNP ELAP Configuration feature is turned on and the card acts as an STC card (E5-STC card) for EAGLE 5 Integrated Monitoring Support functions.

slanhc—Used by E5-ENET and E5-ENET-B cards to support the STPLAN application

ss7hc—Used by HC-MIM and E5-E1T1 cards. Allows the card to support up to 64 signaling links for E1 and T1 functions.

ss7ipgw—Used by SSEDCEM, E5-ENET, and E5-ENET-B cards to support point-to-multipoint IP connectivity

ss7ml—Used by MPL and E1/T1 MIM cards. The GPL allows MPL cards to support 8 signaling links. MPL cards support only the DS0 interface. The GPL allows the E1/T1 MIM card to support 8 signaling links for E1 and T1 functions.

utility—Used by the factory for testing, and when directed by the Customer Care Center

vcdu—Used in the card manufacturing process

vsccp—Used by Service Module cards to support the EPAP-based and the LNP ELAP Configuration features. If no EPAP-based or LNP ELAP Configuration feature is turned on, and if a Service Module card is present, then the GPL processes normal GTT traffic.

vxwslan—Used by SSEDCEM, E5-ENET, and E5-ENET-B cards to support the STPLAN application

:src= (optional)

Source drive. This parameter specifies the identification of the disk containing the GPL to be copied

Range: **remove, usb**

remove — The removable cartridge or drive

usb — Argument to be used by Tekelec personnel only.

:ver= (optional)

Version number of the GPL, in the form of *major-minor-fix*.

Range: *major-minor-fix*

Specify a valid value for each component of the version number, in the range **0-255**

Example

```
chg-gpl : audit=on
```

```
chg-gpl : gpl=atmitu : ver=114-1-0
```

Dependencies

No other activate, change, copy, or retrieve GPL command can be in progress when this command is entered.

If the **ver** or **gpl** parameter is specified, then both parameters must be specified.

The **audit** parameter, the **ver** and **gpl** parameters, or the **audit** and **ver** and **gpl** parameters must be specified.

A valid value must be specified for the **gpl** parameter. See the **gpl** definition for a list of valid GPLs.

Notes

If there is a failure changing the active system, the operation is stopped. If there is a failure changing the standby system, the active system is still updated.

A removable cartridge or drive must be inserted into the removable cartridge drive or latched USB port, initialized, and formatted as a system disk.

Use the **rtrv-gpl** command to determine the version number and audit state of a GPL.

The **ver** and **gpl** parameters are mandatory if a generic program load is being uploaded from a removable cartridge.

The **audit** parameter is required only when turning GPL auditing on or off and the **ver** and **gpl** parameters are optional.

When the **audit** parameter is set to **off**, the system release audit process is stopped. The detection, marking, and reporting of corrupt GPLs is continuous and not affected by turning audit off.

Output

The output for a successful command execution is in the following format; the name of the uploaded GPL is shown for card locations 1114 and 1116.

```
chg-gpl : gpl=ss7hc : ver=125-1-0
rlghncxa03w 09-03-01 11:43:04 EST EAGLE 40.1.0
SS7HC upload to 1114 completed
SS7HC upload to 1116 completed
System Release ID table upload to 1116 completed
System Release ID table upload to 1114 completed
```

;

The following example shows an error in the upload.

```
chg-gpl : gpl=bphcap : ver=101-014-000
rlghncxa03w 06-06-01 11:43:04 EST EAGLE 35.0.0
BPHCAP corrupted on 1117 removable: mismatched checksums
```

;

chg-gsm-msg

Change GSM test message

Use this command to provision GSM test messages. These messages are used by the MO SMS NPP Test Tool to test MO-based GSM SMS message processing by the NPP.

Keyword: chg-gsm-msg

Related Commands: rtrv-gsm-msg, tst-msg

Command Class: Database Administration

Parameters

:msgn= (mandatory)

Message number. This parameter specifies the GSM message number to be changed.

Range: 1-10

:active= (optional)

This parameter specifies whether the GSM test message is sent to the network card for processing.

Range: yes, no

yes — The message is sent to the network card.

- no** — The message is not sent to the network card.
- Default:** No change to the current value
- System**
- Default:** **no**
- :cdpadgts=** (optional)
Called party address digits. This parameter specifies the SCCP CdPA digits for the GSM test message.
- Range:** 1-15 digits
1 - 15 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
- Default:** No change to the current value
- System**
- Default:** **0123456789abcde**
- :cdpagti=** (optional)
Called party address global title indicator. This parameter specifies the SCCP CdPA GT for the GSM test message.
- Range:** **0-15**
- Default:** No change to the current value
- System**
- Default:** **4**
- :cdpagnai=** (optional)
Called party address global title nature of address indicator. This parameter specifies the SCCP CdPA GT NAI for the GSM test message.
- Range:** **0-127**
- Default:** No change to the current value
- System**
- Default:** **4**
- :cdpndgts=** (optional)
Called party number digits. This parameter specifies the TCAP CdPN (*SM-RP-UI TP-DA*) digits for the GSM test message.
- Range:** 1-20 digits
- Default:** No change to the current value
- System**
- Default:** **01234567890abcde**
- :cdpnnai=** (optional)
Called party number nature of address indicator. This parameter specifies the TCAP CdPN (*SM-RP-UI TP-DA*) NAI for the GSM test message.
- Range:** **0-7**
- Default:** No change to the current value
- System**
- Default:** **1**
- :cdpnp=** (optional)
Called party numbering plan. This parameter specifies the TCAP CdPN (*SM-RP-UI TP-DA*) NP for the GSM test message.
- Range:** **0-15**
- Default:** No change to the current value
- System**
- Default:** **1**
- :cgpadgts=** (optional)
Calling party address digits. This parameter specifies the SCCP CgPA digits for the GSM test message.

Range: 1-15 digits
Range is 1 - 15 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.

Default: No change to the current value

System

Default: **0123456789abcde**

:cgpagti= (optional)

Calling party address global title indicator. This parameter specifies the SCCP CgPA GT for the GSM test message.

Range: **0-15**

Default: No change to the current value.

System

Default: **4**

:cgpagnai= (optional)

Calling party address global title nature of address indicator. This parameter specifies the SCCP CgPA GT NAI for the GSM test message.

Range: **0-127**

Default: No change to the current value

System

Default: **4**

:cgpndgts= (optional)

Calling party number digits. This parameter specifies the TCAP CgPN (*SM-RP-OA MSISDN*) for the GSM test message.

Range: 1-21 digits, **none**
none—deletes the current digits

Default: No change to the current value

System

Default: **01234567890abcde**

:cgpnnai= (optional)

Calling party number nature of address indicator. This parameter specifies the TCAP CgPN (*SM-RP-OA MSISDN*) NAI for the GSM test message.

Range: **0-7**

Default: No change to the current value

System

Default: **1**

:cgpnp= (optional)

Calling party numbering plan. This parameter specifies the TCAP CgPN (*SM-RP-OA MSISDN*) NP for the GSM test message.

Range: **0-15**

Default: No change in the current value.

System

Default: **1**

:reset= (optional)

This parameter resets all of the parameters to their system default values.

Range: **yes**
yes— Message parameters are reset to their default values

Example

```

chg-gsm-
msg:msgn=1:cdpnnai=4:cdpadgts=12457896abcd:cgpnnai=2:cgpndgts=919
818541560

chg-gsm-msg:msgn=1:reset=yes

```

Dependencies

If the **reset** parameter is specified, then no other parameter can be specified.
At least one optional parameter must be specified.

Output

```

chg-gsm-msg:msgn=1:cdpnnai=4:cdpndgts=987654321:cgpnnai=4
tekelecstp 09-03-02 10:46:51 EST EAGLE 40.1.0
CHG-GSM-MSG: MASP A - COMPLTD

;

```

chg-gsmmap-scrn**Change GSM MAP Screening Entry**

Use this command to change the attributes of GSM Map Screening CgPA and CdPA entries that are used to filter out or allow SCCP messages containing Map Op-Codes, CgPA GTA+NPV+NAIV, CdPA GTA+NPV+NAIV, and forbidden parameters.

Keyword: **chg-gsmmap-scrn**

Related Commands: **dlt-gsmmap-scrn**, **ent-gsmmap-scrn**, **rtrv-gsmmap-scrn**

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:cgsr= (mandatory)

CgPA Screening Reference.

Range: *ayyy*

1 alphabetic character followed by up to 3 optional alphanumeric characters

:opname= (mandatory)

The user-defined name for the operation code. The **opname** value references the operation code (**opcode**) defined with the **ent-gsms-opcode** command. GSM MAP Screening is performed on the specified address or addresses for the referenced operation code.

Range: *ayyyyyyy*

1 alphabetic character followed by up to 7 alphanumeric characters

:cdsr= (optional)

CdPA Screening Reference.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:force= (optional)

Check Mated Application Override. This parameter must be used to complete command execution if the **npc/npca/npci/npcn/npcn24** and **nssn** parameter combination (when the **nssn** parameter has a value other than **none**) specified in the command is not already defined in the SCCP Application entity set (Remote Point Code/Mated Application Table).

Range: **yes, no**

Default: no

:naction= (optional)

The new screening action to take if a message is forbidden as defined by the **forbid** parameter.

Range: **atierr, discard, dupdisc, duplicate, forward, pass, route**

atierr— Do not route the MSU. An ATI (Any Time Interrogation) reject message is generated to the originator. This value is valid only for ATI MAP operation codes.

discard— Do not route the MSU. The MSU is discarded (thrown away) and an appropriate UIM is issued.

dupdisc— Route the original message to the duplicate node. The original message will not be sent to the original node. If, however, the duplicate node is not available for routing, the MSU is discarded.

duplicate— Route the message as normal to the original destination and route a copy of the original message to the duplicate node. If the MSU fails to route to the duplicate node, a UIM is generated indicating the duplicate routing failure.

forward— Route the original message to the forward node. The original message will not be sent to the original node. If, however, the forward node is not available for routing, the MSU is routed to the original node.

pass— Route the message as normal to the destination; a UIM will be issued. This is intended to be a test mode and is recommended when setting up GSM Map Screening during the initial phase to assure that no MSUs will be inadvertently thrown away.

route— Route the message as normal to the original destination node; no UIM will be generated. The original destination is the node to which normal GTT would be sent if no GSM MAP actions are taken.

Default: No change to current value

:ncdsr= (optional)

The new CDPA Screening Reference.

Range: *ayyy*

1 alphabetic character followed by up to 3 optional alphanumeric characters

:ncgsr= (optional)

The new CGPA Screening Reference.

Range: *ayyy*

1 alphabetic character followed by up to 3 optional alphanumeric characters

:nforbid= (optional)

The new forbidden parameter value. Indicates a forbidden parameter for the specified entry. If a forbidden parameter is detected, the message is handled with the action defined by the **action/naction** parameter.

Range: **all, none, state, location**

all—All parameters are forbidden. Take the specified screening action defined by the **naction** parameter for messages arriving at the system.

none—None of the parameters are forbidden. Route the message to its destination.

state—Take the specified screening action defined by the **naction** parameter for messages arriving at the system that contain **state** as the forbidden parameter for the entered address/operation code combination. **Note:** The **state** parameter is valid only for GSM ATI messages.

location—Take the specified screening action defined by the **naction** parameter for messages arriving at the system that contain **location** as the forbidden parameter for the entered address/operation code combination. **Note:** The **location** parameter is valid only for GSM ATI messages.

Default: No change to current value

:nmapset= (optional)

The new MAP set ID.

Range: **1-36000 dflt**
 dflt—Default MAP set

Default: No change to the MAP set value.

:npc= (optional)

New ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **npca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:npc/npca/npci/npcn/npcn24= (optional)

New point code. The **npc/npca/ npci/npcn/npcn24** and **nssn** parameters are used when the new screening action (**naction**) is **forward**, **duplicate**, or **dupdisc** (duplicate and discard). These parameters allow the craftsman to change the defined node to which the input message will be routed.

:npci= (optional)

New ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:npcn= (optional)

New ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfmtti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:npcn24= (optional)

New 24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

:nri= (optional)

New routing indicator. This parameter specifies whether a subsequent global title translation is required.

Range: gt, ssn

:nssn= (optional)

New Subsystem Number.

Range: 002 - 255 none

Default: No change to the existing value

:ntt= (optional)

New translation type. This parameter specifies the value that the CdPA TT is set to as the result of Enhanced GSM Map Screening.

Range: 0-255 none

Default: No change to the existing value

Example

```
chg-gsmmap-scrn:opname=xyz:cgsr=fela:naction=pass
chg-gsmmap-scrn:opname=xyz:cgsr=fela:cdsr=fall:naction=discard
chg-gsmmap-scrn:opname=test2:cgsr=pcn1:npcn=s-333:nssn=254
chg-gsmmap-
scrn:opname=test1:naction=forward:npc=2-2-2:nssn=20:nmapset=12
chg-gsmmap-
scrn:opname=test2:naction=duplicate:npc=1-1-2:nssn=20:cgsr=cg1:nm
apset=df1t
chg-gsmmap-scrn:opname=test3:cgsr=ad:nri=ssn
chg-gsmmap-scrn:opname=test4:cgsr=ks1:ntt=12
```

Dependencies

At least one optional parameter must be specified.

If the **cdsr** parameter is specified, at least one additional optional parameter must be specified.

If the **ncdsr** parameter is specified, then the **cdsr** parameter must be specified.

If the **cdsr** parameter is specified, then the **ncgsr** parameter cannot be specified.

The **ncgsr** parameter and the **ncdsr** parameter cannot be specified together in the same command.

The specified **cgsr** parameter value must exist in the database.

The specified **cdsr** parameter value must exist in the database.

The specified **ncgsr** parameter value cannot already exist in the database.

The specified **ncdsr** parameter value cannot already exist in the database.

The GSM Map Screening feature must be turned on before this command can be entered.

The Enhanced GSM Map Screening (EGMS) feature must be turned on before the **cdsr**, **ncdsr**, **pc**, and **pca** parameters can be specified.

The specified **opname** parameter value must exist in the GSM Map Op-Code table.

A value of **state** or **location** cannot be specified for the **nforbid** parameter unless the operation code (**opcode**) referenced by the **opname** parameter is **71**. The **opcode=71** parameter signifies an ATI MAP operation code.

A value of **atierr** cannot be specified for the **naction** parameter unless the operation code (OPCODE) referenced by **opname** is **71**.

If specified, the **npc/npca/npci/npcn/npcn24** parameter must be a full point code.

If the **naction** parameter is specified, and its value is **forward**, **duplicate**, or **dupdisc**, then the **npc/npca/npci/npcn/npcn24** parameter and the **nssn** parameter must be specified.

The **npc/npca/npci/npcn/npcn24** and **nssn** parameters must be specified before the **force** parameter can be specified.

If the **npc/npca/npci/npcn/npcn24** parameter and the **nssn** parameter are specified, and the **force** parameter is not specified as **yes**, the PC-SSN must be populated in the SCCP Application entity set (Remote Point Code / Mated Application Table).

If specified, the **npc/npca/npci/npcn/npcn24** parameter value must exist as a destination in the Ordered Route entity set (ANSI only), or must reside in a cluster that exists as a destination in the Ordered Route entity set (for global title routing).

The **npc/npca/npci/npcn/npcn24** and **nssn** parameters can be specified only if the **naction** parameter is specified and its value is **forward**, **duplicate**, or **dupdisc**.

If the value of the **naction** parameter is **forward**, **duplicate**, or **dupdisc**, then the **nmapset** parameter must be specified.

The **naction** parameter must have a value of **forward**, **duplicate**, or **dupdisc** before the **npc/npca/npci/npcn/npcn24**, **nssn**, **nri**, **ntt**, or **naction** parameters can be specified. If the **naction** parameter has a value of **forward**, **duplicate**, or **dupdisc**, then the **npc/npca/npci/npcn/npcn24** parameter and the **nssn** parameter must be specified.

The Flexible GTT Load Sharing feature must be enabled before the **nmapset** parameter can be specified.

The specified new MAP set must exist in the MAP table.

If the value of the **nmapset** parameter is not **dflt**, or if the **nmapset=dflt** parameter is specified, but the value of the **force** parameter is not **yes**, then the values for the **npc** and **nssn** parameters must exist in the new MAP set.

If the **nmapset**, **nri**, or **ntt** parameter is specified, and the **naction** parameter is not specified, then the **naction** parameter (see the **ent-gsmmap-scrn** command) must have a value of **forward**, **duplicate**, or **dupdisc**.

The **force** parameter can be specified only if the **nmapset** parameter is specified.

If the value of the **naction** parameter is **forward**, **duplicate**, or **dupdisc**, then the value specified for the **npc/npca/npci/npcn/npcn24** parameter cannot be associated with a proxy point code.

If the **nri=ssn** parameter is specified, then the **nssn=none** parameter cannot be specified.

If the **nforbid=none** parameter is specified, then the **naction** parameter must have a value of **pass**.

If the Flexible GTT Load Sharing feature is enabled, and the new or previously provisioned subsystem number has a value of **none**, then the MAP set and point code combination must already exist in the MAP table.

If the Flexible GTT Load Sharing feature is not enabled, and the new or previously provisioned subsystem number has a value of **none**, then the point code must already exist in the MAP table.

Notes

Unlike GTT (Global Title Translation) entries, the GSM MAP Screening commands do not support splits of ranges during deletion or changes of entries.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Output

```
chg-gsmap-scrn:opname=test4:cgsr=ks1:ntt=12
tekelecstp 08-08-20 19:13:01 EST EAGLE 39.2.0
GSM MAP Screening Table (1 of 4000) is 1% full
CHG-GSM MAP-SCRN: MASP A - COMPLTD
;
```

chg-gsmopts

Change GSM System Options

Use this command to enter GSM (Global System for Mobile Telecommunications) system options in the database. This command updates the GSMOPTS Table.

Keyword: chg-gsmopts

Related Commands: chg-gsmsmopts, rtrv-gsmopts, rtrv-gsmsmopts

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

NOTE: The options for the on, off, maplyrrtgon, and maplyrrtgooff parameters are described in the Notes section.

:ccnc= (optional)

E214 country code and network code.

Range: 2-8 digits

Default: No change to current value

:crptt= (optional)

Circular Route Prevention Translation Type.

Range: 0-255 none

System

Default: none

:defmapvr= (optional)

Default MAP version.

Range: 1-3

Default: No change to the current value

System

Default: 1

:defmcc= (optional)

E212 default mobile country code.

Range: 3 digits, none

Valid digits are 0-9, A-F, a-f.

- Default:** **none**—Deletes the current value for the **defmcc** parameter.
System
Default: **none**
- :defmnc=** (optional)
 E212 default mobile network code.
Range: 1-4 digits, **none**
 Valid digits are **0-9, A-F, a-f**.
none—Deletes the current value for the **defmnc** parameter.
Default: No change to the current value
System
Default: **none**
- :dfitrn=** (optional)
 Default routing number. This parameter specifies the digits to use as the routing number portion of the **msrndig** parameter when an SRI is processed by the SRI Query for Prepaid feature, an RTDB match is found for an own-network subscriber, and Service Portability is not applied.
Range: 1-15 digits, **none**
Default: No change to the current value
System
Default: **none**
- :eirgrsp=** (optional)
 Equipment Identity Register (EIR) Global Response status.
Range: **off, whitelst, graylst, blklst, unknown**
off— EIR Global Response is not used
whitelst— The IMEI is “valid”. Registration should be allowed for the handset.
graylst— The IMEI is “questionable.” Registration should be allowed, but the event is logged in the EIR log and a special measurement peg is incremented.
blklst— The IMEI is “invalid”. Registration should not be allowed for this handset.
unknown— The IMEI is not in the White, Gray, or Black list. Registration should not be allowed for this handset.
Default: No change to the current value
System
Default: **off**
- :eirmsichk=** (optional)
 Equipment Identity Register (EIR) IMSI Check status. This parameter is not valid for IMEI ranges.
Range: **on, off**
Default: No change to the current value
System
Default: **off**
- :eirrsptype=** (optional)
 Equipment Identity Register (EIR) Response Type.
Range: **type1, type2, type3**
 Table 5-6 contains information to help you choose the value for this parameter.

Table 5-6. EIR Response Type (**eirrsptype**) Values

Presence in List			EIR Response Type		
White	Gray	Black	Type 1	Type 2	Type 3
X			in white list	in white list	in white list
X	X		in gray list	in gray list	in gray list
X	X	X	in black list	in black list	in black list
X		X	in black list	in black list	in black list
	X		in gray list	in gray list	unknown
	X	X	in black list	in black list	unknown
		X	in black list	in black list	unknown
			in white list*	unknown*	unknown*

* This entry in the table indicates that there has been no match found for the IMEI in an incoming message within the database.

Default: No change to the current value

System

Default: **type1**

:gflexmaplayerrtg= (optional)

G-Flex MAP layer routing. This parameter specifies the message parameter used in the database lookup performed during G-Flex MAP layer routing.

The **gflexmaplayerrtg** parameter applies G-Flex MLR to the following MAP operations:

- updateLocation
- sendParameters
- sendAuthenticationInfo
- updateGPRSLocation
- AnyTimeInterrogation

Use the **maplyrrtgon** and **maplyrrtgoff** parameters to apply G-Flex MLR to additional MAP operations.

Range: **imsi, none, msisdn, all**

imsi — use the IMSI parameter for database lookup

none — MLR is not performed

msisdn — use the MSISDN parameter for database lookup

all — use the IMSI or MSISDN parameter for database lookup based on the operation code of the message

Default: No change to the current value

System

Default: **none**

:gsm2is41= (optional)

GSM to IS41 migration prefix.

Range: 1-15 digits, **none**
 Valid digits are **0-9, A-F, a-f**.
none—Deletes the current value of the **gsm2is41** parameter.

Default: No change to the current value

System

Default: **none**

:is412gsm= (optional)

IS41 to GSM migration prefix.

Range: 1-15 digits, **none**
 Valid digits are **0-9, A-F, a-f**.
none—Deletes the current value of the **is412gsm** parameter.

Default: No change to the current value

System

Default: **none**

:maplyrrtgooff= (optional)

MAP Layer Routing Off. This parameter turns off G-Flex MLR for a comma-separated list of MAP operations. Up to 10 operations can be specified in the list.

Range: **regss, actss, dactss, intss, authfailrpt, rstdata, procunstrqt, rdyform, purgmobss, sriloc, all**
all—Turns off G-Flex MLR for all MAP operations supported by the **maplyrrtgooff** parameter. If the **all** MAP operation is specified, then no other MAP operations can be specified in the same command.

Default: No change to the current value

:maplyrrtgon= (optional)

MAP Layer Routing On. This parameter turns on G-Flex MLR for a comma-separated list of MAP operations. Up to 10 operations can be specified in the list.

Range: **regss, actss, dactss, intss, authfailrpt, rstdata, procunstrqt, rdyform, purgmobss, sriloc, all**
all—Turns on G-Flex MLR for all MAP operations supported by the **maplyrrtgon** parameter. If the **all** MAP operation is specified, then no other MAP operations can be specified in the same command.

Default: No change to the current value

:mccmnc= (optional)

E212 mobile country code and mobile network code.

Range: 4-7 digits, **none**
 Valid digits are **0-9, A-F, a-f**.
none—Deletes the current **mccmnc** and **ccnc** parameter combination entry.

Default: No change to current value

:migrpfx= (optional)

Migration prefix. This parameter specifies whether the database routing number (RN) or the GSM to IS-41 Migration prefix is used as the source for the prefix in the SRI Ack response message for a migrated subscriber.

Range: **single, multiple**
single— The RN from the RTDB lookup is not used as the prefix in the SRI Ack. If the **gsm2is41** parameter has a value other than **none**, then that value is used as the prefix in the SRI Ack Response.
multiple— The RN from the database lookup is used as the prefix in the SRI Ack response.

Default: No change to the current value

System Default: **single** - A value of **single** is the system default value for a new system, or for a system that upgraded to 36.0 without the IGM feature being turned on. If the IGM feature was turned on before upgrade to 36.0, then a value of **multiple** is hardcoded as the system default value.

:msisdntrunc= (optional)

MS ISDN truncation digits. This parameter specifies the number of digits to delete from the beginning of the National MSISDN (MSISDN without Country Code) before formulating the MSRN parameter of the SRI Ack response.

Range: 0-5
Default: No change to current value
System Default: 0

:msrndig= (optional)

This parameter specifies the routing number to be used as is or concatenated with the MSISDN.

Range: **rn, rndn, ccrndn, rnccdn, rnasd, asdrn, rnasddn, asdrndn, ccrnasddn, ccasdrndn, rnasdcdn, asdrnccdn, rngrn, grnrn, rngrndn, grnrndn, ccrngrndn, ccgrnrndn, rngrnccdn, grnrncdn**
rn — Routing number
rndn — Routing number prefix and the international DN (dialed/directory number)
ccrndn — Country code, routing number, and national directory number
rnccdn — Routing number, country code and directory number
rnasd — Routing number and additional subscriber data
asdrn — Additional subscriber data and routing number
rnasddn — Routing number, additional subscriber data, and directory number
asdrndn — Additional subscriber data, routing number, and directory number
ccrnasddn — Country code, routing number, additional subscriber data, and directory number
ccasdrndn — Country code, additional subscriber data, routing number and directory number
rnasdcdn — Routing number, additional subscriber data, country code, and directory number
asdrnccdn — Additional subscriber data, routing number, country code, and directory number
rngrn — Routing number and generic routing number
grnrn — Generic routing number and routing number
rngrndn — Routing number, generic routing number, and directory number
grnrndn — Generic routing number, routing number, and directory number
ccrngrndn — Country code, routing number, generic routing number, and directory number
ccgrnrndn — Country code, generic routing number, routing number, and directory number
rngrnccdn — Routing number, generic routing number, country code, and directory number
grnrncdn — Generic routing number, routing number, country code, and directory number
Default: No change to the current value
System Default: **rn**

:msrnlenn= (optional)

This parameter specifies the number of digits in the MAP Routing Info portion of the returned SRI_ACK message.

Range: 1-30

- Default:** No change to the current value
System
Default: 30
- :msrnnai=** (optional)
 The nature of address indicator value for the MSRN.
Range: 0-7
 0—Unknown Nature of Address
 1—International Number
 2—National Significant Number
 3—Network Specific Number
 4—Subscriber Number
 5—Reserved for national use
 6—Abbreviated Number
 7—Reserved for extension
Default: No change to current value
- :msrnp=** (optional)
 The numbering plan value for the MSRN.
 This parameter is mandatory if the **msrnnai** parameter is specified.
Range: 0-15
Default: No change to current value
- :multcc=** (optional)
 Multiple country code.
Range: 1-3 digits
 Valid digits are 0-9, A-F, a-f.
Default: No change to current value
- :nmultcc=** (optional)
 New multiple country code.
Range: 1-3 digits, none
 Valid digits are 0-9, A-F, a-f.
 none—Deletes the specified **multcc** value from the multiple country code list.
Default: No change to current value
- :off=** (optional)
 This parameter turns off the specified options. Up to 8 comma-separated unique options can be specified.
Range: eirimsichk, encodecug, encodenps, srismgttrtg, encdnpsptnone, encdnpsdnotfound
- :on=** (optional)
 This parameter turns on the specified options. Up to 8 comma-separated unique options can be specified.
Range: eirimsichk, encodecug, encodenps, srismgttrtg, encdnpsptnone, encdnpsdnotfound
- :serverpfx=** (optional)
 Server SRI prefix.
Range: 1-4 digits, none
 Valid digits are 0-9, A-F, a-f.
 none—No Server SRI prefix is provisioned
Default: No change to current value
System
Default: none

:sporttype= (optional)

Service Portability type. This parameter specifies whether Service Portability applies to SRI Query for Prepaid messages for own-network subscribers.

NOTE: If Service Portability is performed, then the Service Portability prefix (RTDB 'GRN'entity id) is applied.

NOTE: The S-Port feature must be turned on before any change to the parameter will impact the G-Port SRI Query for Prepaid feature.

Range: gsm, is41, all, none

gsm — Apply Service Portability prefix for own-network GSM subscribers

is41 — Apply Service Portability prefix for own-network IS41 subscribers

all — Apply Service Portability prefix for all own-network (IS41 and GSM) subscribers

none — Service Portability is not performed for this feature

Default: No change to the current value

System

Default: none

:srfaddr= (optional)

Entity address of the MNP_SRF node.

Range: 1-15 digits, none

Valid digits are **0-9, A-F, a-f**.

none—Deletes the current value for the **srfaddr** parameter.

Default: No change to current value

System

Default: none

:srfnai= (optional)

The nature of address indicator value of the MNP_SRF.

Range: 0-127

Default: No change to current value

:srfnp= (optional)

The numbering plan value of the MNP_SRF.

Range: 0-15

Default: No change to current value

:sridn= (optional)

The Send Routing Information Dialed Number location.

Range: tcap, sccp

Default: No change to current value

System

Default: tcap

:sridnnotfound= (optional)

This parameter specifies the processing that is used when G-Port encounters an RTDB query result that indicates that the specified directory number is not known.

Range: gtt, srinack

gtt — GTT is performed on the message for routing to an HLR

srinack — an SRI negative acknowledgement is generated and returned to the calling party

Default: No change to the current value

System

Default: gtt

Example

```

chg-
gsmopts:msisdntrunc=1:srfaddr=123456789abcdef:srfnai=0:srfnp=0
chg-gsmopts:msrnnai=1:msrnp=1:msrndig=ccrndn:defmapvr=2
chg-gsmopts:sridn=sccp
chg-gsmopts:is412gsm=1234:gsm2is41=1234
chg-gsmopts:serverpfx=1000
chg-gsmopts:multcc=011
chg-gsmopts:multcc=011:nmultcc=11

a

```

Dependencies

At least one parameter must be specified.

The G-Flex feature must be turned on before the **defmnc**, **ccnc**, or **mccmnc** parameter can be specified.

The G-Port or IGM feature must be enabled before the **srfaddr**, **msrndig**, **msrnnai**, **sridn**, **msisdntrunc**, **migrpfx**, **gsm2is41**, or **serverpfx** parameter can be specified and before a value of **encodecug**, **encodenps**, **srismgrnrtg**, **encondnpsptnone**, or **encondnpsdnotfound** can be specified for the **on** or **off** parameter.

An **is412gsm** parameter value must exist in the database before the **serverpfx** parameter can be specified.

The **serverpfx** value must be set to **none** in the database before the **is412gsm** value can be set to **none**.

The EIR feature must be turned on before the **eigrsp**, **eirrsptype**, or **eirimsichk** parameter can be specified and before the **eirimsichk** option can be specified for the **on** or **off** parameter.

The **ccnc** and **mccmnc** parameter values must be specified together in the command.

A maximum of 10 **ccnc** records can exist in the database.

The value specified for the **ccnc** parameter cannot already exist in the database unless the **mccmnc=none** parameter is specified.

The **srfaddr**, **srfnai**, and **srfnp** parameters must be specified together in the command.

The **msrnnai** and **msrnp** parameters must be specified together in the command.

The value specified for the **ccnc** parameter must already exist in the database if the **mccmnc=none** parameter is specified.

A maximum of 10 entries can be defined in the multiple country code list (in addition to the STP options **defcc** value).

A multiple country code cannot be entered when the STP options **defcc** value is none. A **defcc** value must first be defined before the first multiple country code can be entered. See the **chg-stpopts** command.

The value specified for the **nmultcc** parameter cannot already exist in the multiple country code list. If the **multcc** and **nmultcc** parameters are specified to change the **multcc** value to the **nmultcc** value, then the **multcc** value must already exist in the multiple country code list.

The specified **multcc** and **nmultcc** values cannot already be defined as the STP options **defcc** parameter value.

The IGM feature must be enabled before the **is412gsm**, **gsm2is41**, or **migrpfx** parameter can be specified.

The G-Port, IGM, MO SMS ASD, MO SMS B-Party Routing, MO SMS GRN, MO SMS IS41-to-GSM Migration, MO-based GSM SMS NP, or Prepaid SMS Intercept Ph1 feature must be enabled, or the G-Flex, EIR, or V-Flex feature must be turned on before this command can be entered.

The G-Port or IGM feature must be enabled or the V-Flex feature must be turned on before the **multcc** and **nmultcc** parameters can be specified.

The G-Flex MAP Layer Routing feature must be enabled and turned on before the **gflexmaplayerrtg**, **maplyrrtgon**, or **maplyrrtgooff** parameter can be specified.

The G-Flex or G-Port feature must be turned on or the MT-Based GSM SMS NP or IGM feature must be enabled before the **defmcc** parameter can be specified.

If the MT-Based GSM SMS NP feature is turned on, then the **defmcc=none** parameter cannot be specified.

The **nmultcc** and **multcc** parameters must be specified together in the command.

If the **multcc** parameter is specified to enter a new value in the multiple country list, then the specified value cannot already exist in the list.

The IGM or MO SMS IS41-to-GSM Migration feature must be enabled before the **is412gsm** parameter can be specified.

The G-Port feature must be enabled before the **sridnotfound** parameter can be specified.

The G-Port feature must be turned on before the **migrpfx=multiple** parameter can be specified.

The G-Port, IGM, MO SMS ASD, MO SMS B-Party Routing, MO SMS GRN, MO-based GSM SMS NP, or Prepaid SMS Intercept Ph1 feature must be enabled before the **defmapvr** parameter can be specified.

The G-Port SRI Query for Prepaid feature must be enabled before the **dfitrn** parameter can be specified.

The S-Port and G-Port SRI Query for Prepaid features must be enabled before the **sporttype** parameter can be specified.

The G-Flex feature must be turned on or the G-Port or IGM feature must be enabled before the **ccnc** and **mccmnc** parameters can be specified.

The G-Flex feature must be turned on or the G-Port or IGM feature must be enabled before the **ccnc** and **mccmnc** parameters can be specified.

The MNP Circular Route Prevention feature must be turned on before the **crptt** parameter can be specified.

The **eirimsichk** parameter and the **on** or **off** parameter cannot be specified together in the command.

The same value cannot be specified for the **on** and **off** parameters.

The same MAP operation cannot be specified by the **maplyrrtgon** and **maplyrrtgoff** parameters in the same command.

If the **all** MAP operation is specified for the **maplyrrtgon** or **maplyrrtgoff** parameter, then no other operation can be specified for these parameters in the same command.

If the **maplyrrtgon=all** parameter is specified, then the **maplyrrtgoff** parameter cannot be specified in the same command.

If the **maplyrrtgoff=all** parameter is specified, then the **maplyrrtgon** parameter cannot be specified in the same command.

Notes

The **sridn** parameter can be used with the G-Port feature only or with the G-Port feature and the MNP Circular Route Prevention feature. Refer to the *Feature Manual - G-Port* for more information.

If the IGM feature was turned on prior to upgrade to Release 36.0, then the migration prefix is hard-coded to a value of **multiple**. After upgrade, if the **chg-gsmopts:migrpfx=single** command is used to change the migration prefix to **single**, then the G-Port feature must be turned on before the migration prefix can be changed back to **multiple** (**chg-gsmopts:migrpfx=multiple**).

on/off options

- **eirimsichk**—Specifies the use of the Equipment Identity Register (EIR) IMSI Check status. This option is not valid for IMEI ranges. This option has a default of OFF.
- **endcodeug**—Specifies whether the Closed User Group (CUG) Checkinfo from the SRI message is included in the SRI Ack message. This option has a default of OFF.
- **enodenps**—Specifies whether the Number Portability Status Indicator (NPSI) is included in SRI Ack messages when the portability type (PT) has a value of **0**, **1**, **2** or **36**. This option has a default of ON.
- **srismgttrtg**—Specifies whether the SRI_SM routing feature is on. This option has a default of OFF.
- **encdnpsptnone**—Specifies whether the NPSI is included in SRI Ack messages when the PT has a value of **none** (**255**). This option has a default of OFF.
- **encdnpsdnotfound**—Specifies whether the NPSI is included in SRI Ack messages when the DN is not found. This option has a default of OFF.

MAP Operations Supported by the maplyrrtgon and maplyrrtgoff Parameters

The **maplyrrtgon** and **maplyrrtgoff** parameters are used to turn G-Flex MLR on and off, respectively, for the following MAP operations:

- **regss**: registerSS—Register Supplementary Service
- **actss**: activateSS—Activate Supplementary Service
- **dactss**: deactivateSS—Deactivate Supplementary Service
- **intss**: interrogateSS—Interrogate Supplementary Service
- **authfailrpt**: authenticationFailureReport—Authentication Failure Report
- **rstdata**: restoreData—Restore Data
- **procunstrqt**: processUnstructuredSS-Request—Process Unstructured SS Request
- **rdyformsm**: readyForSM—Ready For Short Message

- **purgmobss:** purgeMS—Purge Mobile Subscriber
- **sriloc:** sendRoutingInfoForLCS—Send Routing Information for Location Service

Output

```
chg-gsmopts:msrnnai=1:msrnp=1:msrndig=ccrngrndn:defmapvr=2
tekelecstp 09-05-05 12:28:07 EST EAGLE 41.1.0
CHG-GSMOPTS: MASP A - COMPLTD
;
```

chg-gsms-opcode

Change GSM MAP Screening Operation Code

Use this command to change the attributes of the GSM (Global System for Mobile Telecommunication) MAP (mobile application part) screening operation codes. The command allows you to change the default screening action and the operation-code name for a specific operation code.

Keyword: chg-gsms-opcode

Related Commands: dlt-gsms-opcode, ent-gsms-opcode, rtrv-gsms-opcode

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:opname= (mandatory)

Operation code name. This parameter specifies the user-defined name for the operation code.

Range: *ayyyyyyy*

1 alphabetic character followed by up to 7 alphanumeric characters

:force= (optional)

Check Mated Application Override. This parameter must be used to complete command execution if the **npc/npca/npci/npcn/npcn24** and **nssn** parameter combination (when the **nssn** parameter has a value other than **none**) specified in the command is not already defined in the SCCP Application entity set (Remote Point Code/Mated Application Table).

Range: **yes, no**

Default: **no**

:ndfltact= (optional)

New default screening action.

Range: **pass, discard, atierr, route, forward, duplicate, dupdisc**

pass—Route the message as normal to the destination; a UIM will be issued. This is intended to be a test mode and is recommended when setting up GSM Map Screening during the initial phase to assure that no MSUs will be inadvertently thrown away.

discard—Do not route the MSU. The MSU is discarded (thrown away) and an appropriate UIM is issued.

atierr—Do not route the MSU. An ATI (Any Time Interrogation) reject message is generated to the originator. This value is valid only for ATI MAP operation codes.

route—Route the message as normal to the original destination node; no UIM will be generated. The original destination is the node to which normal GTT would be sent if no GSM MAP actions are taken.

forward—Route the original message to the forward node. The original message will not be sent to the original node. If, however, the forward node is not available for routing, the MSU is routed to the original node.

duplicate—Route the message as normal to the original destination and route a copy of the original message to the duplicate node. If the MSU fails to route to the duplicate node, a UIM is generated indicating the duplicate routing failure.

dupdisc—Route the original message to the duplicate node. The original message will not be sent to the original node. If, however, the duplicate node is not available for routing, the MSU is discarded.

Default: No change to the current value

:nmapset= (optional)

New MAP set ID.

Range: **1-36000 dflt**
dflt—Default MAP set

:nopname= (optional)

New operation code name.

Range: *ayyyyyyy*
1 alphabetic character followed by up to 7 alphanumeric characters

Default: No change to current value

:npc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **npca**

Range: **000-255**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.
When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.
When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.
The point code **000-000-000** is not a valid point code.

:npc/npca/npci/npcn/npcn24= (optional)

New point code. The **npc/npca/npci/npcn/npcn24** and **nssn** parameters are used when the default screening action (**dfltact**) is **forward**, **duplicate**, or **dupdisc** (duplicate and discard). These parameters allow the craftsperson to change the defined node to which the input message will be routed.

:npci= (optional)

New ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—**s-**
zone—**0-7**
area—**000-255**
id—**0-7**
The point code **0-000-0** is not a valid point code.

:npcn= (optional)

New ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:npcn24= (optional)

New 24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:nri= (optional)

New routing indicator. This parameter specifies whether a subsequent global title translation is required.

Range: **gt, ssn**

:nssn= (optional)

New Subsystem Number.

Range: **2-255 none**

Default: No change to the existing value

:ntt= (optional)

New translation type. This parameter specifies the value that the CdPA TT is set to as the result of Enhanced GSM Map Screening.

Range: **0-255 none**

Default: No change to the existing value

Example

```
chg-gsms-opcode:opname=ati:ndfltact=atierr
```

```
chg-gsms-
```

```
opcode:opname=ati:ndfltact=forward:npci=1-1-1:nssn=5:force=yes
```

```
chg-gsms-opcode:opname=xyz:npc=9-9-9:nssn=3
```

```
chg-gsms-opcode:opname=test2:npci=s-1-1-1
```

```
chg-gsms-
```

```
opcode:opname=test2:ndfltact=dupdisc:npci=1-1-1:nssn=5:nmapset=8
```

```
chg-gsms-
```

```
opcode:opname=ts4:ndfltact=forward:npc=1-1-2:nssn=5:nmapset=df1t
```

chg-gsms-opcode : opname=test : nri=ssn

chg-gsms-opcode : opname=test4 : ntt=12

Dependencies

At least one optional parameter must be specified.

If the **ndfltact** parameter is specified and its value is **forward**, **duplicate**, or **dupdisc**, the **npc/npca/npci/npcn/npcn24** and **nssn** parameters must be specified.

The reserved word **none** cannot be specified as a value for the **opname** parameter or **nopname** parameter.

If the **npc/npca/npci/npcn/npcn24** and **nssn** parameters are specified with the **ndfltact** parameter, the **ndfltact** parameter value must be **forward**, **duplicate**, or **dupdisc**.

The **npc/npca/npci/npcn/npcn24** and **nssn** parameters must be specified before the **force** parameter can be specified.

The value specified for the **opname** parameter must already exist in the GSM Map Op-Code table.

The GSM Map Screening feature must be turned on before this command can be entered.

The EGMS feature must be enabled and turned on before the **npc** or **npca** parameters can be specified.

The **ndfltact=atierr** parameter cannot be specified unless the value of the operation code referenced by the **opcode** parameter is **71**. The **atierr** option is valid only for ATI MAP operation codes, and the **opcode=71** parameter signifies an ATI MAP operation code.

If specified, the **npc/npca/npci/npcn/npcn24** parameter value must be a full point code.

If the **npc/npca/ npci/npcn/npcn24** parameter and the **nssn** parameter are specified, and the **force** parameter is not specified as **yes**, the PC-SSN must be populated in the SCCP Application entity set (Remote Point Code / Mated Application Table).

If specified, the **npc/npca/npci /npcn/npcn24** parameter value must exist as a destination in the Ordered Route entity set or reside in a cluster (ANSI only) that exists as a destination in the Ordered Route entity set (for global title routing).

The **nmapset** parameter must be specified if the value of the **ndfltact** parameter is **forward**, **duplicate**, or **dupdisc**.

If the **ndfltact** parameter is specified with the **nmapset**, **nri**, **ntt**, **pc**, or **ssn** parameter, then the **ndfltact** parameter must have a value of **forward**, **duplicate**, or **dupdisc**.

The **nmapset** parameter must be specified before the **force** parameter can be specified.

The Flexible GTT Load Sharing feature must be enabled before the **nmapset** parameter can be specified.

The specified new MAP set must exist.

If the **nmapset=dflt** parameter is not specified, or the **nmapset=dflt** parameter is specified, but the **force=yes** parameter is not specified, then the new PC and new SSN must exist in the new MAP set.

If the **nmapset**, **nri**, or **ntt** parameter is specified, and the **ndfltact** parameter is not specified, then the **dfltact** parameter must have a previously provisioned value of **forward**, **duplicate**, or **dupdisc**.

If the value of the **ndfltact** parameter is **forward**, **duplicate**, or **dupdisc**, then the value specified for the **npc/npca/npci/npcn/npcn24** parameter cannot be associated with a proxy point code.

If the **nri=ssn** parameter is specified, then the **ssn=none** parameter cannot be specified.

If the Flexible GTT Load Sharing feature is enabled, and the new or previously provisioned subsystem number has a value of **none** (the **nssn=none** parameter is specified in this command, or

the **ssn=none** parameter was specified in the **ent-gsms-opcode** command), then the new or previously provisioned MAP set and point code combination must already exist in the MAP table.

If the Flexible GTT Load Sharing feature is not enabled, and the new or previously provisioned subsystem number has a value of **none** (the **nssn=none** parameter is specified in this command, or the **ssn=none** parameter was specified in the **ent-gsms-opcode** command), then the point code must already exist in the MAP table.

Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Output

```
chg-gsms-opcode:opname=test4:ntt=12
tekelecstp 08-08-20 19:13:01 EST EAGLE 39.2.0
CHG-GSM-OPCODE: MASP A - COMPLTD
;
```

chg-gsmsmsopts

Change GSM SMS System Options

Use this command to enter GSM SMS system options in the database. This command updates the GSMSMSOPTS table.

Keyword: chg-gsmsmsopts

Related Commands: chg-gsmopts, rtrv-gsmopts, rtrv-gsmsmsopts

Command Class: Database Administration

Parameters

:bpartygttsn= (optional)

MO SMS B-Party Routing GTT Set name. This parameter specifies the GTT set where Global Title Translation lookup on B-Party digits is performed.

Range: *ayyyyyyy*
1 alphabetic character followed by up to 8 alphanumeric characters.

Default: No change to the current value

System

Default: none

:defis41smc= (optional)

Default IS41 short message service center. This parameter specifies the default SMSC where an SRI_SM message received for an own network IS41 subscriber is relayed.

Range: 1-15 digits, **none**
Default: No change to the current value

System

Default: none

:defrn= (optional)

Default routing number. This parameter specifies a default routing number that is used for own-network subscribers.

Range: 1-15 digits, **none**
Valid digits are **0-9, A-F, a-f**.

Default: No change to the current value

System

Default: none

:igmsmsrelay= (optional)

IGM - based SMS relay. This parameter specifies whether IGM relays an SRI_SM message that is received for an own network IS41 subscriber to a default SMSC or sends an SRI_SM-NACK error message.

Range: **yes, no**
 yes — IGM relays the message to the default SMSC
 no — IGM sends an SRI_SM-NACK

Default: No change to the current value

System

Default: **no**

:is41smscgttsn= (optional)

IS41 SMSC GTT Set name. This parameter specifies the GTT set where Global Title Translation lookup on default IS41 SMSC digits is performed.

Range: *ayyyyyyy*
 1 leading alphabetic and up to 8 following alphanumeric characters.

Default: No change to the current value

:mosmsaclen= (optional)

This parameter specifies the number of the digits that are taken from the MO SMS CgPA and used as the Area Code in the MO SMS CdPA.

Range: **0-8**
Default: No change to the current value

System

Default: **0**

:mosmsdigmat= (optional)

MO-based SMS Home SMSC match. This parameter specifies the method used by the Portability Check for MO SMS or the MO-based GSM SMS NP feature to find a Home SMSC match.

Range: **exact, bestfit**
 exact — The system searches for an exact match of digits in the HomeSMSC Table.
 bestfit — The system searches for a match on the leading digits of an incoming message with any provisioned entry in HomeSMSC table if an exact match is not found.

Default: No change to the current value

System

Default: **exact**

:mosmsfwd= (optional)

MO-based SMS forward. This parameter specifies whether the value of the SCCP CDPA in the MO-based SMS message is modified to the GTA value that is specified by the **mosmsgta** parameter.

Range: **yes, no**
 yes — The SCCP CDPA value is modified.
 no — The SCCP CDPA value is not modified.
 The **mosmsgta** parameter must be specified before the **mosmsfwd=yes** parameter can be specified.

Default: No change to the current value

System

Default: **no**

:mosmsgta= (optional)

MO-based SMS GTA. This parameter specifies the GTA value that is used to replace the SCCP CDPA value in the MO-based SMS message.

Range: 5-21 digits, **none**
Default: No change to the current value

System**Default:** none**:mosmsgttdig=** (optional)

MO SMS B-Party Routing GTT digits. This parameter specifies the digits that are used for Global Title Translation.

Range: sccpcdpa, mapbparty

sccpcdpa — The SCCP CdPA is used for GTT.

mapbparty — The MAP B-Party number is used for GTT.

Default: No change to the current value**System****Default:** sccpcdpa**:mosmsnai=** (optional)

MO-based SMS NAI. This parameter specifies the number conditioning that is performed on the SMS message destination address before lookup in the number portability database is performed.

Range: intl, nai, nat, unknown

intl — Number is treated as INTL (1) for number conditioning.

nai — The NAI from the SMS message is used to perform number conditioning.

nat — Number is treated as NATL (2) for number conditioning.

unknown — Number is treated as UNKNOWN (0) for number conditioning.

A value of **nai** must be specified before the **intl**, **natl**, **nai1**, **nai2**, **nai3**, and **unkn** parameters in the **chg-npp-serv** command can be changed to non-default values for the MOSMSGCDPN service.

Default: No change to the current value**System****Default:** intl**:mosmssa=** (optional)

MO-based SMS sub-address. This parameter specifies whether the sub-address is searched in the SMS called party (destination address).

Range: yes, no

yes — Sub-address is searched in the SMS called party.

no — Sub-address is not searched in the SMS called party.

Default: No change to the current value**System****Default:** no**:mosmstcapseg=** (optional)

MO-based SMS TCAP Segmentation for GSM. This parameter specifies whether Mobile-Originated segmented TCAP messages are supported.

Range: on, off

on — Segmented messages are supported.

off — Segmented messages are not supported.

Default: No change to the current value**System****Default:** off**:mosmstype=** (optional)

MO-based SMS type. This parameter specifies the value of the entity type that indicates that a successful lookup occurred in the number portability database.

Range: sp, rn, sprn, all

sp — signaling point

rn — routing number

sprn— Lookup is successful if the value of the entity type is **sp** or **rn**.
all— Lookup is successful if the value of the entity type is **sp** or **rn**, or if no entity type is found.

Default: No change to the current value

System

Default: **sprn**

:mtmmsackn= (optional)

MT-Based MMS acknowledgement. This parameter specifies the message that is generated in response to a successful number portability database lookup for an SRI_SM message from a Home MMSC.

Range: **ack, nack**

ack— SRI_SM_ACK message

nack— SRI_SM_NACK (Return Error) message

Default: No change to the current value

System

Default: **ack**

:mtmmsentyn= (optional)

MT-Based MMS Entity length. This parameter specifies the maximum number of digits that are used from the entity value of a returned RN, SP, or SRFIMSI entity for Multimedia Service (MMS) processing.

Range: **1-15 none**

none—all digits from the entity value are used

Default: No change to the current value

System

Default: **none**

:mtmmsgta= (optional)

MT-Based MMS GTA. This parameter specifies the GTA that is compared with the SCCP CgPA GTA of an SRI_SM message to determine whether the originator of the message is a Home MMSC.

Range: 5-21 digits, **none**

Valid digits are **0-9, A-F, a-f**.

none—Deletes the current value of the **mtmmsgta** parameter.

Default: No change to the current value

System

Default: **none**

:mtmmslen= (optional)

MT-Based MMS Length. This parameter indicates the maximum number of digits used in the returned IMSI and/or NNI fields for MMS processing.

Range: **1-24 none**

none—all digits from the fields are used

Default: No change to the current value

System

Default: **none**

:mtmmstype= (optional)

MT-Based MMS type. This parameter specifies the value of the entity type that indicates that a successful lookup occurred in the number portability database.

Range: **sp, rn, sprn, all, nonsp**

sp— signalling point

rn— routing number

sprn— **sp** or **rn**

- all**— **sp**, **rn**, or DN with no entity
nonsp— **rn** or DN with no entity
Default: No change to the current value
System
Default: **rn**
- :mtsmsackn=** (optional)
 MT-Based SMS acknowledgement. This parameter specifies the message that is generated in response to a successful number portability database lookup for an SRI_SM message from a Home SMSC.
Range: **ack**, **nack**
ack— SRI_SM_ACK message
nack— SRI_SM_NACK (Return Error) message
Default: No change to the current value
System
Default: **ack**
- :mtsmschksrc=** (optional)
 MT-Based SMS check source. This parameter specifies whether the SCCP CgPA GTA of a SRI_SM message is validated to determine if the source of the message is a Home SMSC.
Range: **yes**, **no**
yes— The SCCP CgPA GTA of an SRI_SM message is validated.
no— The SCCP CgPA GTA of an SRI_SM message is not validated.
 If the **mtsmschksrc=yes** parameter is specified, and if the incoming SRI_SM message has SCCP CgPA GTA, then the SCCP CgPA GTA must be found in the Home SMSC list for the source of the message to be considered a Home SMSC. If the message is not found in the Home SMSC list, then the MT-Based GSM SMS NP feature does not process the message.
 If the **mtsmschksrc=no** parameter is specified, or if SCCP CgPA GTA does not exist in the incoming message, then the source of the message is considered to be a Home SMSC, and the MT-Based GSM SMS NP feature considers the message for processing.
Default: No change to the current value
System
Default: **no**
- :mtsmsdltr=** (optional)
 MT-Based SMS delimiter. This parameter specifies whether to insert a delimiter digit string before or after the routing number (RN) if the RN is used in the outbound digit format. The delimiter string that is inserted is determined by the **mtsmsdltrv** parameter.
Range: **no**, **prern**, **postrn**
no— A delimiter digit string is not inserted.
prern— A delimiter digit string is inserted before the RN.
postrn— A delimiter digit string is inserted after the RN.
Default: No change to the current value
System
Default: **no**
- :mtsmsdltrv=** (optional)
 MT-Based SMS delimiter value. This parameter specifies the delimiter digit string that is inserted before or after the RN when the RN is used in the outbound digit format.
Range: 1-5 digits, **none**
 Valid digits are **0-9**, **A-F**, **a-f**.
Default: No change to the current value

System**Default:** none**:mtsmsimsi=** (optional)

MT-Based SMS IMSI. This parameter specifies the required format of digits that are encoded in the “IMSI” parameter of the SRI_SM response message.

Range: **rn, rndn, ccrndn, dn, srfimsi, mccrndn****rn**— routing number**rndn**— routing number and the international dialed or directory number**ccrndn**— country code, routing number, and national directory or dialed number**dn**— directory or dialed number**srfimsi**— IMSI is encoded as the “SRFIMSI” parameter from the number portability database.**mccrndn**— mobile country code, routing number, and directory or dialed number**Default:** No change to the current value**System****Default:** **mccrndn****:mtsmsnakerr=** (optional)

MT-Based SMS negative acknowledgement error. This parameter specifies the TCAP error choice code used in the NACK response message generated for SRI_SM messages.

Range: **0-255****Default:** No change to the current value**System****Default:** **1****:mtsmsnni=** (optional)

MT-Based SMS network node indicator. This parameter specifies the required format of digits that are encoded in the “Network Node Number” parameter of the SRI_SM response message.

Range: **rn, rndn, ccrndn, dn, srfimsi, mccrndn, none****rn**— routing number**rndn**— routing number and the international dialed or directory number**ccrndn**— country code, routing number, and national directory or dialed number**dn**— Directory or Dialed Number**srfimsi**— IMSI is encoded as the “SRFIMSI” parameter from the number portability database.**mccrndn**— mobile country code, routing number, and directory or dialed number.**none**— The Network Node Number parameter is not encoded in the response message.**Default:** No change to the current value**System****Default:** **rn****:mtsmstype=** (optional)

MT-Based SMS type. This parameter specifies the value of the entity type that indicates that a successful lookup occurred in the number portability database for messages that are modified by the MT-Based GSM SMS NP feature.

Range: **sp, rn, sprn, all, nonsp****sp**— signalling point**rn**— routing number**sprn**— **sp** or **rn****all**— **sp, rn,** or DN with no entity**nonsp**— **rn** or DN with no entity**Default:** No change to the current value**System****Default:** **rn**

:spfill= (optional)

This parameter specifies whether the Numbering Plan Processor (NPP) can populate SP and RN entities for own network subscribers at the same time.

Range: **off, on**

off— Do not populate the RN and SP entities at the same time

on— Allow population of the RN and SP entities at the same time

Default: No change to the current value

System

Default: **off**

:sporttype= (optional)

Service Portability type. This parameter specifies whether Service Portability is performed for the associated feature.

The S-Port feature must be enabled before this parameter can be specified. The S-Port feature must be turned on before any change to the parameter will impact the associated feature.

If Service Portability is performed, then the Service Portability prefix (RTDB 'GRN' entity id) is applied.

Range: **gsm, is41, all, none**

gsm, none— apply Service Portability prefix for own-network GSM subscribers

is41, none— apply Service Portability prefix for own-network IS41 subscribers

all, none— apply Service Portability prefix for all own-network (IS41 and GSM) subscribers

none—Service Portability is not performed

none—Service Portability is not performed for the feature.

Default: No change to the current value

System

Default: **none**

:srismdn= (optional)

SRI_SM DN location. This parameter specifies whether the MT-Based GSM SMS NP feature selects the MSISDN from the TCAP or SCCP CdPA section of the SRI_SM message.

Range: **sccp, tcap**

sccp— select the MSISDN from the SCCP CDPA section

tcap— select the MSISDN from the TCAP section

Default: **sccp**

Example

```
chg-gsmsmsopts:mosmsnai=intl:mosmstype=sp:mosmssa=no
```

```
chg-gsmsmsopts:mosmsfwd=no:mosmsgta=987654321
```

```
chg-gsmsmsopts:srismdn=tcap
```

```
chg-
```

```
gsmsmsopts:mtsmsackn=nack:mtsmsdltr=no:mtsmsdltrv=125:mtsmschksrc=no
```

```
chg-
```

```
gsmsmsopts:mtmsgta=51111:mtmstype=sp:mtmsackn=nack:mtmssentyle  
n=7:mtmslen=10
```

```
chg-gsmsmsopts:mosmsdigmat=bestfit
```

```
chg-gsmsmsopts:bpartygttsn=setint001:mosmsgttldig=mapbparty
```

```
chg-gsmsmsopts:mosmsaclen=4
```

chg-gsmsmsopts : mosmstcapseg=on

Dependencies

At least one parameter must be specified.

The Hex Digit Support for GTT feature must be enabled before a hexadecimal value for the **mosmsgta** parameter can be specified.

The **mosmsgta** parameter must be specified before the **mosmsfwd=yes** parameter can be specified.

The **mtsmsdltrv** parameter must be provisioned before a value of **prern** or **postrn** can be specified for the **mtsmsdltr** parameter.

The value specified for the **bpartygttsn** or **is41smcgttsn** parameter must match the name of an existing GTT Set.

The **mosmsgttldig=sccpcdpa** parameter must be specified before the **bpartygttsn=none** parameter can be specified.

The GTT set specified for the **bpartygttsn** or **is41smcgttsn** parameter must have **settype=cdgta** (see the **ent-gttset** command).

If the **bpartygttsn=none** parameter is specified, then the **mosmsgttldig=mapbparty** parameter cannot be specified.

The MO-based GSM SMS NP, MO SMS ASD, or MO SMS GRN feature must be enabled before the **mosmsfwd** or **mosmsgta** parameter can be specified.

The Portability Check for MO SMS feature or the MO-based GSM SMS NP feature must be turned on before the **mosmsdigmat** or **mosmstcapseg** parameter can be specified.

The MT-Based GSM SMS NP feature must be enabled before the **mtsmsimsi**, **mtsmsnni**, **mtsmstype**, **mtsmsackn**, **mtsmsdltr**, **mtsmsdltrv**, **mtsmsnakerr**, **mtsmschksrc**, or **srismdn** parameter can be specified.

The MT-Based GSM MMS NP feature must be enabled before the **mtmmsgta**, **mtmmstype**, **mtmmsackn**, **mtmmsentyn**, or **mtmmslen** parameter can be specified.

The MO SMS B-Party Routing feature must be enabled before the **bpartygttsn** or **mosmsgttldig** parameter can be specified.

The MO-based GSM SMS NP feature must be enabled before the **mosmstype**, **defrn**, or **spfill** parameter can be specified.

The MO SMS ASD, MO SMS GRN, MO-based GSM SMS NP, or Prepaid SMS Intercept Ph feature must be enabled before the **mosmsaclen**, **mosmsnai**, or **mosmssa** parameter can be specified.

If a digit string value has already been specified for the **mosmsgta** or **mtsmsdltrv** parameter, then a value of **none** cannot be specified subsequently for that parameter.

The IS41 GSM Migration feature must be turned on before the **igsmsrelay**, **is41smcgttsn**, or **defis41smc** parameter can be specified.

If the **defis41smc=none** parameter is specified, then the **igsmsrelay=yes** parameter cannot be specified.

If the **defis41smc** parameter has a value other than **none**, then the **is41smcgttsn=none** parameter cannot be specified.

The S-Port feature must be enabled before the **sporttype** parameter can be specified.

The EGTT feature must be turned on before the **is41smcgttsn** parameter can be specified.

Notes

The **mosmstcapseg** parameter is turned off automatically if the Portability Check for MO SMS feature is turned off or the temporary FAK for the feature expires, and the MO-based GSM SMS NP feature is not enabled.

Output

```
chg-
gsmmsmsopts:is41smscgttsn=set1:defis41smsc=1234:igsmmsrelay=yes
tekelecstp 09-06-08 18:52:54 EST EAGLE 41.1.0
CHG-GSMMSMISOPTS: MASP A - COMPLTD
;
```

chg-gta**Change Global Title Address Information**

Use this command to change the global title address information (GTA) for applicable global title selectors required to specify a global title entry.

This command changes the routing objects for messages requiring global title translations. The specified point code, subsystem number, MRN set ID, and routing indicator overwrite the existing data values.

When the Intermediate GTT Load Sharing feature and the Flexible GTT Load Sharing feature are both on, multiple relationships can be defined among a set of destination point codes in the existing MRN table. The relationship used in a particular translation is based on the GTA digits used for translation. The MRN Set ID and the post-translation PC create a key that is used to perform a lookup in the MRN table. This lookup results in a set of alternate PCs from which a PC is selected, based on relative cost, to route the MSU in most cost-effective way.

NOTE: If the EGTT feature is turned on, then the GTT Selector (ent/chg/dlt/rtrv-gttset), GTT Set (ent/dlt/rtrv-gttset), and GTA (ent/chg/dlt/rtrv-gta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is on.

Keyword: chg-gta

Related Commands: dlt-gta, ent-gta, rtrv-gta

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

NOTE: As of Release 42.0, the **ntt**, **ngti**, **nnai**, **nnp**, **npdd**, **npds**, **nsdd**, **nsds**, and **rmgtt** parameters are obsolete for this command. These parameters will be provisioned using the **ent/chg-gtmod** commands.

:gttsn= (mandatory)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

Range: ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

:acn= (optional)

Application context name. This parameter specifies the ITU TCAP *acn* field in the incoming MSU.

Range: **0-255 ***, **none**
 The **acn** supports up to 7 subfields separated by a dash (e.g.,
1-202-33-104-54-26-007).
 *—any valid value in the ITU TCAP *acn* field in the incoming MSU
none—there is no ITU TCAP *acn* field in the incoming MSU

Default: No change to the current value

:actsn= (optional)

GTT Action Set Name.

Range: *ayyyyyyy*, **none**
 1 leading alphabetic character followed by up to 8 alphanumeric characters
none—Action set name does not point to any action set

:ccgt= (optional)

Cancel called global title indicator.

Range: **yes, no**
Default: No change to **ccgt** value

:cdselid= (optional)

CdPA selector ID.

Range: **0-65534 none**
none—deletes the current value of the *cdselid* field
Default: No change to the current value

:cdssn= (optional)

Starting CdPA subsystem number.

Range: **0-255**

:cgcnvsn= (optional)

Calling party conversion set name.

Range: *ayyyyyyy*, **none**
 1 leading alphabetic character and up to 8 following alphanumeric characters.
none—deletes the current value of the parameter

:cggtmod= (optional)

Calling party GT modification indicator. This parameter specifies whether calling party global title modification is required.

Range: **yes, no**
Default: **no**

:cgpc= (optional)

ANSI CgPA point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **cgpc**

Range: **000-255, ***
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
 The asterisk (*) value is not valid for the *ni* subfield.
 When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.
 When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.
 When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.
 When **chg-sid:pctype=ansi** is specified, *ni*-*-* is valid if *ni* = **006-255**.
 The point code **000-000-000** is not a valid point code.

:cgpci= (optional)

ITU international CgPA point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:cgpcn= (optional)

ITU national CgPA point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:cgpcn24= (optional)

24-bit ITU national CgPA point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:cgselid= (optional)

Calling party selector ID.

Range: 0-65534 none

none—deletes the current value of the *cgselid* field

Default: No change to the current value

:cgssn= (optional)

The subsystem number of the start CgPA.

Range: 0-255

:dpc= (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: dpca

Range: 000-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-*-*** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Point Code.

:dpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:ecdssn= (optional)

Subsystem number of the end called party.

Range: 0-255

:ecgssn= (optional)

Subsystem number of the end CgPA.

Range: 0-255

:egta= (optional)

End global title address. This parameter specifies the end of a range of global title digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1-21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: Same as the specified **gta** value

:fallback= (optional)

Fallback option. This parameter specifies the action that is taken if the last translation doesn't match when performing GTT using a FLOBR-specific GTT mode.

Range: **yes, no, sysdflt**

yes — GTT is performed based on the last matched entry

no — GTT fails and the MSU is discarded

sysdflt — The system-wide default fallback option in the SCCPOPTS table is used.

Default: No change to the current value

:family= (optional)

This parameter specifies the ANSI TCAP *family* field in the incoming MSU.

Range: 0-255 *, **none**

*—any valid value in the ANSI TCAP *family* field in the incoming MSU

none—there is no value in the ANSI TCAP *family* field in the incoming MSU

System

Default: **none**

:force= (optional)

Check mated application override.

Range: **yes, no**

Default: **no**

:gta= (optional)

Global title address. This parameter specifies the beginning of a range of global title digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1-21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

:gtmodid= (optional)

Global title modification identifier.

Range: *aaaaaaaa*, **none**

1 leading alphabetic character followed by up to 8 alphanumeric characters

none—removes the association between the translation and the GTMODID

Default: No change to the current value

:loopset= (optional)

SCCP loopset name. This parameter associates a translation set with a loopset.

Range: *ayyyyyyy*, **none**

One leading alphabetic character and up to 7 following alphanumeric characters.

none—Disassociates the translation set from all loopsets.

:mapset= (optional)

MAP set ID. This parameter specifies the Mated Application set ID.

Range: **1-36000** **dflt**

dflt—Default MAP set

:mrnset= (optional)

MRN set ID. This parameter specifies the Mated Relay Node set ID.

Range: **1-3000** **none**, **dflt**

dflt—Default MRN set

none—The GTA translation does not participate in any load sharing.

:opc= (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **opca**

Range: **000-255**, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-*-* is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:opci= (optional)

ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-**, **0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:opcn= (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-**, **0-16383**, **aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

n1-n2-n3-n4—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:opcn24= (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:opcode= (optional)

This parameter specifies the TCAP *opcode* field in the incoming MSU.

Range: 0-255 *, none

*—any valid value in the TCAP *opcode* field in the incoming MSU

none—there is no value in the TCAP *opcode* field in the incoming MSU

:opcsn= (optional)

The new OPC GTT set name.

Range: ayyyyyyyy, none

1 leading alphabetic character and up to 8 following alphanumeric characters.

:optsn= (optional)

Optional GTT set name.

Range: ayyyyyyyy, none

1 leading alphabetic character and up to 8 following alphanumeric characters.

none—deletes the current value of the parameter

:pc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: pca

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:pci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Default: No change to current value.

:pkgtype= (optional)

This parameter specifies the ANSI and ITU TCAP package type.

Range: **ansiuni, qwp, qwop, resp, cwp, cwop, ansiabort, any, cnt, end, ituuni, ituabort, bgn**

ansiuni — ANSI unidirectional

qwp — Query with Permission

qwop — Query without Permission

resp — Response

cwp — Conversation with Permission

cwop — Conversation without Permission

ansiabort — ANSI abort

any — Wildcard value

cnt — Continue

end — End

ituuni — ITU unidirectional

ituabort — ITU abort

bgn— Begin
 ANSI TCAP Package Types—**ansiuni, qwop, qwop, resp, cwp, cwop, ansiabort, any**
 ITU TCAP Package Types—**bgn, ituabort, ituuni, any, end, cnt**

:ppmeasreqd= (optional)
 Per Path Measurement required. This parameter specifies whether to perform per path measurements.
Range: **yes, no**
yes — perform Per Path Measurements
no — do not perform Per Path Measurements
Default: No change to the current value

:ri= (optional)
 Routing indicator.
Range: **gt, ssn**
Default: No change to current value.

:split= (optional)
 Split or change an existing GTA range.
Range: **yes, no**
yes — Splits the existing GTA range.
no — Changes the existing GTA range.
Default: **yes**

:ssn= (optional)
 Subsystem number.
Range: **002-255**
Default: If the **xlat** parameter is not changed to **dpcngt**—No change to current value.
 If the **xlat** parameter is changed to **dpcngt** —The **ssn** parameter value is removed.

:testmode= (optional)
 This parameter invokes a Test Tool that is used to debug the FLOBR/TOBR rules.

CAUTION: If the testmode=on parameter is specified, then the rule is used only by test messages and is ignored by 'live' traffic. If the testmode=off parameter is specified, then both test and live messages use the rule. Changing from testmode=off to testmode=on is equivalent to deleting the rule for live traffic.

Range: **on, off**
on — process the translation rules defined in the test message
off — perform standard GTT behavior
Default: **off**

:xlat= (optional)
 Translate indicator. This parameter is used to specify translation actions and routing actions.
Range: **dpc, dpcngt, dpcssn, none**
Default: No change to the current value

:ngti= (obsolete)
 New GTI code. When the ANSI/ITU SCCP Conversion and AMGTT features are on and the Translated Point Code is of a different network type, this parameter specifies whether the new GTI translation format is GTI type 2 or GTI type 4.
Range: **2, 4**

:nnai= (obsolete)
 New nature of address indicator. This parameter specifies the nature of address indicator that will replace the received nature of address indicator.
Range: **0-127**

Default: If the **rmgtt=no** parameter is specified, there is no change to the current value.
If the **rmgtt=yes** parameter is specified, the value resets to a default of **0**.

:nnp= (obsolete)

New numbering plan. This parameter specifies the numbering plan that will replace the received numbering plan.

Range: **0-15**

Default: If the **rmgtt=no** parameter is specified, there is no change to the current value.
If the **rmgtt=yes** parameter is specified, the value resets to a default of **0xFFFF**.

:npdd= (obsolete)

New prefix digits to be deleted. This parameter specifies the new prefix digits to be deleted that will replace the received prefix digits to be deleted.

Range: **0-21**

Default: If the **rmgtt=no** parameter is specified, there is no change to the current value.
If the **rmgtt=yes** parameter is specified, the value resets to a default of **0xFFFF**.

:npds= (obsolete)

New prefix digits string. This parameter specifies the new prefix digits string that will replace the received prefix digits string.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: If **:rmgtt=no** is specified, no change to current value
If **:rmgtt=yes** is specified, resets to default value of no digits.

:nsdd= (obsolete)

New suffix digits to be deleted. This parameter identifies the new suffix digits to be deleted that will replace the received suffix digits to be deleted.

Range: **0-21**

Default: **0**

:nsds= (obsolete)

New suffix digits string. This parameter specifies the new suffix digits string that will replace the received suffix digits string.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: No digits

:ntt= (obsolete)

New translation type. The point code domain translation types for EGTT are handled by the EAGLE 5 ISS protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I Spare, ITU-N, and ITU-N Spare. ITU-I includes ITU-I Spare, and ITU-N includes ITU-N Spare.

Range: **000-255**

Default: If the **xlat** parameter does not change from **dpcngt**—No change to the current value.
If the **xlat** parameter changes from **dpcngt**—The **ntt** parameter value is removed.

:rmgtt= (obsolete)

Reset MGTT. This parameter resets all GT Modification fields to default values before applying values for other parameters in the command.

Range: **yes, no**

Default: no

Example

```
chg-
gta:gttsn=lidb:gta=9195554321:xlat=dpcssn:ri=ssn:pc=001-255-252:s
sn=254
```

```
chg-
gta:gttsn=test:gta=100000:egta=199999:pca=1-1-1:xlat=dpcngt:ri=gt
:gtmodid=set1
```

```
chg-gta:gttsn=setnat003:gta=987658321198765432102:pcn=s-129
```

```
chg-gta:gttsn=itui1:gta=987658321198765432112:pci=s-1-210-1
```

```
chg-gta:gttsn=setnat003:gta=987658321198765432122:pcn=s-128-aa
```

```
chg-
```

```
gta:gttsn=setmap:gta=2345678911:egta=3456789022:ri=ssn:pc=2-2-2:s
sn=221:mapset=df1t
```

In the following example, the database contains a GTA range [5556000-5558000], but no part of the GTA range [5558001-5559000] exists. The command deletes the GTA range [5556000-5558000] from the database and adds two new GTA ranges [5556000-5556799] and [5556800-5559000].

```
chg-gta:gttsn=tst1:gta=5556800:egta=5559000:split=yes
```

The following command deletes the GTA range [5556000-5556799] from the database and adds a new GTA range [5556200-5556500] to the database. All the parameters for specified GTA range [5556200-5556500] have the same values as that of the deleted [5556000-5556799] GTA range, except the pc parameter that is assigned the specified value of 1-1-2.

```
chg-gta:gttsn=tst1:gta=5556200:egta=5556500:pc=1-1-2:split=no
```

The following command deletes the GTA range [5556200-5556500] from the database and adds two new GTA ranges [5556200-5556400] and [5556401-5556500] to the database.

```
chg-gta:gttsn=tst1:gta=5556401:egta=5556500
```

The following example specifies the default MRN set.

```
chg-gta:gttsn=setmrn:gta=1234567880:pc=1-1-2:mrnset=df1t
```

The following example specifies the mrnset=none parameter to remove the MRN set ID.

```
chg-
```

```
gta:gttsn=setmrn:gta=1234567890:egta=2234567890:pc=1-1-2:mrnset=none
```

```
chg-
```

```
gta:gttsn=setcdgta:gta=123456789012345678901:egta=223456789012345
678901:optsn=cggtal:opcsn=opc1
```

```
chg-
```

```
gta:gttsn=setcdgta:gta=123456789012345678901:egta=223456789012345
678901:cgselid=1024:opcsn=opc1
```

```
chg-
```

```
gta:gttsn=setcdgta:gta=123456789012345678901:egta=223456789012345
678901:optsn=none
```

```
chg-gta:gttsn=setopc:opca=002-001-001:xlat=dpcssn:ri=ssn:
pca=001-001-001:ssn=20:optsn=setcgssn
```

```
chg-gta:gttsn=setcgp:cgpca=001-001-001:xlat=dpcssn:ri=ssn:
pca=001-001-001:ssn=20:optsn=setcgssn
```

```
chg-gta:gttsn=setcgssn:cgssn=100:ecgssn=200:xlat=dpcssn:ri=ssn:
pca=001-001-001:ssn=20
```

```
chg-
```

```
gta:gttsn=set1:gta=2543:egta=2943:actsn=actdisc1:ppmeasreqd=yes
```

```
chg-gta:gttsn=set2:cgpc=1-2-*:actsn=actudts1
```

```
chg-gta:gttsn=set3:opcn=2543:actsn=actudts1
```

```
chg-
```

```

=1-1-1
```

The following example specifies hexadecimal digits for the gta and egta parameters.

```
chg-gta:gttsn=set1:gta=abcd:egta=abce
```

```
chg-
```

```
gta:gttsn=setmap:gta=2345678901:egta=3456789012:ri=ssn:pc=1-1-3:s
sn=225:mapset=2:loopset=raleigh1
```

The following example specifies that calling party GT modification is required.

```
chg-gta:gttsn=setans004:cggmod=yes:gta=981234
```

The following example changes the GTA translations when the FLOBR feature is turned on.

```
chg-gta:gttsn=setcdgta:gta=1234567890:egta=2234567890:
xlat=dpcssn:ri=ssn:pca=001-001-001:ssn=100:fallback=no:testmode=on
```

The following example changes the GTA translations when the OBSR feature is enabled and the FLOBR feature is turned on.

```
chg-gta:gttsn=setcdgta:gta=1234567890:egta=2234567890:
xlat=dpcssn:ri=ssn:pc=2-2-2:ssn=100:fallback=yes:optsn=setcggta:t
estmode=on
```

The following example changes the GTA translations when the FLOBR feature is turned on.

```
chg-gta:gttsn=setcdssn:cdssn=15:ecdssn=29:xlat=dpc:pc=1-1-1:ri=gt
```

The following example changes the GTA translations when the TOBR and OBSR features are turned on.

```
chg-
```

```
gta:gttsn=setopcode:pkgtype=qwop:opcode=none:family=*:xlat=dpc:ri
=gt:pc=2-2-2:opcsn=setopc:optsn=setcdgta
```

```
chg-
```

```
gta:gttsn=setopcode:pkgtype=bgn:opcode=none:acn=1-22-123-43-54-65
-76:xlat=dpc:ri=gt:pc=2-2-2:opcsn=setopc:optsn=setcdgta
```

The following example changes the GTA translation for a DPC GTT set when the FLOBR feature is turned on.

```
chg-gta:gttsn=setdpc:dpc=1-1-1:optsn=setc1
```

```
chg-gta:gttsn=setcdgta:gta=78901234:xlat=dpc:gtmodid=none
```

```
chg-
```

```
gta:gttsn=setcdgta:gta=123456789012345678901:xlat=none:gtmodid=gt
tsn1
```

```
chg-
```

```
gta:gttsn=setopcode:pkgtype=bgn:opcode=none:acn=1-2-3-4-5-6-7:sla
t=none:mapset=1
```

```
chg-gta:gttsn=setcdgta:gta=123456:xlatt=none:mapset=1:mrnset=2
```

Dependencies

The EGTT feature must be turned on before this command can be entered.

The ANSI/ITU SCCP Conversion feature must be enabled before a translated point code that is of a different domain than the GTT set specified by the **gttsn** parameter can be specified.

At least one optional parameter must be specified.

The **gttsn** parameter cannot have a value of **none**.

The point code specified for the **pc** parameter must be a full point code.

If the **egta** parameter is specified, the values of the **gta** and **egta** parameters must be the same length.

If the specified or previously provisioned translated point code is of type ANSI, then the **ngti** value of the referred GT Modification Identifier (see the **ent-gtmod** command) must be **2**.

The length of the specified **gta** parameter must match the number of digits provisioned for the specified GTT set when the VGTT feature is turned off. If the VGTT feature is turned on, then up to 10 GTA lengths can exist per GTT set. If the Support for 16 GTT Lengths in VGTT feature is turned on, then up to 16 GTA lengths can exist per GTT set.

The specified **gta/egta** range must exist for the specified GTT set in the STP active database. While an exact match is not required, an overlap with another range cannot be specified. If the range overlaps, an error is generated that displays a list of overlapped global title addresses. An example follows that shows what happens when the user attempts to enter a range (such as 8005550000 to 8005559999) that overlaps an existing range. The overlapping links must match. If they do not, error message E2401 is generated displaying the list of overlapped global title addresses:

The following GTA ranges overlap the input GTA range

```
START GTA END GTA
8005550000 8005551999
8005552000 8005553999
8005554000 8005555999
CHG-GTA: MASP A - Command Aborted
```

If a new or existing **xlatt=dpnct** parameter is specified, a new or existing **ri=gt** parameter must be specified.

If the **ssn** parameter is specified, a new or existing **xlatt=dpssn** parameter must be specified.

If the **xlatt=dpssn** parameter is specified, the **ssn** parameter must be specified.

If the **pc/pca/pci/pcn/pcn24** parameter is specified, and the point code is the STP true point code, then the value of the new or existing **xlatt** parameter must be **dpssn**, and the new or existing value of the **ri** parameter must be **ssn**.

If the **pc/pca/pci/pcn/pcn24** parameter, **ssn** parameter, or both, are specified, and the point code is the STP true point code, the **ssn** value must exist in the SS-APPL table.

If the **pc/pca/pci/pcn** parameter is specified, then it must exist as a destination in the Route table or reside in a cluster that exists as a destination in the Route table (for global routing) unless the point code is the STP's true point code.

If new or existing **ri=ssn** and **xlatt=dpct** parameters are specified, and the **pc/pca/pci/pcn/pcn24** parameter is not specified, then the existing PC must exist in the Remote Point Code/MAP table, unless the **force=yes** parameter is specified.

If new or existing **ri=ssn**, **xlat=dpc**, and **pc/pca/pci/pcn/pcn24** parameters are specified, the new point code must exist in the Remote Point Code/MAP table, unless the **force=yes** parameter is specified.

If a new or existing **ccgt=yes** parameter is specified, a new or existing **ri=ssn** parameter must be specified.

If a new or existing **ri=gt** parameter is specified, a new or existing **ccgt=no** parameter must be specified.

If the new or existing **pc/pca/pci/pcn/pcn24** parameter is an the STP point code or capability point code, then the **ccgt=no** parameter must be specified.

If new or existing **ri=ssn** and **xlat=dpcssn** parameters are specified, a new or existing **xlat=dpcssn** parameter must exist in the Remote Point Code/MAP table, unless the **force=yes** parameter is specified.

The GTT table cannot be full.

If the **ri=gt** parameter is specified, the **mrnset** parameter must be specified. If the **ri=gt** parameter is not specified, the **mrnset** parameter cannot be specified

If the Flexible GTT Load Sharing feature is enabled, the specified PC must already exist in the specified MRN set.

The specified MRN set must already exist in the MRN table.

If the Flexible GTT Load Sharing feature is enabled, the specified PC must exist in the MRN set.

The Flexible GTT Load Sharing feature must be enabled before the **mrnset** parameter can be specified.

If the **ri=gt** parameter is specified, the **mrnset** parameter must be specified. If the **ri=ssn** parameter is specified, the **mrnset** parameter cannot be specified.

The SEAS command can operate only on the default MRN set or the default MAP set.

If the **ri=ssn** parameter is specified, the **mapset** parameter must be specified. If the **ri=gt** parameter is specified, the **mapset** parameter cannot be specified. Note: The **mapset** parameter can only be specified if the Flexible GTT Load Sharing feature is enabled.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

The specified MAP set must exist in the database.

The specified or previously provisioned PC/SSN must exist in the specified or previously provisioned MAP set.

The SEAS command cannot operate on any MAP set other than the default MAP set.

If the **xlat=dpc** parameter is specified, and the value of the **force** parameter is not **yes**, then the point code and MAP set must exist in the MAP table.

The specified GTA must occur within an existing GTA range in the specified GTT Set.

The **gta**, **cgpc/cgpcac/cgpci/cgpcn/cgpcn24**, **opc/opca/opci/opcn/opcn24**, **cgssn/cdssn**, **opcode/acn/pkgtype**, **opcode/family/pkgtype**, or **dpc/dpca/dpci/dpcn/dpcn24** parameter must be specified.

The FLOBR feature must be turned on before the **cgssn**, **opcsn**, **optsn**, and **cgselid** parameters can be specified in the same command.

The **pc/pca/pci/pcn/pcn24**, **cgpc/cgpcac/cgpci/cgpcn/cgpcn24**, **opc/opca/opci/opcn/opcn24**, and **dpc/dpca/dpci/dpcn/dpcn24** parameters must have values within the valid range for each subfield.

If the **ecgssn/ecdssn** parameter is specified, its value must be greater than the value of the **cgssn** / **cdssn** parameter.

The specified GTT set must have a set type of **opcode** (see the **ent-gttset** command) before the **opcode/acn/pkgtype** or **opcode/family/pkgtype** parameters can be specified. The specified GTT set must have a set type of **cdssn**, **cgssn**, **cdgta/cgta**, **opc**, or **cgpc** before the **cdssn**, **cgssn**, **gta**, **opc**, or **cgpc** parameter, respectively, can be specified.

The OBSR feature must be enabled before the **opcsn**, **cgpc/cgpca/cgpci/cgpcn/cgpcn24**, **opc/opca/opci/opcn/opcn24**, or **(e)cgssn** parameters can be specified.

If the GTT set specified by the **gttsn** parameter (GTTSN set) has a set type of **cdgta** (see the **ent-gttset** command), then the **optsn** parameter cannot specify a GTT set (OPTSN set) with a set type of **cgssn**. The OPTSN set must have a set type of **cggta** or **cgpc**. The FLOBR feature must be turned on before a GTTSN set with a set type of **cgpc**, **cggta**, or **opc** can be specified with an OPTSN with a set type other than **cgssn**. If the FLOBR feature is turned on, and the GTTSN set has a set type of **cdgta** or **cdssn**, then the OPTSN set cannot have a set type of **opc**. If the TOBR feature is turned on, and the GTTSN set has a set type of **opcode**, then the OPTSN set cannot have a set type of **opc**.

The **cdselid**, **cgselid**, and **optsn** parameters cannot be specified together in the command. If the GTTSN has a set type of **cdgta**, **cdssn**, or **opcode** (see the **ent-gttset** command) then the **opcsn** parameter can be specified if one of the other exclusive parameters is specified.

The **gta** parameter must be specified if the GTTSN set type has a value of **cdgta** or **cggta**. The **gta** parameter cannot be specified for other set types.

The **cgpc/cgpca/cgpci/cgpcn/cgpcn24** parameter must be specified if the GTTSN set type has a value of **cgpc**. The **cgpc/cgpca/cgpci/cgpcn/cgpcn24** parameter cannot be specified for other set types.

The **opc/opca/opci/opcn/opcn24** parameter must be specified if the GTTSN set type has a value of **opc**. The **opc/opca/opci/opcn/opcn24** cannot be specified for other set types

The **cgssn** parameter must be specified if the GTTSN set type is **cgssn**. The **cgssn** parameter cannot be specified for other set types

The range specified by the **cgssn/ecgssn** and **cdssn/ecdssn** parameters cannot overlap a currently existing range for the specified GTT set.

The GTT set specified by the **opcsn** parameter must have a set type of **opc** (see the **ent-gttset** command).

If the specified GTT set is an ANSI set, the **cgpc/cgpca**, **opc/opca**, and **dpc/dpca** parameters must be valid ANSI point codes. If the specified GTT set is an ITU set, the **cgpci/cgpcn/cgpcn24**, **opci/opcn/opcn24**, and **dpci/dpcn/dpcn24** parameters must be valid ITU point codes.

The set domain of the **opcsn** parameter must be the same as the set domain of the **gttsn** parameter. For example, if the set domain of the **gttsn** parameter is ANSI, then the set domain of the **opcsn** parameter must be ANSI. If the set domain of the **gttsn** parameter is ITU, then the set domain of the **opcsn** parameter must be ITU.

The range specified by the **cgssn/ecgssn** and **cdssn/ecdssn** parameters must exist for the specified GTT set in the STP active data base. An exact match is not required.

The translation entry associated with the specified point code (**dpc/dpca/dpci/dpcn/dpcn24**, **pc/pca/pci/pcn/pcn24**, or **opc/opca/opci/opcn/opcn24**) or **opcode** must already exist.

The **cgpc**, **cgssn**, **gta**, **opc**, **cdssn**, and **opcode** parameters cannot be specified in the same command. If the **cgssn** and **cdssn** parameters are both specified in the same command (in any order), then only the value for the last of the two parameters specified is used during processing.

The Hex Digit Support for GTT feature must be turned on before hexadecimal digits can be specified for the **gta** or **egta** parameters.

The SCCP Loop Detection feature must be enabled before the **loopset** parameter can be specified.

The value of the **loopset** parameter must already exist in the database.

If the **egta** parameter is specified, the value of the **egta** parameter must be greater than value of the **gta** parameter.

The value specified for the **pc** parameter cannot be associated with a proxy point code.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the **cggtmod** parameter can be specified.

The FLOBR feature must be turned on before the **fallback**, **cdselid**, **(e)cdssn**, or **dpc** parameter can be specified.

The FLOBR feature must be turned on before the **gttsn** parameter can specify a GTT set with a set type other than **cdgta** (see the **ent-gttset** command) in the same command with the **cgtselid** parameter.

The OBSR feature must be enabled or the FLOBR feature must be turned on before the **cgtselid** parameter can be specified.

The same value cannot be specified for the **gttsn** and **optsn** parameters.

The ANSI/ITU SCCP Conversion feature must be enabled before the GTT set specified by the **optsn** parameter can have a different domain than the GTT set specified by the **gttsn** parameter.

A TOBR quantity feature must be turned on before the **opcode**, **pkgtype**, **acn**, or **family** parameter can be specified.

The **opcode**, **pkgtype**, and **family** parameters must be specified together for ANSI TCAP translations. The **opcode**, **pkgtype**, and **acn** parameters must be specified together for ITU TCAP translations.

If the GTT set specified by the **gttsn** parameter has a set type of **opcode** (see the **ent-gttset** command), then the **opcode/acn/pkgtype** or **opcode/family/pkgtype** parameters must be specified. These parameters cannot be specified if the GTT set has of any other set type.

If the GTT set specified by the **gttsn** parameter has a set type of **cdssn** (see the **ent-gttset** command), then the **cdssn** parameter must be specified. This parameter cannot be specified if the GTT set has of any other set type.

The **opcsn** parameter can be specified only if the GTT set specified by the **gttsn** parameter has a set type of **cdgta**, **opcode**, or **cdssn** (see the **ent-gttset** command).

The value specified for the **gttsn** parameter must match the name of an existing GTT Set.

A value of **none** must be specified for the **optsn**, **cgtselid**, or **cdselid** parameter before the parameter can be changed to another value.

The ANSI/ITU SCCP Conversion feature must be enabled and the FLOBR feature must be turned on before the **cgcnvsn** parameter can be specified.

The GTT set specified by the **gttsn** parameter must have a set type of **cdgta** or **cggta** (see the **ent-gttset** command), before the **cgcnvsn** parameter can be specified.

The value specified for the **gttsn** parameter cannot be the same as the value specified for the **cgcnvsn** parameter.

If the **family** parameter is specified, then the **pkgtype** parameter must have a value of **ansiuni**, **qwp**, **qwop**, **resp**, **cwp**, **cwop**, **ansiabort** or **any**.

If the **acn** parameter is specified, then the **pkgtype** parameter must have a value of **bgn**, **ituabort**, **ituuni**, **any**, **end**, or **cnt**.

The **gttsn** parameter must be specified and must match an existing GTT set.

The GTT set name specified in the **optsn**, **opcsn**, or **cgcnvsn** parameters must match an existing GTT set name.

If the **pkgtype=ituabort** parameter is specified, then a value of **none** must be specified for the **acn** and **opcode** parameters. If the **pkgtype=ansiabort** parameter is specified then a value of **none** must be specified for the **family** and **opcode** parameters.

The OBSR feature must be enabled or the FLOBR feature must be turned on before the **optsn** parameter can be specified.

The GTT Action Set specified by the **actsn** parameter must already exist in the database.

If the GTT set specified by the **gttsn** parameter has a set type of **dpc** (see the **ent-gttset** command), then the **dpc/dpca/dpci/dpcn/dpcn24** parameter must be specified. If the GTT set has a set type other than **dpc**, then the **dpc/dpca/dpci/dpcn/dpcn24** parameter cannot be specified.

The value specified for the **gtmodid** parameter must already exist in the GTMOD table (see the **ent-gtmod** command).

The values specified for the **gta** and **egta** parameters must be an exact match to the GTA values referred in GTT Action Path table (see the **ent-gttapath** command).

If the FGTTLS feature is enabled, and the **xlat=none** parameter is specified, then the **mrnset** or **mapset** parameter must be specified.

If the **xlat=none** parameter is specified, then the **ri**, **pc/pca/pci/pcn/pcn24**, **force**, **ssn**, and **ccgt** parameters cannot be specified.

The **acn** and **family** parameters cannot be specified together in the command.

If the **cgssn** parameter is specified, then the **(e)cdssn** parameter cannot be specified. If the **cdssn** parameter is specified, then the **(e)cgssn** parameter cannot be specified.

If the **opc** or **dpc** parameter is specified, then the **(e)gta**, **(e)cgssn**, **(e)cdssn**, and **opcode** parameters cannot be specified.

Notes

The maximum length of the resulting GTA string must not exceed 21 digits when translation is complete.

If a GTT is being deleted or changed and the point code (**dpc** or **rte**) is not found in the route table (unless the point code is the STP's true point code), then the following message is displayed in the terminal scroll area:

```
NOTICE: No DPC and/or RTE found for GTT being deleted or changed.
```

The above situation may occur for the following reasons:

- A database was upgraded from a release prior to EAGLE 5 ISS Release 27.1 or IP⁷ Secure Gateway Release 3.0 when GTT entries were not linked to the route table and the deletion of the **dpc** was permitted. The GTT referenced a **dpc/rte** that was deleted, and the enforce reference counts between the GTT and route tables were not updated.
- A serious problem occurred in which the reference count rules were not enforced and a **dpc** and/or **rte** were deleted while being referenced by a GTT entry. This indicates a software error; notify the Customer Care Center at (888) FOR-TKLC.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix **s-** and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

When the Flexible GTT Load Sharing feature and the Intermediate GTT Load Sharing feature are on, multiple relationships can be defined among a set of destination point codes in the existing MRN table. The relationship used in a particular translation is based on the GTA digits used for translation. The **mrnset** parameter and the post-translation PC create a key that is used to perform a lookup in the MRN table. This lookup results in a set of alternate PCs, from which a PC is selected, based on relative cost, to route the MSU in most cost-effective way.

When the Flexible GTT Load Sharing feature is turned on, multiple relationships can be defined among a set of PC/SSN pairs in the existing MAP table. The relationship used in a particular translation is based on the GTA digits used for translation.

When the Origin-based SCCP Routing feature is enabled, the CdPA GTA entry can be provisioned in addition to the CgPA GTA, CgPA PC, CgPA SSN, and OPC entries. When provisioning, the Advanced CdPA GTA entry can associate with the CgPA GTA set or the CgPA PC set, the SELID and/or OPC set; the CgPA GTA, CgPA PC, or OPC can associate with the CgPA SSN set; the CgPA SSN cannot associate with any other GTT set. The Advanced CdPA GTA entry may contain the selector ID along with CgPA information present in the MSU to search the Selector table again for the CgPA GTA or CgPA PC Set.

A loopset consists of a set of point codes that form a routing loop in the network. If the SCCP Loop Detection feature is enabled, then the loopset can be associated with or disassociated from specified translation entries. Loopsets that are associated with translation entries are checked during intermediate and final GTT traffic routing. If a loop exists, then the system can be notified with or without discarding the associated traffic.

The maximum length of the resulting GTA string must not exceed 21 digits when translation is complete.

If the range specified by the **gta** and **egta** parameters does not exactly match the existing range, then the existing range is split. All addresses in the existing range that are outside the range specified by the **gta** and **egta** parameters retain the original **xlat**, **ri**, **pc**, and **ssn** parameters. A new range is created that is bounded by the **gta** and **egta** parameters. The new range contains new values for the **xlat**, **ri**, **pc** and **ssn** parameters that are present in the command, while retaining parameter values from the previous range that do not have corresponding new values in the command.

If the FLOBR GTT hierarchy is provisioned on a linkset, then translations do not have to be searched in a predetermined manner. If a translation points to another GTTSET/SELID, then database searches continue. The number of searches is limited by the following conditions:

- The same GTT set name cannot be referred more than once.
- Up to 7 database searches can be performed.

If the FLOBR feature is turned on, then any translation can point to any GTTSETs other than that specified by the GTTSN. The CdPA GTA and CdPA SSN translations can also point to an OPCS. For CdPA GTA and CdPA SSN translations, if an OPTSN GTTSET/SELID is provisioned apart from an OPCS, then the OPTSN GTTSET/SELID takes precedence over the OPCS.

Translations associated with the TOBR feature:

- ANSI Opcode—ANSI opcode specifier, ANSI TCAP Package type, and Family
- ITU Opcode—ITU opcode, ITU TCAP Package Type, and ACN

Translations associated with the FLOBR feature:

- CdPA SSN Translations—Can be configured with routing and flexible routing data. The provisioning rules for CdPA SSN translations are the same as CgPA SSN translations in OBSR.
- DPC Translations—The provisioning rules for DPC translations are the same as OPC translations except that OPCS parameter can not be configured for DPC translations.

chg-gtcnv**Change Global Title Conversion**

Use this command to change entries in the Default Global Title Conversion table. A table entry is identified by the direction and either the **tta** parameter, the **tti** parameter, or the **tti/np/nai** parameter combination. The Notes section for this command describes rules for changing entry information.

Keyword: **chg-gtcnv**

Related Commands: **dlt-gtcnv, ent-gtcnv, rtrv-gtcnv**

Command Class: Database Administration

Parameters

:dir= (mandatory)

Direction of conversion.

Range: **atoi, itoa, both**

atoi—ANSI to ITU conversion

itoa—ITU to ANSI conversion

both—Conversion in both directions

:nai= (optional)

Nature of address indicator. This parameter is mandatory when **gtixlat=24** is specified, and cannot be specified when **gtixlat=22** is specified.

Range: **0-63 ***

Default: No change to current value

:np= (optional)

Numbering plan. This parameter is mandatory when **gtixlat=24** is specified, and cannot be specified when **gtixlat=22** is specified.

Range: **0-15 ***

Default: No change to current value

:npdd= (optional)

New prefix digits to be deleted. This parameter specifies the number of new prefix digits to be deleted. These digits will be replaced with the new prefix digits string (**npds**).

Range: **0-21**

Default: No change to current value

:npds= (optional)

New prefix digits string. This parameter specifies the new prefix digits string that will replace the received prefix digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: No change to current value

- :nsdd=** (optional)
 New suffix digits to be deleted. This parameter specifies the number of new suffix digits to be deleted. These digits will be replaced with the new suffix digits string (**nsds**).
Range: 0-21
Default: No change to current value
- :nsds=** (optional)
 New suffix digits string. This parameter specifies the new suffix digits string that will replace the received suffix digits.
Range: 1-21 digits
 If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.
 If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.
Default: No change to current value
- :rdmod=** (optional)
 Reset digit modifiers (**npdd** and **npds** or **nsdd** and **nsds**) values to "no digit modification."
Range: yes, no
yes—Reset the **npdd** and **npds** parameter or **nsdd** and **nsds** parameter values.
no—Do not reset the **npdd** and **npds** parameter or **nsdd** and **nsds** parameter values.
Default: No change to current value
- :tta=** (optional)
 ANSI translation type. This parameter is mandatory when **dir=atoi** or **dir=both** is specified.
Range: 0-255 *
Default: No change to current value
- :tti=** (optional)
 ITU translation type. This parameter is mandatory when **dir=atoi** is specified.
Range: 0-255 *
Default: No change to current value

Example

The following example changes a **dir=atoi** entry's current **tta** value to 5.

```
chg-gtcnv:dir=atoi:tta=10:tti=5
```

The following example changes a **dir=atoi** entry's current **tta**, **nai**, and **np** values to 7, 8, and 6 respectively, and either changes or adds the **nsdd** and **nsds** values.

```
chg-gtcnv:dir=atoi:tta=11:tti=7:nai=8:np=6:nsdd=3:nsds=123
```

The following example changes a **dir=itoa** entry's current **tta** value to 11, and either changes or adds the **npdd** and **npds** values.

```
chg-gtcnv:dir=itoa:tta=11:tti=7:npdd=3:npds=123
```

The following example changes a **dir=itoa** entry's current **tta** value to 12, and either changes or adds the **nsdd** and **nsds** values.

```
chg-gtcnv:dir=itoa:tta=12:tti=7:nai=8:np=6:nsdd=5:nsds=45667
```

The following example adds or changes a **dir=both** entry's **nsdd** and **nsds** values.

```
chg-gtcnv:dir=both:tta=12:tti=33:nsdd=3:nsds=456
```

The following example changes a default **dir=atoi** entry's current **tti** value to 9, and either changes or adds the **nsdd** and **NSDS** values.

```
chg-gtcnv:dir=atoi:tta=*:tti=9:nsdd=1:nsds=9
```

The following example changes a default `dir=atoi` entry's current `tta`, `nai`, and `np` value to 4, 6, and 5 respectively.

```
chg-gtcnv:dir=atoi:tta=*:tti=4:nai=6:np=5
```

The following example changes a default `dir=ittoa` entry's current `tta` value to 17, and either changes or adds the `npdd` and `npds` values.

```
chg-gtcnv:dir=ittoa:tta=17:tti=*:nai=*:np=*:npdd=3:npds=123
```

The following example resets existing `npdd/npds` or `nsdd/nsds` values to "no digit modification."

```
chg-gtcnv:dir=both:tta=12:tti=11:rdmod=yes
```

The following example specifies hexadecimal digits for the `nsds` parameter.

```
chg-gtcnv:dir=atoi:tta=*:tti=4:npdd=3:npds=abc1234fed
```

Dependencies

The ANSI/ITU SCCP Conversion feature must be enabled before this command can be entered.

If the `dir=atoi` parameter is specified, then the `tta` parameter must be specified.

If the `dir=both` parameter is specified, then the `tta` and `tti` parameters must be specified.

If the `dir=both` parameter is specified, then a wildcard value (*) cannot be specified for any of the other parameters.

If the `dir=atoi` parameter is specified, then a wildcard value (*) can be specified only for the `tta` parameter.

If the `dir=ittoa` parameter is specified, then a wildcard value (*) must be specified for the `tti`, `np`, and `nai` parameters.

If the `dir=ittoa` and `gtixlat=22` parameters are specified, then wildcard values (*) cannot be specified. The `dir=ittoa` and `gtixlat=24` parameters must be specified before wildcard values can be specified.

The specified `dir`, `tta`, `tti`, `np`, and `nai` parameter combination cannot already exist in the database.

The `nsdd/nsds` and the `npdd/npds` parameters cannot be specified together in the command.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the `npds` and `nsds` parameters.

Notes

The use of asterisks (wildcards) is allowed only once for each direction of ANSI to ITU and ITU to ANSI. This provides a configurable default.

In the conversion direction of ANSI to ITU, an asterisk can be specified only for the ANSI `tta` parameter.

In the conversion direction of ITU to ANSI, the asterisk value must be specified for the `itua tti`, `np`, and `nai` parameters.

Asterisks are not allowed when conversion is in both directions (`dir=both`).

The suffix digit manipulation parameters `nsdd` and `nsds` cannot be specified in the same command with the prefix digit manipulation parameters `npdd` and `npds` parameters. The `npdd` and `nsdd` parameters specify how many digits to delete, if any, from the beginning or end respectively of the Global Title address digits. The `npds` and `nsds` parameters specify what digits, if any, to append to the beginning or end respectively of the Global Title address digits.

The `gtixlat` parameter is expressed in the form of the ANSI GTI and the ITU GTI. The `gtixlat` parameter is used to indicate the conversion of the Global Title Indicator between the ANSI and ITU standards. For example: A `gtixlat` value of `24` converts an incoming ANSI GTI2 to an outgoing ITU GTI 4 or an incoming ITU GTI 4 to an outgoing ANSI GTI2.

Output

```

chg-gtcnv:dir=atoi:gtixlat=22:tta=10:tti=5

chg-gtmod**Change GT Modification Data**

Use this command to change GT Modification (GTMOD) entry data. The GTMOD entry consists of a GTMOD ID and GTMOD specific data.

Keyword: **chg-gtmod**

Related Commands: **dlt-gtmod, ent-gtmod, rtrv-gtmod**

Command Class: Database Administration

Parameters

NOTE: Definitions for the feature options specified by the on and off parameters are located in the Notes section.

:gtmodid= (mandatory)

GT Modification Identifier.

Range: *ayyyyyyy*

1 alphabetic character followed by up to 8 alphanumeric characters

:cgpassn= (optional)

Calling party subsystem number. This parameter specifies the calling party subsystem address that receives the message.

Range: **2-255, none**

Default: No change to the current value

:ngti= (optional)

New Global Title Indicator. This parameter specifies whether a new GTI translation format is type 2 or type 4.

Range: **2, 4, none**

Default: No change to the current value

:ngtmodid= (optional)

New GT Modification Identifier.

Range: *ayyyyyyy*

1 alphabetic character followed by up to 8 alphanumeric characters

:nnai= (optional)

New nature of address indicator. This parameter specifies the value that is used to replace the received NNAI.

Range: **0-127, none**

Default: **none** - if the **ngti** parameter has a value of **2**. Otherwise, no change to the current value.

:nnp= (optional)

New numbering plan. This parameter specifies the value that is used to replace the received numbering plan.

Range: **0-15, none**

Default: **none** - if the **ngti** parameter has a value of **2**. Otherwise, no change to the current value.

:npdd= (optional)

Number of prefix digits to be deleted. This parameter specifies the number of digits to be deleted from the prefix of the received GT address.

Range: 1-21, none

Default: No change to the current value

:npds= (optional)

New prefix digits string. This parameter specifies the digits to be prefixed to the received GT address.

Range: 1-21 digits, none

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: No change to the current value

:nsdd= (optional)

Number of suffix digits to be deleted. This parameter specifies the number of digits to be deleted from the suffix of the received GT address.

Range: 1-21, none

Default: No change to the current value

:nsds= (optional)

New suffix digits string. This parameter specifies the digits to be suffixed to the received GT address.

Range: 1-21 digits, none

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: No change to the current value

:ntt= (optional)

New Translation Type. This parameter specifies the value that replaces the received Translation Type.

Range: 0-255, none

Default: No change to the current value

:off= (optional)

Turns off the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned off. Up to 8 feature options can be specified in the list.

Range: gt0fill

:on= (optional)

Turns on the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned on. Up to 8 feature options can be specified in the list.

Range: gt0fill

:precd= (optional)

Precedence. This parameter specifies whether the prefix or suffix takes precedence during modification of the received GT address.

Range: pfx, sfx

Default: pfx - if the **npdd** and **npds** parameters are specified

sfx - if the **nsdd** and **nsds** parameters are specified

Example

```
chg-
gtmod:gtmodid=set2:ngti=4:nnp=4:nnai=2:off=gt0fill:npds=2:prec=s
fx:nsds=1

chg-gtmod:gtmodid=set3:on=gt0fill:nnp=7:nnai=100:nsdd=2:ntt=none
```

Dependencies

If the **ngti=4** parameter is specified, then the **nnp** and **nnai** parameters must be specified.

If the **ngti=2** parameter is specified, then the **nnp** and **nnai** parameters cannot be specified.

The ANSI/ITU SCCP Conversion feature must be enabled before the **ngti** parameter can be specified.

The Hex Digit Support for GTT feature must be turned on before hexadecimal digits can be specified for the **npds** or **nsds** parameter.

At least one optional parameter must be specified.

The AMGTT, AMGTT CdPA Only, or AMGTT CgPA Upgrade feature must be turned on before any parameter except the **ntt** parameter can be specified.

The value specified for the **gtmodid** parameter must already exist in the GTMOD table.

If the **npdd/npds** and **nsdd/nsds** parameters are specified or were previously provisioned, then the **prec** parameter must be specified.

The combined digit length of the values for the specified or previously provisioned **npds** and **nsds** parameters cannot be greater than 21.

The **(n)gtmodid=none** parameter cannot be specified.

If the **ngti=4** parameter is specified, then the referred translated point code cannot be ANSI. For ANSI point codes, the **ngti** value must be **2**.

If the **ngti=4** parameter is specified or was previously provisioned, then a value of **none** cannot be specified for the **nnp** and **nnai** parameters.

If the **ngti=none** parameter is specified, then the **on=gt0fill** parameter cannot be specified.

If the **on=gt0fill** parameter is specified, then the **ngti** parameter must be specified.

The value specified for the **ngtmodid** parameter cannot already exist in the database.

The same value cannot be specified for the **on** and **off** parameters.

Notes*on/off options*

- **gt0fill**—GT zero fill. Specifies whether the last 0 of the GTA is a treated as a valid digit (OFF) or as filler (ON) during GT Modification for the gti(x)=2 to gti(x)=4 scenario.

Output

```
chg-gtmod:gtmodid=gtmodid2:ngti=4:nnp=4:nnai=2:off=gt0fill
tekelecstp 10-03-18 14:43:31 EST EAGLE 42.0.0
Command entered at terminal #4

GTMOD table is (2 of 50000) 1% full

CHG-GTMOD: MASP A - COMPLTD
;
```

Use this command to change the routing objects for messages requiring global title translation. The global title addresses remain unchanged.

NOTE: If the EGTT feature is turned on, then the GTT Selector (ent/chg/dlt/rtrv-gttssel), GTT Set (ent/dlt/rtrv-gttset), and GTA (ent/chg/dlt/rtrv-gta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is on.

Keyword: chg-gtt

Related Commands: dlt-gtt, ent-gtt, rtrv-gtt

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

NOTE: As of Release 42.0, the ntt, ngti, nnai, nnp, npdd, npds, nsdd, nsds, and rmgtt parameters are obsolete for this command. These parameters will be provisioned using the ent/chg-gtmod commands.

:gta= (mandatory)

Global title address. This parameter specifies the beginning of a range of global title digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

:cggtmod= (optional)

Calling party GT modification indicator. This parameter specifies whether calling party global title modification is required.

Range: yes, no

Default: no

:egta= (optional)

End global title address. This parameter specifies the end of a range of global title digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: egta same as gta

:gtmodid= (optional)

Global title modification identifier.

Range: ayyyyyyy, none

1 alphabetic followed by up to 8 alphanumeric characters

Default: No change to the current value

:loopset= (optional)

SCCP loopset name. This parameter associates a translation set with a loopset.

Range: ayyyyyyy, none

1 alphabetic character followed by up to 7 alphanumeric characters.

none—Disassociates the translation set from all loopsets.

:mapset= (optional)

MAP set ID. This parameter specifies the Mated Application set ID.

Range: **1-36000 dflt**
dflt—Default MAP set

:mrnset= (optional)

MRN set ID. This parameter specifies the Mated Relay Node set ID.

Range: **1-3000 none, dflt**
dflt—Default MRN set
none—The GTT translation does not participate in any load sharing

:pc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **pca**

Range: **p-, 000-255**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—**p-**
When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.
When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.
When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.
The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (optional)

Point code.

:pci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—**s-, p-, ps-**
zone—**0-7**
area—**000-255**
id—**0-7**
The point code **0-000-0** is not a valid point code.

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—**s-, p-, ps-**
nnnnn—**0-16383**

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)* The *prefix* subfield indicates a private point code *prefix-ni-nc-ncm.(prefix-ni-nc-ncm)*.

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

msa—000-255

ssa—000-255

sp—000-255

:ri= (optional)

Routing Indicator. This parameter provides routing instructions to the receiving signaling point. In gateway screening, messages may be screened based on the value of the routing indicator.

Range: **gt, ssn**

gt — Allow a called party address with a routing indicator value of **global title**.

ssn — Allow a called party address with a routing indicator value of **dpc/ssn**.

Default: No change in current value.

:split= (optional)

Split or change an existing GTA range.

Range: **yes, no**

yes — Split the existing GTA range.

no — Change the existing GTA range.

Default: **yes**

:ssn= (optional)

Subsystem number.

Range: **002-255**

Default: If the **xlat=dpcngt** parameter is specified, there is no change to the current value.

If the **xlat=dpcngt** parameter is not specified, the **ssn** parameter is removed.

:ttn= (optional)

Translation type name.

Range: *ayyyyyyy*

1 alphabetic character followed by up to 8 alphanumeric characters

Default: No translation name is given

:type/typea/typei/typen/typen24/typeis/typens= (optional)

Translation type. This parameter identifies the translation type and network type. This parameter is the decimal representation of the 1-byte field used in SS7.

The **type** and **typea** parameters specify an ANSI network.

The **typei** parameter specifies an ITU-international network.

The **typen** parameter specifies an ITU-national network.

The **typen24** parameter specifies a 24-bit ITU-national network.

The **typeis** parameter specifies an ITU-international spare network.

The **typens** parameter specifies an ITU-national spare network.

A translation type numeric value may be entered as ANSI type (**type** or **typea**) and as an ITU type (**typei/typep/typep24/typeis/typens**). However, they are separate entities.

The point code domain translation types for GTT are handled by the EAGLE 5 ISS protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I spare, ITU-N, ITU-N spare, and ITU-N24.

Range: 0-255

Default: No translation type is specified

:xlat= (optional)

Translate indicator. This parameter specifies translation actions and routing actions.

Range: dpc, dpcssn, dpcngt

Default: No change in current value.

:ngt= (obsolete)

New global title

Range: 000-255

Default: If the value for the **xlat** parameter changes from **dpcngt**, the **ngt** parameter is removed. If the value for the **xlat** parameter does not change from **dpcngt**, there is no change to the **ngt** parameter value.

:ngti= (obsolete)

New GTI code. When the ANSI/ITU SCCP Conversion and AMGTT features are ON and the Translated Point Code is of a different network type, the **ngti** parameter specifies whether the new GTI translation format is GTI type 2 or GTI type 4.

Range: 2, 4

:nmai= (obsolete)

New nature of address indicator. This parameter specifies the nature of address indicator that will replace the received nature of address indicator.

Range: 0-127

Default: If the **rmgtt=no** parameter is specified, there is no change to the current value. If the **rmgtt=yes** parameter is specified, the value resets to a default of 0.

:nnp= (obsolete)

New numbering plan. This parameter identifies the numbering plan that will replace the received numbering plan.

Range: 0-15

Default: If the **rmgtt=no** parameter is specified, there is no change to the current value. If the **rmgtt=yes** parameter is specified, the value resets to a default of 0xFFFF.

:npdd= (obsolete)

New prefix digits to be deleted. This parameter identifies the new prefix digits to be deleted that will replace the received prefix digits to be deleted.

Range: 0-21

Default: If the **rmgtt=no** parameter is specified, no change to the current value. If the **rmgtt=yes** parameter is specified, the value resets to a default of 0xFFFF.

:npds= (obsolete)

New prefix digits string. This parameter specifies the new prefix digits string that will replace the received prefix digits string.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

Default: If the **rmgtt=no** parameter is specified, there is no change to the current value.
If the **rmgtt=yes** parameter is specified, the value resets to a default of no digits.

:nsdd= (obsolete)

New suffix digits to be deleted. This parameter identifies the new suffix digits to be deleted that will replace the received suffix digits to be deleted.

Range: 0-21

Default: 0

:nsds= (obsolete)

New suffix digits string. This parameter specifies the new new suffix digits string that will replace the received suffix digits string

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: No digits

:rmgtt= (obsolete)

This parameter resets all GT modification fields to default values before applying values for other parameters in the command.

Range: yes, no

Default: no

Example

chg-

```
gtt: type=5:gta=9195551212:egta=9195551999:xlat=dpcssn:ri=ssn:pc=255-002-001:ssn=255
```

chg-

```
gtt: ttn=lidb2:gta=9197771212:egta=9197771999:xlat=dpcngt:ri=gt:pc=255-002-001
```

```
chg-gtt: ttn=lidb6:gta=910777:pc=255-002-002
```

```
chg-gtt: type=10:gta=8005553232:egta=8005554000:gtmodid=sn1
```

```
chg-gtt: type=11:gta=8005553232:egta=8005554000:gtmodid=none
```

```
chg-gtt: gta=123456:pci=s-1-129-7:typei=41
```

```
chg-gtt: gta=223456:pcn=s-128-aa:typen=3
```

chg-

```
gtt: ttn=setmrn:gta=1234567890:egta=2234567890:pc=1-1-2:mrnset=none
```

chg-

```
gtt: ttn=setmrn:gta=2234567891:egta=2234567892:pc=1-1-2:mrnset=df1t
```

chg-

```
gtt: ttn=setmrn:gta=2345678901:egta=3456789012:pc=1-1-3:mrnset=2
```

chg-

```
gtt: ttn=setmap:gta=2345678911:egta=3456789022:ri=ssn:pc=2-2-2:ssn=6:mapset=df1t
```

The database contains a GTA range [5556000-5558000], but no part of the GTA range [5558001-5559000] exists. The following command deletes the GTA range [5556000-5558000] from the database and adds a new GTA range [5556800-5559000] to the database.

```
chg-gtt: ttn=tst1: gta=5556800: egta=5559000: split=no
```

The following command deletes the GTA range [5556800-5559000] from the database and adds three new GTA ranges [5556800-5556899], [5556900-5557000] and [5557001-5559000] to the database.

```
chg-gtt: ttn=tst1: gta=5556900: egta=5557000
```

The following example specifies hexadecimal digits for the gta, egta, and nsds parameters.

```
chg-
```

```
gtt: type=1: xlat=dpcssn: ri=ssn: ssn=10: pc=1-1-1: gta=df3456789012345678906: egta=df345678901234567890a
```

```
chg-
```

```
gtt: ttn=setmap: gta=2345678901: egta=3456789012: ri=ssn: pc=1-1-3: ssn=10: mapset=2: loopset=none: gtmoid=set6
```

The following example specifies that calling party GT modification is required.

```
chg-gtt: gta=981234: type=4: cggtmod=yes
```

```
chg-
```

```
gtt: typeis=5: gta=123456: egta=129999: xlat=dpc: ri=gt: pci=s-1-1-4
```

```
chg-gtt: typens=5: gta=123456: egta=129999: xlat=dpc: ri=gt: pcn=s-111
```

Dependencies

If the **pcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfnti** parameter.

The value specified for the **tt** parameter must correspond to the value specified for the **type/typea/typei/typen24/typeis/typens** parameter.

The value of the **tt** parameter must exist in the Translation Type table.

The ANSI/ITU SCCP Conversion feature must be enabled before a translated point code and a translation type in different network types can be specified.

If the **xlat=dpc**, **ri=ssn**, and **pc/pca/pci/pcn** parameters are specified, then the point code must exist in the MAP table.

If the new or existing **xlat** parameter value is **dpc**, the new or existing **ri** parameter value is **ssn**, and the **pc/pca/pci/pcn** parameter is not specified, a point code must exist in the Remote Point Code/ MAP table.

If the **xlat** parameter value is changed from **dpcssn** to **dpc** or **dpnngt**, a new **ssn** parameter value cannot be specified, and the current **ssn** parameter value must be removed.

If the new **xlat** parameter value is **dpcssn**, and the current **ssn** parameter value has been removed, a new **ssn** parameter value must be specified.

The start **gta** length must equal the number of digits specified by the translation type. If the VGTT (variable length GTT) feature is turned on, then up to 10 GTA lengths per translation type are allowed. When the **ent-gtt** command is entered to create entries, the software keeps track of the lengths and allows only ten different lengths. The global title address specified for the translation type must then have the same number of digits as an existing GTA.

If the specified or previously provisioned translated point code is of type ANSI, then the **ngti** value of the referred GT Modification Identifier (see the **ent-gtmod** command) must be **2**.

If the **egta** parameter is specified, the length must equal the length of the start **gta**.

If the **egta** parameter is specified, the value must be greater than the value specified for the **gta** parameter.

The range of global title addresses to be changed, as specified by the start and end global title addresses, must match exactly or be contained within an existing range in the global title translation data for the specified translation type.

The new **gta-egta** range cannot include the **gta** or the **egta** of an existing range. However, the new global title address range can completely fall within an existing global title address range. If the range overlaps, an error is generated that displays a list of overlapped global title addresses. An example follows that shows what happens when the user attempts to enter a global title address range (such as 8005550000 to 8005559999) that overlaps an existing range. The overlapping links must match. If they do not, the error message displays the list of overlapped global title addresses:

The following GTA ranges overlap the input GTA range

```
START GTA END GTA
8005550000 8005551999
8005552000 8005553999
8005554000 8005555999
CHG-GTT: MASP A - Command Aborted
```

The **tt** parameter cannot be specified with a value that has been defined as an alias for another translation type.

Either the **type** parameter or the **ttn** parameter must be specified.

Point code entries must be full point codes. Partial point codes are not allowed.

Table 5-7 shows the valid combinations for the **xlat**, **ri** and **ssn** parameters. All other combinations are rejected.

Table 5-7. Valid Parameter Combinations for **chg-gtt** Routing Parameters

New or Existing XLAT Value	New or Existing RI Value	Routing Action	SSN Value
DPC	GT	Translate DPC only and route on GT	Cannot be specified. The current database entry is removed.
DPC	SSN	Translate DPC only and route on SSN	Cannot be specified. The current database entry is removed.
DPCSSN	GT	Translate DPC and SSN and route on GT	Must be specified.
DPCSSN	SSN	Translate DPC and SSN and route on SSN	Must be specified.
DPCNGT	GT	Translate DPC only and route on GT	Cannot be specified. The current database entry is removed.

If the **ri=ssn** parameter is specified, the **mrnset** parameter cannot be specified.

If the Flexible GTT Load Sharing feature is enabled, the point code must already exist in the specified MRN set.

The specified MRN set must already exist in the MRN table.

The Flexible GTT Load-Sharing feature must be enabled before the **mrnset** parameter can be specified.

The SEAS command is not allowed to operate on any other MRN set except the default MRN set.

The **mapset** parameter can only be specified if the Flexible GTT Load Sharing feature is enabled, and the **ri=ssn** parameter is specified. If the **ri=ssn** parameter is specified, the **mapset** parameter must be specified. If the **ri=gt** parameter is specified, the **mapset** parameter cannot be specified.

If the Flexible GTT Load Sharing feature is not enabled, the **mapset** parameter cannot be specified.

At least one entry must be provisioned in the specified MAP set in the MAP table.

The specified or previously provisioned point code and subsystem number must exist in the specified or previously provisioned MAP set.

The SEAS command cannot operate on any MAP set other than the default MAP set.

The specified GTA must lie within an existing GTA range in the specified GTT Set.

The specified GTA range must not overlap with any other existing GTA range in the specified GTT Set.

If the Flexible GTT Load Sharing feature is enabled, then the specified PC must exist in the MRN set.

If the **ri=gt** parameter is specified, the **mapset** parameter cannot be specified.

The Hex Digit Support for GTT feature must be turned on before hexadecimal digits can be specified for the **gta** or **egta** parameter.

The SCCP Loop Detection feature must be enabled before the **loopset** parameter can be specified.

The value of the **loopset** parameter must already exist in the database.

The SCCP Loop Detection feature must be enabled before the **loopset** parameter can be specified.

The value of the **loopset** parameter must exist in the Loopset table.

If the **ri=gt** parameter is specified, the **mrnset** parameter must be specified.

The new or existing **pc** or **ssn** combination must exist as a mated application.

The GTT table cannot be full.

If the value of the **pc/pca/pci/pcn/pcn24** parameter is the True Point Code, then the **xlat=dpcssn** parameter and the **ri=ssn** parameter must be specified.

If the **ssn** parameter is specified, and if the value of the **pc/pca/pci/pcn/pcn24** parameter is the True Point Code, then the value of the **ssn** parameter must exist in the SS-APPL table.

The value of the **pc/pca/pci/pcn/pcn24** parameter must exist as a destination in the ordered route entity set or must reside in a cluster (ANSI only) that exists as a destination in the ordered route entity set.

If the **xlat=dpcssn** and **ri=gt** parameters are specified, then the **ssn** parameter must be specified.

The **xlat=dpcssn** parameter must be specified before the **ssn** parameter can be specified.

If the **xlat=dpngt** parameter is specified, then the **ri=gt** parameter must be specified.

The **gta** length is not defined for the specified translation type entity.

If the **tt** parameter is not specified, then the value of the **ttn** parameter must match the value of a **tt** parameter in the STP database.

The value of the **pc/pca/pci/pcn/pcn24** parameter cannot be out of range.

At least one optional parameter must be specified.

The value specified for the **pc** parameter cannot be associated with a proxy point code.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the **eggtmod** parameter can be specified.

The GTT set associated with the translation type specified by the **ttn** parameter must have a set type of **cdgta** (see the **ent-gttset** command).

The value specified by the **gmodid** parameter must already exist in the GTMOD table (see the **ent-gtmod** command).

The **ttn=none** parameter cannot be specified.

The network domain of the translation type specified by the **ttn** parameter cannot be CROSS (see the **ent-gttset** command).

The **xlat=none** parameter cannot be specified.

The values specified for the **gta** and **egta** parameters must match the GTA values referred in the GTT Action Path table (see the **ent-gttapath** command).

Notes

The specified DPC, SSN, relative cost, and routing indicator will overwrite the existing data values in the table.

As of Release 42.0, all point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**).

When the Intermediate GTT Load Sharing feature and the Flexible GTT Load Sharing feature are on, multiple relationships can be defined among a set of destination point codes in the existing MRN table. The relationship used in a particular translation is based on the GTA digits used for translation. The MRN Set and the post-translation PC formulate a key used as a lookup in the MRN table. The MRN table lookup results in a set of alternate PCs, one of which is selected (based on relative cost) to route the MSU in the most cost effective way.

When the Flexible GTT Load Sharing feature is turned on, multiple relationships among a set of PCs and SSNs in the existing MAP table are supported. The relationship used in a particular translation is based on the GTA digits used for translation. The MAP set ID and PC/SSN formulate a key that is used to perform lookup tasks in the MAP table. The lookup results in a set of mate PC/SSNs, one of which is selected to route the MSU in the most cost effective way.

If the AMGTT feature is turned off, then the Default GT Conversion table is used for conversion. A loopset consists of a set of point codes that form a routing loop in the network. If the SCCP Loop Detection feature is enabled, then the loopset can be associated with or disassociated from specified translation entries. Loopsets that are associated with translation entries are checked during intermediate and final GTT traffic routing. If a loop exists, then the system can be notified with or without discarding the associated traffic.

The maximum length of the resulting GTA string must not exceed 21 digits when translation is complete.

If the range specified by the **gta** and **egta** parameters does not exactly match the existing range, then the existing range is split. All addresses in the existing range that are outside the range specified by the **gta** and **egta** parameters retain the original **xlat**, **ri**, **pc** and **ssn** parameters.

A new range is created that is bounded by the **gta** and **egta** parameters. The new range contains new values for the **xlat**, **ri**, **pc** and **ssn** parameters that are present in the command, while retaining parameter values from the previous range that do not have corresponding new values in the command.

If the EGTT feature is turned on, then the following occurs for the **chg-gtt** command:

- For ANSI, if a GTT selector is deleted using the **dlt-gttsel** command, then the corresponding GTT entry cannot be updated.
- For ITU, if a true GTT selector entry (GTI=2 or GTI=4) is deleted using the **dlt-gttsel** command, or if the GTT set name of an entry is changed using the **chg-gttset** command, then the corresponding GTT entry cannot be updated.

Output

```
chg-gtt:gta=981234:type=4:cggmod=yes:gtmodid=set3
tekelecstp 10-03-09 17:29:06 EST EAGLE 42.0.0
CHG-GTT: MASP A - COMPLTD
;
```

chg-gttact

Change a GTT Action entry

Use this command to change a Global Title Translation (GTT) Action entry. A GTT Action entry consists of an Action ID, an action, and action specific data. The action specified in the entry determines the process that is performed on the MSU during translation.

Keyword: **chg-gttact**

Related Commands: **dlt-gttact, ent-gttact, rtrv-gttact**

Command Class: Database Administration

Parameters

NOTE: Definitions for the feature options specified by the on and off parameters are located in the Notes section.

:actid= (mandatory)

GTT Action ID. This parameter specifies the Action ID that is associated with the GTT Action entry.

Range: *ayyyyyyy*

1 leading alphabetic character and up to 8 following alphanumeric characters

:act= (optional)

Action. This parameter specifies the GTT Action that is applied to the message.

Range: **disc, dup, tcaperr, udts, fwd**

disc— discard message with no return error

dup— route a copy of the message to a specified duplicate node

tcaperr— discard message that has a specified TCAP error

udts— discard message and send UDTS/XUDTS

fwd— route the original message to a specified forward node instead of the destination indicated by the GTT/DB data

:atcaperr= (optional)

ANSI TCAP error cause. This parameter specifies the reason for discarding a message that contains the ANSI TCAP portion associated with the **tcaperr** GTT Action.

Range: **0-255**

Default: No change to the current value

:cdgtmodid= (optional)

Called party global title modification identifier.

Range: *ayyyyyyy*, **none**

1 alphabetic followed by up to 8 alphanumeric characters

none—removes the association between the GTT Action entry and the CdPGT modification identifier

Default: No change to the current value

:cggtmodid= (optional)

Calling party global title modification identifier.

Range: *ayyyyyyy*, **none**

1 alphabetic character followed by up to 8 alphanumeric characters

none—removes the association between the GTT Action entry and the CgPGT modification identifier

Default: No change to the current value

:cgpc= (optional)

ANSI CgPA point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **cgpc**

Range: **p-**, **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:cgpci= (optional)

ITU international CgPA point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:cgpcn= (optional)

ITU national CgPA point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:cgpcn24= (optional)

24-bit ITU national CgPA point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:cgpcogmsg= (optional)

This parameter specifies the data that is used as the Calling Party Point Code in the outgoing message.

Range: **dflt, cgpcicmsg, opciemsg, provegpc**

dflt—Default. The standard Global Title Translation process supplies the CgPA PC.

cgpcicmsg—CgPA PC data from the incoming MSU

opciemsg—OPC data from the incoming MSU

provegpc—provisioned CGPC/CGPCA/CGPCI/CGPCN/CGPCN24 data in the GTT Action

Default: No change to the current value

:defactid= (optional)

Default Action ID. This parameter specifies the default action that is performed when the **fwd** GTT Action fails to route the MSU.

Range: *ayyyyyyy*

1 leading alphabetic character followed by 8 alphanumeric characters

The **defactid** parameter can take one of the following values:

- GTT Action ID with a GTT Action of **disc**, **udts**, or **tcaperr** (see the **act** parameter). This value must already be defined in the GTT Action table.
- **fallback**—The MSU is routed using routing data in the translated MSU.

:itcaperr= (optional)

ITU TCAP error cause. This parameter specifies the reason for discarding the message that contains the ITU TCAP portion associated with the **tcaperr** GTT Action.

Range: **0-255**

Default: No change to the current value

:loopset= (optional)

SCCP loopset name. This parameter associates a GTT Action with a loopset.

Range: *ayyyyyyy*, **none**

One leading alphabetic character and up to 7 following alphanumeric characters.

none—disassociates the GTT Action from all loopsets

Default: No change to the current value

:mapset= (optional)

MAP Set ID. This parameter specifies the Mated Application Set ID.

Range: **1-36000 dflt**

dflt—Default MAP set

Default: No change to the current value

:mrnset= (optional)

MRN Set ID. This parameter specifies the Mated Relay Node Set ID.

Range: 1-3000 none, dflt

dflt—Default MRN Set ID

none—The GTT Action does not participate in any loadsharing.

Default: No change to the current value

:nactid= (optional)

New GTT Action ID.

Range: ayyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters

:off= (optional)

Disables or turns off the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned off. Up to 8 feature options can be specified in the list.

Range: uimreqd, useicmsg

:on= (optional)

Enables or turns on the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned on. Up to 8 feature options can be specified in the list.

Range: uimreqd, useicmsg

:pc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: pca

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.

The point code **000-000-000** is not a valid point code.

:pci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)* The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:ri= (optional)

Routing indicator. This parameter specifies the routing indicator in the SCCP called party address of the MSU being processed.

Range: **gt, ssn**

gt— route by the global title digits

ssn— route by the subsystem number

:ssn= (optional)

Subsystem number. This parameter specifies the value used for the SSN in the SCCP called party address of the MSU.

Range: **2-255 none**

none—an SSN is not used

:udtserr= (optional)

UDTS error cause. This parameter specifies the reason associated with the **udts** GTT Action for discarding the message.

Range: **0-255**

Default: No change to the current value

Example

```
chg-gttact:actid=dup1:act=dup:ssn=40
```

Changing the Action Id of the already provisioned GTT Action entry.

```
chg-gttact:actid=dup1:act=dup:nactid=dup2
```

```
chg-gttact:actid=disc1:act=tcaperr:atcaperr=10
```

```

```

Dependencies

A value of **dup** or **fwd** must be specified for the **act** parameter before the **pc/pca/pci/pcn/pcn24**, **cgpc/cgpca/cgpci/cgpcn/cgpcn24**, **cgpcogmsg**, **cdgtmodid**, **cggtmodid**, **ssn**, **ri**, **mrnset**, **mapset**, or **loopset** parameters can be specified and before a value of **useicmsg** can be specified for the **on** or **off** parameter. The **act=tcaperr** parameter must be specified before the **atcaperr** and **itcaperr** parameters can be specified. The **act=udts** parameter must be specified before the **udtserr** parameter can be specified. The **act=fwd** parameter must be specified before the **defactid** parameter can be specified.

A value of **disc**, **udts**, or **tcaperr** must be specified for the **act** parameter before a value of **uimreqd** can be specified for the **on** or **off** parameter can be specified.

The GTT Action entry specified by the **actid** parameter must already exist in the database.

The value specified for the **nactid** parameter cannot already exist in the database.

A value of **none** or **fallback** cannot be specified for the **actid** or **nactid** parameter.

If a value of **dup** or **fwd** is specified for the **act** parameter then the **pc/pca/pci/pcn/pcn24** parameter must be specified. If the **cgpcogmsg=provcgpc** parameter is specified, then the **cgpc/cgpca/cgpci/cgpcn/cgpcn24** must be specified.

The GTT Action - DISCARD feature must be enabled before a value of **disc**, **udts**, or **tcaperr** can be specified for the **act** parameter.

The GTT Action - DUPLICATE feature must be enabled before the **act=dup** parameter can be specified.

The specified PC/SSN must already exist in the specified MAP set.

If the **ri=ssn** parameter is specified, then the **mrnset** parameter cannot be specified.

The Flexible GTT Load Sharing feature must be enabled before the **mrnset** parameter can be specified.

If the **ri=gt** parameter is specified, then the **mapset** parameter cannot be specified.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified

The specified MAP set must already exist in the database.

The specified MRN set must already exist in the MRN table.

If the Flexible GTT Load Sharing feature is enabled, then the specified PC must already exist in the specified MRN set.

The point code specified for the **pc/pca/pci/pcn/pcn24** parameter must be a full point code.

The value specified for the **pc/pca/pci/pcn/pcn24** parameter must already exist as a destination in the Route table.

If the value specified for the **pc/pca/pci/pcn/pcn24** parameter is the STP true point code, then the value specified for the **ssn** parameter must already exist in the SS-APPL table.

The value specified for the **pc** parameter cannot be associated with a proxy point code.

If the **pc/pca/pci/pcn/pcn24**, **ri=ssn** and **ssn** parameters are specified, then the PC/SSN must be populated in the Remote Point Code and MAP tables.

The point code specified for the **pc/pca/pci/pcn/pcn24** and **cgpc /cgpca/cgpci/cgpcn/cgpcn24** parameters must be within the range specified by the parameter definition.

A value of **disc**, **udts**, or **tcaperr** must be specified for the **defactid** parameter.

If the **ri=ssn** and the **ssn=none** parameters cannot be specified together in the command.

The SCCP Loop Detection feature must be enabled before the **loopset** parameter can be specified.

The value specified for the **loopset** parameter must already exist in the database.

The GTT Action - FORWARD feature must be enabled before the **act=fwd** parameter can be specified.

The point code specified by the **pc/pca/pci/pcn/pcn24** parameter must be associated with a valid route.

If the value specified for the **pc/pca/pci/pcn/pcn24** parameter is the STP true point code, then the **ri=ssn** parameter must be specified.

The values specified for the **cdgtmodid** and **cggtmodid** parameters must already exist in the GTMOD table.

The AMGTT or AMGTT CgPA Upgrade feature must be turned on before the **cggtmodid** parameter can be specified.

The GTT Action ID specified by the **defactid** parameter must already exist.

The **pc/pca/pci/pcn/pcn24** and **cgpc/cgpca/cgpci/cgpcn/cgpcn24** parameters must have the same domain.

One of the optional parameters must be specified.

The value specified by the **act** parameter cannot be changed until the associated Action ID is referenced by an Action Set or by any forward action. The value can only be changed from **disc/udts/tcaperr** to **disc/udts/tcaperr**.

The **defactid=none** parameter cannot be specified.

The same value(s) cannot be specified for the **on** and **off** parameters.

Notes

on/off options

- **uimreqd**—UIM required. Specifies whether a UIM should be generated.
- **useicmsg**—Use Incoming Message. Specifies whether to apply GTT Action data to the message as the message was received (OFF) or after any EPAP or GTT translation/modification data has been applied (ON).

Output

```

chg-gttact:actid=dup1:ssn=40

GTT Action table is (2 of 2000) 1% full

CHG-GTTACT: MASP A - COMPLTD
;

```

chg-gttapath**Change a GTT Action Path Entry**

Use this command to change a GTT Action path entry. A GTT Action path consists of pairs of "setname + value" for Opcode/CgGTA/CdGTA. Each "setname + value" pair must already be defined in the GTT translation table.

Keyword: **chg-gttapath**

Related Commands: **dlt-gttapath, ent-gttapath, rtrv-gttapath**

Command Class: Database Administration

Parameters

:gttbn= (mandatory)

GTT Path name.

Range: *ayyyy*

1 leading alphabetic character and up to 4 following alphanumeric characters.

:acn= (optional)

Application context name. This parameter specifies the ITU TCAP *acn* field in the incoming MSU.

Range: **0-255 ***, **none**

none—there is no ITU TCAP *acn* field in the incoming MSU

:cdgta= (optional)

Called Party Global Title Address.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

:cdgttsn= (optional)

GTT set name (CDPA type).

Range: *ayyyyyyy*

1 leading alphabetic and up to 8 following alphanumeric characters.

:cgta= (optional)

Calling Party Global Title Address.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

:cggttsn= (optional)

GTT set name (CGPA type).

- Range:** *aaaaaaaa*
1 leading alphabetic and up to 8 following alphanumeric characters.
- :family=** (optional)
This parameter specifies the ANSI TCAP *family* field in the incoming MSU.
Range: **0-255 ***, **none**
none—there is no value in the ANSI TCAP *family* field in the incoming MSU
- :ngttn=** (optional)
GTT Path name. This parameter specifies the new GTT path name.
Range: *yyyyy*
1 leading alphabetic character and up to 4 following alphanumeric characters.
- :opcode=** (optional)
This parameter specifies the TCAP *opcode* field in the incoming MSU.
Range: **0-255 ***, **none**
none—there is no value in the TCAP *opcode* field in the incoming MSU
- :opgttsn=** (optional)
GTT set name (Opcode type).
Range: *aaaaaaaa*
1 leading alphabetic and up to 8 following alphanumeric characters.
- :pkgtype=** (optional)
This parameter specifies the ANSI and ITU TCAP package type.
Range: **ituuni, qwp, qwop, resp, cwp, cwop, any, bgn, end, cnt, ituabort, ansiabort, ansiuni**
ituuni — ITU unidirectional
qwp — Query with Permission
qwop — Query without Permission
resp — Response
cwp — Conversation with Permission
cwop — Conversation without Permission
any — Wildcard value
bgn — Begin
end — End
cnt — Continue
ituabort — ITU abort
ansiabort — ANSI abort
ansiuni — ANSI unidirectional
ANSI TCAP Package Types—**ansiuni, qwp, qwop, resp, cwp, cwop, ansiabort, any**
ITU TCAP Package Types—**bgn, ituabort, ituuni, any, end, cnt**

Example

```
chg-
gttapath:gtttn=path1:opgttsn=opsn2:acn=1-1-1-1-1-1-1:opcode=123:pkgtype=ituuni
chg-gttapath:gtttn=path1:cggtsn=cgsn2:cggta=45673
chg-gttapath:gtttn=path1:ngttn=path2
```

Dependencies

If the **family** parameter is specified, then a value of **ansiuni, qwp, qwop, resp, cwp, cwop, ansiabort**, or **any** must be specified for the **pkgtype** parameter.

If the **acn** parameter is specified, then a value of **bgn**, **ituabort**, **ituuni**, **any**, **end**, or **cnt** must be specified for the **pkgtype** parameter.

If the **pkgtype=ituabort** parameter is specified, then a value of **none** must be specified for the **acn** and **opcode** parameters. If the **pkgtype=ansiabort** parameter is specified then a value of **none** must be specified for the **family** and **opcode** parameters.

The **opcode**, **pkgtype**, and **family** parameters must be specified together for ANSI TCAP translations. The **opcode**, **pkgtype**, and **acn** parameters must be specified together for ITU TCAP translations.

If the **family** and **opcode** parameters are specified, then either both parameters must have a value of **none** or neither parameter can have a value of **none**.

A value of **none** cannot be specified for the **opgttsn**, **cggtsn**, and **cdgttsn** parameter(s).

The specified path cannot already exist in the GTT Action Path table.

The **acn** and **family** parameters cannot be specified together in the command.

The GTT Action - DISCARD, GTT Action - FORWARD, or GTT Action - DUPLICATE feature must be enabled before this command can be entered.

A translation entry corresponding to the specified (**opgttsn + opcode + pkgtype + acn/family**)/(**cgttsn + cggta**)/(**cdgttsn + cdgta**) parameters must exist.

At least one GTT set-value combination must be specified.

The GTT set name specified by the **opgttsn**, **cggtsn**, or **cdgttsn** parameter must match an existing GTT set name.

The GTT set name specified by the **opgttsn**, **cggtsn**, and **cdgttsn** parameters must have set types of **opcode**, **cggta**, and **cdgta**, respectively.

The GTA value specified by the **cggta** or **cdgta** parameter must be the start GTA in the translation entry.

The GTT path name specified by the **gttpn** parameter must already exist in the database.

A GTT set-value combination(s) cannot be associated with a GTT path that is already associated to another combination. The value specified for the path name must be different from the existing path name.

The GTT path name specified by the **ngttn** parameter cannot already exist in the database.

The value specified for the **gttpn** and **ngttn** parameters cannot be a reserved word.

At least one optional parameter must be specified.

Output

```
chg-gttapath:gttpn=path2:cggtsn=cgsn2:cggta=45673
tekelecstp 10-02-04 18:29:41 EST EAGLE 42.0.0
chg-gttapath:gttpn=path2:cggtsn=cgsn2:cggta=45673
Command entered at terminal #4.

GTT Action Path table is (1 of 10000) 1% full

CHG-GTTAPATH: MASP A - COMPLTD
;
```

chg-gttaset

Change a GTT Action Set entry

Use this command to change Global Title Translation (GTT) Action Set data. A GTT Action Set consists of an Action Set name and a set of Action IDs. The specified Action IDs determine the actions that are applied to the MSU during translation.

NOTE: Action IDs are configured using the ent/chg/dlt-gttact commands.

Keyword: chg-gttaset

Related Commands: dlt-gttaset, ent-gttaset, rtrv-gttaset

Command Class: Database Administration

Parameters

NOTE: Definitions for the feature options specified by the on and off parameters are located in the Notes section.

:actsn= (mandatory)

GTT Action Set Name.

Range: *ayyyyyyy*

1 leading alphabetic character and up to 8 following alphanumeric characters

:actid1= (optional)

GTT Action ID 1. This parameter specifies the first Action ID associated with the GTT Action Set.

Range: *ayyyyyyy*, **none**

1 leading alphabetic character and up to 8 following alphanumeric characters

none—removes the Action ID from the GTT Action Set

:actid2= (optional)

GTT Action ID 2. This parameter specifies the second Action ID associated with the GTT Action Set.

Range: *ayyyyyyy*, **none**

1 leading alphabetic character and up to 8 following alphanumeric characters

none—removes the Action ID from the GTT Action Set

:actid3= (optional)

GTT Action ID 3. This parameter specifies the third Action ID associated with the GTT Action Set.

Range: *ayyyyyyy*, **none**

1 leading alphabetic character and up to 8 following alphanumeric characters

none—removes the Action ID from the GTT Action Set

:actid4= (optional)

GTT Action ID 4. This parameter specifies the fourth Action ID associated with the GTT Action set.

Range: *ayyyyyyy*, **none**

1 leading alphabetic character and up to 8 following alphanumeric characters

none—removes the Action ID from the GTT Action Set

:actid5= (optional)

GTT Action ID 5. This parameter specifies the fifth action ID associated with the GTT Action set.

Range: *ayyyyyyy*, **none**

1 leading alphabetic character and up to 8 following alphanumeric characters

none—removes the Action ID from the GTT Action Set

:actid6= (optional)

GTT Action ID 6. This parameter specifies the sixth Action ID associated with the GTT Action Set.

Range: *ayyyyyyy*, **none**

1 leading alphabetic character and up to 8 following alphanumeric characters

none—removes the Action ID from the GTT Action Set

:nactsn= (optional)

New GTT Action Set Name.

Range: *ayyyyyyy*
1 leading alphabetic character and up to 8 following alphanumeric characters

:off= (optional)

Disables or turns off the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned off. Up to 8 feature options can be specified in the list.

Range: **testmode**

:on= (optional)

Enables or turns on the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned on. Up to 8 feature options can be specified in the list.

Range: **testmode**

Example

Changing the GTT Action Set name:

```
chg-gttaset:actsn=asetdisc1:nactsn=asetdisc2
```

Removing Action ID1 and ID3 from an Action Set and changing ID2 to another ID in the GTT Action Set table:

```
chg-gttaset:actsn=asetdup1:actid1=none:actid2=disc1:actid3=none:off=testmode
```

```
chg-gttaset:actsn=asetfwd1:actid1=actfwd1:actid2=actdup1:on=testmode
```

Dependencies

The Action ID specified by the **actid(X)** parameter(s) must already exist in the GTT Action table.

The value specified for the **nactsn** parameter cannot already exist in the database.

The GTT Action Set name specified by the **actsn** parameter must already exist in the GTT Action Set table.

A value of **none** cannot be specified for the **actsn** or **nactsn** parameter.

At least one Action ID in the Action Set must be associated with an action other than **none** or **fallback**.

Only one Action ID in an Action Set can be associated with an action of type **disc**, **udts**, or **tcaperr**. If an Action ID with an action of **fwd** is specified, then no other Action ID in the Action Set can be associated with an act of **disc**, **udts**, **tcaperr**, or **fwd**. If the Action Set contains 5 Action IDs with an action of **dup** then the remaining Action ID cannot have an action of **dup**. Action IDs associated with an action of **disc**, **udts**, **tcaperr**, or **fwd** must be the last actions in an Action Set.

One of the optional parameters must be specified.

The **actid1/actid2/actid3/actid4/actid4/actid5/actid6** parameters must each specify a unique Action ID in the command.

The EGTT feature must be turned on before this command can be entered.

The same option(s) cannot be specified for the **on** and **off** parameters.

Notes

on/off options

- **testmode**—invokes a field-safe Test Tool used to debug the GTT Action Set rules

Output

```

chg-gttaset:actsn=asetdup1:actid1=dup2:on=testmode
tekelecstp 10-02-04 18:29:41 EST EAGLE 42.0.0
chg-gttaset:actsn=asetdup1:actid1=dup2:on=testmode
Command entered at terminal #4.

GTT Action Set table is (2 of 20000) 1% full

CHG-GTTASET: MASP A - COMPLTD
;

```

chg-gttset

Change GTT Selectors

Use this command to change the global title translation (GTT) set linked with an existing **gti(x)**, **tt**, **np/npv**, **nai/naiv**, **lsn**, **selid**, **eaglepn**, and **cgssn** combination.

NOTE: If the EGTT feature is turned on, then the GTT Selector (ent/chg/dlt/rtrv-gttset), GTT Set (ent/dlt/rtrv-gttset), and GTA (ent/chg/dlt/rtrv-gta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is on.

Keyword: chg-gttset

Related Commands: dlt-gttset, ent-gttset, rtrv-gttset

Command Class: Database Administration

Parameters

NOTE: The nature of address indicator parameters (naiv or nai) and the numbering plan parameters (npv or np) can be specified using either a mnemonic or an explicit value. Both values cannot be specified at the same time for the same parameter. Table A-7 shows the mapping between the naiv and nai values. Table A-8 shows the mapping between the npv and np values.

:gti/gtia/gtii/gtin/gtin24/gtiis/gtins= (mandatory)

Global title indicator.

For all EGTT selector commands, the domain is defined as **gti** and **gtia** (ANSI), **gtii** (ITU international), **gtin** (ITU national), **gtin24** (24-bit ITU national), **gtiis** (ITU international spare), and **gtins** (ITU national spare).

For the selector commands, **gti** and **gtia** are equivalent. GTT selectors can be provisioned for the same translation type (TT) with different ITU domains.

Range: 0, 2, 4

Supported value for ANSI: **gti=0, 2** and **gtia=0, 2**

Supported values for ITU: **gtii/gtin/gtin24/gtiis/gtins=0, 2, 4**

:cdgtasn= (optional)

CdPA GTA GTT set name.

Range: ayyyyyyy, none

1 leading alphabetic character and up to 8 following alphanumeric characters.

none—Set names do not point to the CdGTA set.

:cdgttsn= (optional)

CdPA GTT set name.

Range: *aaaaaaaa*, **none**

1 leading alphabetic and up to 8 following alphanumeric characters.

none—Set names do not point to the CdPA GTT set.

:cgtasn= (optional)

CgPA GTA GTT set name.

Range: *aaaaaaaa*, **none**

1 leading alphabetic character and up to 8 following alphanumeric characters.

none—Set names do not point to the CgGTA set.

:cgttsn= (optional)

CgPA GTT set name.

Range: *aaaaaaaa*, **none**

1 leading alphabetic and up to 8 following alphanumeric characters.

none—Set names do not point to the CgPA GTT set.

:cgpcsn= (optional)

CgPA PC GTT set name.

Range: *aaaaaaaa*, **none**

1 leading alphabetic character and up to 8 following alphanumeric characters.

none—Set names do not point to the CgPC set.

:cgssn= (optional)

CgPA subsystem number.

Range: **0-255**

:eaglegen= (optional)

This parameter specifies whether the selector is used by EAGLE 5 ISS generated messages.

Range: **yes**

yes — used by an EAGLE 5 ISS MSU

:gttsn= (optional)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

Range: *aaaaaaaa*

1 leading alphabetic character and up to 8 following alphanumeric characters.

:lsn= (optional)

Linkset name. This parameter specifies the linkset that is used in GTT routing.

Range: *aaaaaaaaa*

1 alphabetic character followed by up to 9 alphanumeric characters

:nai= (optional)

Nature of Address indicator.

Range: **sub, rsvd, natl, intl, dflt**

:naiv= (optional)

Nature of Address indicator value.

Range: **0-127**

:np= (optional)

Numbering Plan.

Range: **e164, generic, x121, f69, e210, e212, e214, private, dflt**

:npv= (optional)
 Numbering Plan value.
Range: 0-15

:selid= (optional)
 Selector ID.
Range: 0-65534

:tt= (optional)
 Translation type.
Range: 0-255

Example

```
chg-
gttset:gtii=2:tt=40:cdgtasn=setcggtta:cgpcsn=none:cgssn=10:selid=1
2
```

```
chg-gttset:gtia=2:tt=253:gttsn=newansi
```

```
chg-gttset:gtin=4:tt=0:np=df1t:nai=df1t:gttsn=setint000
```

The following example would change the selectors (gtii=4, tt=5, npv=1, naiv=2) linked with GTTSN ansi1 so that the selectors are linked with ansi2 (assuming that ansi2 is an existing GTT set in the database):

```
chg-gttset:gtii=4:tt=5:npv=1:naiv=2:gttsn=ansi2
```

```
chg-
```

```
gttset:gtin=4:tt=60:npv=5:naiv=5:cgpcsn=setcgpc:selid=100:cgssn=1
0
```

```
chg-
```

```
gttset:gtia=2:tt=21:cdgttsn=setcgpc:cdgttsn=setcdgta:cgssn=20:sel
id=1:lsn=ls10
```

```
chg-gttset:gtia=2:tt=2:cdgttsn=setcdgta:lsn=ls1010
```

```
chg-gttset:gtia=2:tt=2:cdgttsn=setcdgta:eaglegen=yes
```

```
chg-gttset:gtins=4:cdgttsn=setitu004:tt=4:np=e164:nai=intl
```

```
chg-gttset:gti=0:cdgttsn=setansi0
```

Dependencies

The EGTT feature must be turned on before this command can be entered.

The **np** and **npv** parameters cannot be specified together in the same command.

The **nai** and **naiv** parameters cannot be specified together in the same command.

The **gti/gtia=4**, **gti(x)=1**, and **gti(x)=3** parameters cannot be specified.

If the **gti/gtia/gtii/gtin/gtin24/gtiis/gtins=2** parameter is specified, then the **np/npv** and **nai/naiv** parameter combinations cannot be specified.

If the **gtii/gtin/gtin24/gtiis/gtins=4** parameter is specified, an **np(v)** and **nai(v)** parameter combination must be specified. These parameters can be specified in any combination: **np/naiv**, **npv/nai**, **np/nai**, or **npv/naiv**.

The network domain (ANSI or ITU) must match that of the GTT Set entry that is specified by the **cdgttsn**, **cdgtasn**, or **gttsn** parameter.

The GTT set specified by the **cdgtasn**, **cdgttsn**, or **gttsn** parameter must already exist in the GTT Set table.

A value of **none** cannot be specified for the **gttsn**, **cdgtasn**, **cdgttsn**, **cggttsn**, **cggtasn**, or **cgpcsn** parameter.

The OBSR feature must be enabled before the **cdgtasn**, **cggtasn**, **cgpcsn**, or **cgssn** parameter can be specified.

The GTT set specified by the **cggttsn**, **cggtasn**, or **cgpcsn** parameter must already exist in the GTT Set table.

The network domain of the CgPA GTT Set specified by the **cggttsn**, **cggtasn**, or **cgpcsn** parameter must match the domain indicated by the **gti(x)** parameter.

The set type specified by the **cggtasn** or **cgpcsn** parameter must match the set type of the corresponding entry in the GTT set table. For example, the **cggtasn** parameter should have a set type of **cggtta**, and the **cgpcsn** parameter should have a set type of **cgpc**.

A value of **none** cannot be specified for the **cdgtasn** parameter if the **gttsn** parameter specifies the only GTTSET associated with that selector.

If the FLOBR feature is turned on, then the **cdgtasn**, **cggtasn**, and **cgpcsn** parameters cannot be specified.

An entry must already exist that matches the **gti(x)**, **tt**, and **np(v)** and **nai(v)** combination of parameters.

If the OBSR feature is enabled or the FLOBR feature is turned on, then the **gttsn** parameter cannot be specified.

The **np** and **nai** parameters must both have a value of **dflt** or neither can have a value of **dflt**.

The domain indicated by the **gti(x)** parameter must match the domain of the linkset specified by the **lsn** parameter.

The FLOBR feature must be turned on before the **lsn**, **eaglegen**, **cdgttsn**, and **cggttsn** parameters can be specified.

At least one GTT set name parameter must be specified. These parameters include:

- **cdgtasn**, **cggtasn**, or **cgpcsn** if the OBSR feature is enabled
- **cdgttsn** or **cggttsn** if the FLOBR feature is turned on
- **gttsn** if the OBSR feature is not enabled and the FLOBR feature is not turned on

The GTT Set specified by the **cdgtasn** or **gttsn** parameter must have a set type of **cdgtta** (see the **ent-gttset** command).

The linkset specified by the **lsn** parameter must already exist in the Linkset table.

The SSNSELID Table cannot contain more than 100,000 entries.

The GTTDBMM Table cannot contain more than 42,502 entries.

If the **lsn** parameter is specified, then the **cdgttsn** or **cggttsn** parameter must be specified.

The **cggtasn**, **cgpcsn**, and **cggttsn** parameters cannot be specified together in the command.

The **gttsn**, **cdgtasn**, and **cdgttsn** parameters cannot be specified together in the command.

If the **gttsn**, **cdgttsn**, or **cdgtasn** parameter is specified, then the **cgssn** parameter cannot be specified.

If the **cggtasn**, **cgpcsn**, or **cggttsn** parameter is specified, then the **cgssn** parameter must be specified.

If the **eaglegen=yes** parameter is specified, then the **lsn**, **selid**, **gttsn**, **cdgtasn**, **cgssn**, **cggttsn**, **cggtasn**, and **cgpcsn** parameters cannot be specified.

If the **np=dflt** or **nai=dflt** parameter is specified, then the **cggtasn**, **cggttsn**, **cgpcsn**, **cgssn**, **eaglegen**, **lsn**, and **selid** parameters cannot be specified.

If the **gti(x)=0** parameter is specified, then the **eaglegen**, **tt**, **np/npv**, and **nai/naiv** parameters cannot be specified.

If a value of **2** or **4** is specified for the **gti(x)** parameter, then the **tt** parameter must be specified.

Notes

The entry that matches the specified parameter combination is assigned to the specified **gttsn**.

When the Origin-based SCCP Routing feature is enabled, two GTT sets, either the **cdgtasn/cggtasn** or the **cdgtasn/cgpcsn**, can be assigned to a GTT selector. The **cggtasn** and **cgpcsn** GTT sets are mutually exclusive and cannot be assigned to the same GTT selector.

When the value of the **cggtasn/cgpcsn** GTT set is specified as **none**, that combination (domain, **tt**, **gti**, **np/npv**, **na/ani**, **cgssn**, and **selid**) are deleted from the database. At any point of time, each provisioned selector must have at least one GTT set.

Output

```
chg-gttset:gti=0:cdgttsn=setansi0
tekelecstp 10-04-28 13:02:49 EST Eagle 42.0.0
chg-gttset:gti=0:cdgttsn=setansi0
Command entered at terminal #4.

```

chg-gttset

Change GTT Set

Use this command to specify the attributes to change for an existing set of global title translations.

Keyword: **chg-gttset**

Related Commands: **dlt-gttset**, **ent-gttset**, **rtrv-gttset**

Command Class: Database Administration

Parameters

:gttsn= (mandatory)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

Range: *ayyyyyyy*

1 alphabetic character followed by up to 8 alphanumeric characters.

:ndgt= (optional)

Number of digits. This parameter specifies the number of digits required for GTAs associated with this GTT set.

Range: **1-21**

:netdom= (optional)

Network domain. This command does not distinguish between ITU national or ITU international because the Enhanced Global Title Translation (EGTT) feature does not discriminate between the ITU-I and ITU-N translations.

NOTE: The netdom parameter refers to the incoming message network domain.

Range: **cross, ansi, itu**

:ngttsn= (optional)

New GTT set name. This parameter specifies the GTT set name that will replace the existing GTT set name.

Range: *ayyyyyyy*

1 alphabetic character followed by up to 8 alphanumeric characters.

Example

```
chg-gttset:gttsn=lidb:netdom=cross
chg-gttset:gttsn=setxyz:netdom=cross:ndgt=10
chg-gttset:gttsn=acdgt:ngttsn=acdgt1
```

Dependencies

The **(n)gttsn=none** parameter cannot be specified.

The specified **netdom** parameter value must be **cross**. This command cannot be used to change the **netdom** setting from **cross** to **ansi** or **itu**.

If the **settype** parameter has a value of **cdssn**, **cgpc**, **cgssn**, **opc**, **opcode**, or **dpc**, then the **ndgt** parameter cannot be specified.

The EGTT feature must be turned on prior to using this command.

The value specified for the **gttsn** parameter must match the name of an existing GTT Set.

If the VGTT feature is turned on, the **ndgt** parameter cannot be specified.

The ANSI/ITU SCCP Conversion feature must be enabled before the **netdom** parameter can be specified.

If GTAs are assigned to the GTT set, the **ndgt** parameter cannot be specified.

The **netdom=cross** parameter can be specified only if the **settype=cdgt** parameter is specified.

Output

```
chg-gttset:gttsn=acdgt:ngttsn=acdgt1
tekelecstp 10-04-28 17:58:38 EST Eagle 42.0.0
GTT-SET table is (1 of 2000) 1% full.

CHG-GTTSET: MASP A - COMPLTD
;
```

chg-gtw-stp**Change Gateway Parameters**

Use this command to modify the level 3 ANSI transfer control status (TFCSTAT) when converted from ITU to ANSI.

Keyword: **chg-gtw-stp**

Related Commands: **rtrv-gtw-stp**

Command Class: Database Administration

Parameters

:tfcstat= (mandatory)

This parameter identifies the desired level 3 control status on a TFC message received from an ITU node destined for an ANSI node.

Range: **1-3**

Example

```
chg-gtw-stp:tfcstat=1
```

Dependencies

None

Notes

None

Output

```
chg-gtw-stp: tfcstat=1

rlghncxa03w 04-01-11 11:34:04 EST EAGLE 31.3.0
CHG-GTW-STP: MASP A - COMPLTD
;
```

chg-gws-actset

Change Gateway Screening Stop Action Sets

Use this command to configure the gateway screening (GWS) stop action sets in the system database. Stop action sets are used to define the actions performed on the Message Sending Units (MSUs) that pass the gateway screening process. The GWS Stop Action table contains a maximum of 16 stop action sets, with each stop action set containing a maximum of 10 stop actions. The first three GWS stop action sets (**actid=1**, **actid=2**, and **actid=3**) are already defined with the existing GWS stop actions shown in Table 5-8.

Table 5-8. Gateway Screening Stop Action Definitions

Gateway Screening Stop Action ID	Gateway Screening Stop Action Set Name	Stop Action 1	Stop Action 2	Action Performed by the system
1	copy	copy	n/a	Copy the MSU for the STP LAN feature.
2	rdct	rdct	n/a	Redirect the MSU for the DTA feature.
3	cr	copy	rdct	Copy the MSU for the STP LAN feature and redirect the MSU for the DTA feature.

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on** in the **chg-ls** command, the GWS action in the stop action set *will* be performed at the end of the screening process.

Keyword: chg-gws-actset
Related Commands: rtrv-gws-actset
Command Class: Database Administration

Parameters

NOTE: The TIF, TIF2, and TIF3 stop actions each represent a specific TIF service. The services are provisioned using the **chg-npp-serv** command.

NOTE: Definitions of the values for the **act1 - act10** parameters are located in the *Notes* section.

:actid= (mandatory)
 The identification number of the GWS stop action set.
Range: 4-16

- :act1=** (optional)
Stop action 1.
Range: **cnf, copy, none, rdct, tlnp, tinp, tif, tif2, tif3, sccp**
Default: No change to the current value
- :act10=** (optional)
Stop action 10.
Range: **cnf, copy, none, rdct, tlnp, tinp, tif, tif2, tif3, sccp**
Default: No change to the current value
- :act2=** (optional)
Stop action 2.
Range: **cnf, copy, none, rdct, tlnp, tinp, tif, tif2, tif3, sccp**
Default: No change to the current value
- :act3=** (optional)
Stop action 3.
Range: **cnf, copy, none, rdct, tlnp, tinp, tif, tif2, tif3, sccp**
Default: No change to the current value
- :act4=** (optional)
Stop action 4.
Range: **cnf, copy, none, rdct, tlnp, tinp, tif, tif2, tif3, sccp**
Default: No change to the current value
- :act5=** (optional)
Stop action 5.
Range: **cnf, copy, none, rdct, tlnp, tinp, tif, tif2, tif3, sccp**
Default: No change to the current value
- :act6=** (optional)
Stop action 6.
Range: **cnf, copy, none, rdct, tlnp, tinp, tif, tif2, tif3, sccp**
Default: No change to the current value
- :act7=** (optional)
Stop action 7.
Range: **cnf, copy, none, rdct, tlnp, tinp, tif, tif2, tif3, sccp**
Default: No change to the current value
- :act8=** (optional)
Stop action 8.
Range: **cnf, copy, none, rdct, tlnp, tinp, tif, tif2, tif3, sccp**
Default: No change to the current value
- :act9=** (optional)
Stop action 9.
Range: **cnf, copy, none, rdct, tlnp, tinp, tif, tif2, tif3, sccp**
Default: No change to the current value
- :actname=** (optional)
The name of the GWS stop action set.
Range: *ayyyy*
One alphabetic character followed by up to five alphanumeric characters.
Default: No change to the current value

:all= (optional)

The **all=none** parameter clears all of the actions in the specified stop action set, and deletes the stop action set.

Range: none

Default: Undefined

:force= (optional)

Use the **force=yes** parameter when erasing the action set or changing the action name.

Range: yes

Example

```
chg-gws-actset:actid=4:actname=cncf:act1=cncf
```

Dependencies

At least one optional parameter must be specified.

If the **all=none** parameter is specified, then no other optional parameters can be specified.

The **actname=none** parameter cannot be specified.

The **force=yes** parameter must be specified to change an existing stop action.

The Calling Name Conversion Feature must be turned on before the CNCF stop action can be specified.

The TLNP feature must be turned on or the ISUP NP with EPAP feature must be enabled before the TLNP stop action can be specified.

The TLNP feature must be turned on before the TLNP stop action can be specified.

A specific stop action can be specified for one and only one stop action parameter for each stop action set.

The value specified for the **actname** parameter cannot already exist in the database.

A value of **copy** can be specified for only the **act1** parameter.

If the RDCT stop action is specified with other stop actions, then it must be specified with the last stop action parameter specified for the command.

The TLNP stop action cannot be specified in the same action set with the CNCF or RDCT stop action.

The TINP gateway screening stop action cannot be specified in the same action set with the CNCF gateway screening stop action.

The TINP feature must have been enabled before upgrading to Release 39.2 or later before the TINP stop action can be specified.

At least one TIF feature must be enabled before the TIF, TIF2, or TIF3 stop action can be specified.

Only one of the TIF, TIF2, TIF3, TLNP, TINP, RDCT, and SCCP stop actions can be specified in the command.

If specified, the TIF, TIF2, TIF3, TLNP, TINP, RDCT, or SCCP stop action must be the last stop action in the command.

The SCCP stop action cannot be specified in the same Action Set with the CNCF stop action.

The MTP Routed GWS Stop Action feature must be enabled before the SCCP stop action can be specified.

Notes

The GWS stop action 1 (**act1**) is the first stop action to be performed, and GWS stop action 10 (**act10**) is the last stop action to be performed on the MSU. These parameters can have the following values:

- **cncf**—Convert the PIP parameter with the GN parameter or the GN parameter with the PIP parameter in the ISUP IAM message for the Calling Name Conversion Facility feature
- **copy**—Copy the MSU for the STP LAN feature
- **none**—No action is performed on the MSU
- **rdct**—Redirect the MSU for the DTA feature
- **tif**—Apply TIF processing to MSU
- **tif2**—Apply TIF processing to MSU
- **tif3**—Apply TIF processing to MSU
- **tinp**—ISUP IAMs that pass gateway screening are intercepted by the Triggerless ISUP NP equipped EAGLE 5 ISS and converted to include the RN if the call is to a ported number. This GWS stop action applies only to the Triggerless ISUP NP feature.
- **tlnp**—ISUP IAMs that pass gateway screening are intercepted by the Triggerless LNP equipped EAGLE 5 ISS and converted to include the LRN if the call is to a ported number. This GWS stop action applies only to the Triggerless LNP feature.
- **sccp**—SCCP messages that pass gateway screening are forwarded to the SCCP card for service processing. This GWS stop action applies only to MTP routed UDT/UDTS and XUDT/XUDTS messages.

Output

```
chg-gws-actset:actid=4:actname=cncf:act1=cncf
rlghncxa03w 04-01-10 11:43:04 EST EAGLE 31.3.0
CAUTION: GWS action set may be referenced by one or more GWS rules
CHG-GWS-ACTSET: MASP A - COMPLTD
;
```

chg-gws-redirect

Change Gateway Screening Redirect

Use this command to change the provisioning data for the redirect function. The values that are specified for this command are stored in the Redirect table, and they are used to set the variable fields of the MSUs being redirected. For example, if the **ri=gt** parameter is specified, the value **gt** is set for the routing indicator in the called party address (CDPA) of the MSU being redirected.

Keyword: chg-gws-redirect

Related Commands: dlt-gws-redirect, ent-gws-redirect,

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:dpc= (optional)

Specifies the value used to set the ANSI destination point code field in the routing label of the MSU that is being redirected. The point code has subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: dpca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

Default: Current value.

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Destination point code.

:dpci= (optional)

Specifies the value used to set the ITU international destination point code field in the routing label of the MSU that is being redirected. The point code has subfields *zone-area-id*.

Range: **0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The point code **0-000-0** is not a valid point code.

zone—**0-7**

area—**000-255**

id—**0-7**

Default: Current value.

:dpcn= (optional)

Specifies the value used to set the ITU national destination point code field in the routing label of the MSU that is being redirected. The point code is in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) when the **chg-stpopts:npfnti** flexible point code option is on. A group code (*gc*) must be specified when the ITUDUPPC feature is on (*nnnnn-gc*, *m1-m2-m3-m4-gc*).

Range: **0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

Default: Current value.

:dpcn24= (optional)

Specifies the value used to set the 24-bit ITU national destination point code field in the routing label of the MSU that is being redirected. The point code has subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Default: Current value.

:enabled= (optional)

This parameter specifies whether MSUs that have passed gateway screening are redirected or routed as normal.

Range: **on, off**

- on**— redirect the MSU
off— route the MSU as normal
Default: No change to the current value
- :gta=** (optional)
 Specifies the value used to set the global title address (dialed digits) in the SCCP called party address of the MSU being redirected.
Range: 1-21 digits
- :ri=** (optional)
 This parameter specifies the value used to set the routing indicator in the SCCP called party address of the MSU being redirected.
Range: **gt, ssn**
gt— route by global title digits
ssn— route by subsystem number
Default: No change to the current value
- :ssn=** (optional)
 Specifies the value used to set the subsystem number (SSN) in the SCCP called party address of the MSU being redirected. This number is the SSN of the SCP to which all MSUs meeting the redirect criteria are to be redirected.
Range: **0-255**
Default: Current value
- :tt=** (optional)
 Identifies the type of the global title translation (GTT). It is the decimal representation of the 1-byte field used in SS7. This value is used to set the type of the GTT in the SCCP called party address of the MSU being redirected.
Range: **0-255**
Default: Current value

Example

```
chg-gws-redirect:dpc=111-222-111:ri=gt:ssn=10:tt=1:gta=180833:enabled=on
chg-gws-redirect:enabled=off
```

Dependencies

At least one optional parameter must be specified.

The **dpc/dpca/dpci/dpcn/dpcn24** parameter must be defined in the Destination table or defined as the STP site point code.

If the **dpc/dpca/dpci/dpcn/dpcn24** parameter is defined as a destination, at least one route must be defined.

The redirect function data must exist in the database before it can be changed with this command.

Notes

None

Output

```
chg-gws-redirect:dpc=111-222-111:ri=gt:ssn=10:tt=1:gta=180833:enabled=on
```

```
rlghncxa03w 04-07-10 11:43:04 EST EAGLE 31.6.0
CHG-GWS-REDIRECT: MASP A - COMPLTD
```

```
;
```

chg-inpopts**Change INP Options Command**

Use this command to provision INP-specific data. This command updates the INPOPTS table.

Keyword: chg-inpopts

Related Commands: rtrv-inpopts

Command Class: Database Administration

Parameters

NOTE: The nature of address indicator parameters (naiv or nai) and the numbering plan parameters (npv or np) can be specified using either a mnemonic or an explicit value. Both values cannot be specified at the same time for the same parameter. Table A-7 shows the mapping between the naiv and nai values. Table A-8 shows the mapping between the npv and np values.

NOTE: The options in the on and off parameters are described in the Notes section.

:cdpnnai= (optional)

Called Party Number Nature of Address indicator.

Range: 0-127

The following **cdpnnai** parameter values are valid for this feature:

· 1 (Subscriber), 2 (Unknown), 3 (National), and 4 (International)

Default: No change to the current value

:cdpnpx= (optional)

Called Party Number Prefix.

Range: 1-15 digits

Valid digits are **0-9, A-F, a-f**.

Default: No change to the current value

:defrn= (optional)

Default routing number. This parameter specifies a default routing number that is used for own-network subscribers.

Range: 1-15 digits, none

Valid digits are **0-9, a-f, A-F**.

Default: No change to the current value

System

Default: none

:dltpfx= (optional)

Delete prefix.

Range: yes, no

Default: no

:dra= (optional)

Destination routing address. This parameter specifies the routing address format supported in INP "Connect" response messages.

Range: rndn, rn, ccrndn, rnecdn, homerndn, rnasd, asdrn, rnasddn, asdrndn, ccrnasddn, asdrnccdn, ccasdrndn, rnasdcdn, rnasdnecdn, asdrnecdn, rngrn, grnrn, rngrndn, grnrndn, ccrngrndn, ccgrnrndn, grnrnccdn, rngrnecdn, rngrnecdn, grnrnecdn, grn, grndn, ccgrndn

rndn — RN + [CDPNPFX] + DN

rn — Routing Number

ccrndn — [CDPNPFX] + CC + RN + DN
rnnecdn — RN+ [CDPNPFX]+ NEC+ DN
homerndn — Home Routing Number
rnasd — RN + ASD
asdrn — ASD + RN
rnasddn — Supports RN+ASD+ [CDPNPFX] + DN in the INP "CONNECT" response messages.
asdrndn — Supports ASD+ RN + [CDPNPFX] + DN in the INP "CONNECT" response messages.
ccrnasddn — Supports [CDPNPFX] +CC + RN + ASD+DN in the INP "CONNECT" response messages.
asdrnccdn — Supports ASD+ RN+ [CDPNPFX]+ CC+ DN in the INP "CONNECT" response messages.
ccasdrndn — Supports [CDPNPFX] +CC + ASD + RN+DN in the INP "CONNECT" response messages.
rnasdccdn — Supports RN + ASD + [CDPNPFX] +CC + DN in the INP "CONNECT" response messages.
rnasdnecdn — RN + ASD + [CDPNPFX] + NEC + DN
asdrnecdn — ASD + RN+ [CDPNPFX]+ NEC+ DN
rngrn — RN + GRN
grnrn — GRN + RN
rngrndn — RN + GRN + [CDPNPFX] + DN
grnrndn — GRN + RN + [CDPNPFX] + DN
ccrngrndn — [CDPNPFX] + CC + RN + GRN + DN
ccgrnrndn — [CDPNPFX] + CC + GRN + RN + DN
grnrnccdn — GRN + RN + [CDPNPFX] + CC + DN
rngrnccdn — RN + GRN + [CDPNPFX] + CC + DN
rngrnecdn — RN + GRN + [CDPNPFX] + NEC + DN
grnrnecdn — GRN + RN + [CDPNPFX] + NEC + DN
grn — GRN
grndn — GRN + [CDPNPFX] + DN
ccgrndn — [CDPNPFX] + CC + GRN + DN

Default: No change to the current value

System

Default: **rndn**

:dranai= (optional)

Nature of Address indicator.

Range: **sub, unknown, natl, intl, ntwk**

Default: No change to the current value

:dranaiv= (optional)

Nature of Address indicator value.

Range: **0-127**

:dranp= (optional)

Numbering plan.

Range: **e164, x121, f69**

Default: Current value

:dranpv= (optional)

Numbering plan value.

Range: **0-7**

Default: No change to the current value

- :ncdnpfx=** (optional)
New Called Party Number Prefix.
Range: 1-15 digits, **none**
Valid digits are **0-9, a-f, A-F**.
- :nec=** (optional)
National Escape Code.
Range: 1-5 digits, **none**
Valid digits are **0-9, A-F, a-f**.
Default: **none**
- :off=** (optional)
This parameter turns off the specified options. Up to 8 comma-separated unique options can be specified.
Range: **cutnpaste**
- :on=** (optional)
This parameter turns on the specified options. Up to 8 comma-separated unique options can be specified.
Range: **cutnpaste**
- :relcause=** (optional)
Release cause. This parameter specifies the reason for releasing the call when an INP Circular Route is detected.
Range: **1-127**
Default: **31** - normal, unspecified
- :snai=** (optional)
Service Nature of Address indicator.
Range: **sub, natl, intl, none, unknown**
Default: No change to the current value
- :sporttype=** (optional)
Service Portability type. This parameter specifies whether Service Portability is performed for the associated feature.
NOTE: The S-Port feature must be turned on before any change to the parameter will impact the associated feature.
NOTE: If Service Portability is performed, then the Service Portability prefix (RTDB 'GRN'entity id) is applied.
Range: **gsm, is41, all, none**
gsm, none— Apply Service Portability prefix for own-network GSM subscribers
is41, none— Apply Service Portability prefix for own-network IS41 subscribers
all, none— Apply Service Portability prefix for all own-network (IS41 and GSM) subscribers
none—Service Portability is not performed for the feature.
Default: No change to the current value
System
Default: **none**
- :sprestype=** (optional)
INP option that indicates the type of message the EAGLE 5 ISS is to send when an IDP message is received for INP service, the DN digits match, and the HLR ID is present.
Range: **connect, continue**
connect— send a CONNECT message

continue — send a CONTINUE message
Default: **continue**

```

Dependencies

At least one optional parameter must be specified.

The **dranp** and **dranpv** parameters cannot be specified together in the command.

The **dranai** and **dranaiv** parameters cannot be specified together in the command.

If the **ncdpnpx** or **dltplx** parameter is specified, the **cdpnpx** parameter must be specified.

A value of **none** cannot be specified for the **cdpnpx** parameter.

If the **ncdpnpx=none** parameter is specified, then the **dltplx** parameter cannot be specified.

The value specified for the **cdpnpx** parameter must already exist in the INPOPTS table.

The value specified for the **ncdpnpx** parameter cannot already exist in the INPOPTS table.

A maximum of 5 Called Party Number Nature of Address values is allowed.

The **cdpnai** and **snai** parameters must be specified together in the command.

If this command is entered to delete a CdPN Nature of Address value from the INPOPTS table, then the value specified for the **cdpnai** parameter must already exist in the INPOPTS table.

A valid value must be specified for the **nec** parameter.

A maximum of 40 Called Party Number Prefix values can be provisioned.

If the **nec=none** parameter is specified, then values of **asdrnecdn**, **rnsdnecdn**, **rnnecdn**, **rngrnecdn**, and **grnrnecdn** cannot be specified for the **dra** parameter.

The INP CRP feature must be enabled before the **relcause** parameter can be specified.

The S-Port feature must be enabled before the **sporttype** parameter can be specified.

The INP feature must be enabled before this command can be entered.

The same option cannot be specified for the **on** and **off** parameters.

Notes

on/off options

- **cutnpaste**—Specifies whether the CutAndPaste parameter is included in an INP CONNECT response message. The value for the CutAndPaste parameter is the length of the incoming DN in the IDP query. If the **cutnpaste** option is provisioned, then this value is cut from the CdPN. The remaining digits are pasted to the end of the DRA digits sent by the STP in the CONNECT response to form the new routing digits. This option has a default of OFF.

Output

```
chg-inopts :dra=rngrn :nec=0
tekelecstp 09-05-05 12:20:32 EST EAGLE 41.1.0
CHG-INOPTS: MASP A - COMPLTD
;
```

chg-ip-card

Change Internet Protocol Card

Use this command to provision IP networking parameters for a given card.

Keyword: **chg-ip-card**

Related Commands: **chg-sg-opts**, **rtrv-ip-card**

Command Class: Database Administration

Parameters

:loc= (mandatory)

Card location. The unique identifier of a specific application subsystem located in the STP.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118, 1113, 1115

:bpipaddr= (optional)

Bonded Port IP address. This parameter specifies an IP address for the card in the specified location.

Range: 4 numbers separated by dots, with each number in the range of **0-255**.
A value of **0.0.0.0** removes the IP address.

Default: No change to the current value

:bpsubmask= (optional)

Bonded Port IP submask.

Range: The value must be valid for the class of the entered IP address.

Table 5-9. Valid Subnet Mask Values

Valid for Class A Networks	Valid for Class A or B Networks	Valid for Class A, B, or C Networks
255.0.0.0	255.255.0.0	255.255.255.0
255.192.0.0	255.255.192.0	255.255.255.192
255.224.0.0	255.255.224.0	255.255.255.224
255.240.0.0	255.255.240.0	255.255.255.240
255.248.0.0	255.255.248.0	255.255.255.248
255.252.0.0	255.255.252.0	255.255.255.252
255.254.0.0	255.255.254.0	
255.255.128.0	255.255.255.128	

:defrouter= (optional)

Default router IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is 192.126.100.5, where 192.126.100 is the network number and 5 is the machine's host number.

Range: 4 numbers separated by dots, with each number in the range of **0-255**.

A value of **0.0.0.0** will remove an IP address from this parameter.

Default: No change to the current value

System

Default: **0.0.0.0**

:dnasa= (optional)

IP address for Domain Name Server A. TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is 192.126.100.5, where 192.126.100 is the network number and 5 is the machine's host number.

Range: 4 numbers separated by dots, with each number in the range of **0-255**.

A value of **0.0.0.0** will remove an IP address from this parameter.

Default: No change to the current value

System

Default: **0.0.0.0**

:dnspb= (optional)

IP address for Domain Name Server B. TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is 192.126.100.5, where 192.126.100 is the network number and 5 is the machine's host number.

Range: 4 numbers separated by dots, with each number in the range of **0-255**.

A value of **0.0.0.0** will remove an IP address from this parameter.

Default: No change to the current value

System
Default: 0.0.0.0

:domain= (optional)

Domain name of the Domain server.

Range:
 Any string of characters beginning with a letter and comprising up to 120 characters in length.
 Valid characters are **a-z, A-Z, 0-9, -** (dash), **.** (period).

Default: No change to the current value

System

Default: Null

:rstdomain= (optional)

Reset Domain Name. This parameter is used to reset the Domain Name to a NULL value.

Range: **yes, no**
yes—reset Domain Name to a NULL value
no—Domain Name does not change

Default: **no**

:sctpcsum= (optional)

SCTP checksum algorithm. This parameter specifies the configured SCTP checksum algorithm for a specific card.

The system-wide setting for the SCTP checksum algorithm type (see the **chg-sg-opts** command) takes precedence over the setting for an individual card. The **chg-sg-opts:sctpcsum=percard** command must be entered before the **chg-ip-card:sctpcsum=** command can be entered.

Range: **adler32, crc32c**

System

Default: **crc32c**

:srchordr= (optional)

Host table search order.

Range: **local, srvr, srvronly**
local—Local host table is searched first.
srvr—Domain Server is searched first.
srvronly—Only the Domain Server is searched.

Default: No change to the current value

System

Default: No search

Example

```
chg-ip-  
card:loc=1211:dnsa=150.1.1.1:domain=nc.tekelec.com:defrouter=150.  
1.1.105  
chg-ip-card:loc=1107:sctpcsum=adler32
```

Dependencies

At least one optional parameter must be specified.

The value specified for the **loc** parameter must correspond to the location of a card that can run an IP application (other than the **eroute** application, which is not supported by this command). For a list of the cards and their associated applications, see Table A-9.

The card in the location specified by the **loc** parameter must be inhibited before this command can be entered.

If the **domain** parameter is specified, the **rstdomain** parameter cannot be specified.

The **defrouter** IP address must be local to the Ethernet A network or Ethernet B network for the card. The B network can be used only on SSEDCEM, E5-ENET, and E5-ENET-B cards.

If the card in the location specified by the **loc** parameter is not an E5-SM4G or E5-SM8G-B card, or if a DSM card is provisioned in the system, then the **bpipaddr** and **bpsubmask** parameters cannot be specified.

The IP address specified by the **bpipaddr** and **bpsubmask** parameters must be unique.

The **bpipaddr** parameter must be specified before the **bpsubmask** parameter can be specified.

A valid value must be specified for the **bpsubmask** parameter.

If the **bpipaddr** parameter is specified, then the **bpsubmask** parameter must be specified.

The **chg-sg-opts:sctpsum=percard** command must be entered before the **sctpsum** parameter can be specified in the **chg-ip-card** command.

Notes

The Domain Name has a 120 character limitation.

Output

```
chg-ip-
card:loc=1211:dnsa=150.1.1.1:domain=nc.tekelec.com:defrouter=150.
1.1.105:sctpcsum=adler32
      rlgncxa03w 08-02-22 15:35:05 EST  EAGLE 38.0.0
      CHG-IP-CARD: MASP A - COMPLTD
;
```

chg-ip-lnk

Change Internet Protocol Link

Use this command to provision the IP link table.

Keyword: **chg-ip-lnk**

Related Commands: **rtrv-ip-lnk**

Command Class: Database Administration

Parameters

:loc= (mandatory)

Card location. The unique identifier of a specific application subsystem located in the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118, 1113, 1115

:port= (mandatory)

Ethernet interface Port ID.

Range: a, b

Port **b** is not valid for SS7IPGW and IPGWI applications with associations.

:auto= (optional)

Tells hardware whether to automatically determine duplex and speed.

Range: yes, no

yes — Automatically determines duplex and speed

no — Do not automatically determine duplex and speed
Default: No change to the parameter value
System
Default: **no**

:duplex= (optional)

This is the mode of operation of the interface.

Range: **half, full**
half — Half duplex
full — Full duplex

Default: No change to the parameter value
System
Default: **full**

:ipaddr= (optional)

The IP address for the specified port. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is 192.126.100.5, where 192.126.100 is the network number and 5 is the machine's host number.

Range: 4 numbers separated by dots, with each number in the range of **0-255**.
A value of **0.0.0.0** will remove an IP address from this parameter.

Default: No change to the parameter value.
System
Default: **0.0.0.0**

:mactype= (optional)

The Media Access Control Type of the interface.

Range: **802.3, dix**
802.3 — The IEEE standard number 802.3 for Ethernet 1
dix — The Digital/Inter/Xerox *de facto* standard for Ethernet 2

Default: No change to the parameter value
System
Default: **dix**

:mcast= (optional)

Multicast Control. This parameter enables or disables multicast support for the interface. This parameter is necessary for INP, G-Port, and G-Flex to establish the connection from the Service Module card to the MPS system.

Range: **yes, no**
yes — Multicasting is enabled on the interface and the sending and receiving of multicast frames is allowed.
no — All multicast frames are silently dropped.

System
Default: **no**

:speed= (optional)

The bandwidth for the interface in megabits per second

Range: **10, 100**
Default: No change to the parameter value
System
Default: **100**

:submask= (optional)

The subnet mask of the IP interface in the form of an IP address with a restricted range of values. This parameter is mandatory when the **ipaddr** parameter is specified.

Range: The value must be valid for the class of the entered IP address.

Table 5-10. Valid Subnet Mask Values

Valid for Class A Networks	Valid for Class A or B Networks	Valid for Class A, B, or C Networks
255.0.0.0	255.255.0.0	255.255.255.0
255.192.0.0	255.255.192.0	255.255.255.192
255.224.0.0	255.255.224.0	255.255.255.224
255.240.0.0	255.255.240.0	255.255.255.240
255.248.0.0	255.255.248.0	255.255.255.248
255.252.0.0	255.255.252.0	255.255.255.252
255.254.0.0	255.255.254.0	
255.255.128.0	255.255.255.128	

Default: If **ipaddr** is not specified, there is no change to the parameter value.
 When a host's IP address is known, the default subnet mask should be chosen according to Table 5-11.

Table 5-11. Default Subnet Mask Values

Network Class	IP Network Address Range	Default Subnet Mask
A	1.0.0.0 to 127.0.0.0	255.0.0.0
B	128.0.0.0 to 191.255.0.0	255.255.0.0
C	192.0.0.0 to 223.255.255.0	255.255.255.0

System Default: 0.0.0.0

Example

chg-ip-lnk:loc=1211:port=A

Dependencies

- The value specified for the **ipaddr** parameter must already exist in the Host table.
- Each IP address entered into the IP Link table must be unique.
- At least one optional parameter must be specified.
- If the **auto** parameter is specified, then the **duplex** and **speed** parameters cannot be specified.
- The value specified for the **loc** parameter must correspond to the location of a card that can run an IP application (other than the **eroute** application, which is not supported by this command). For a list of the cards and their associated applications, see Table A-9.

The card in the location specified by the **loc** parameter must be inhibited before this command can be entered.

For IPGWx cards, associations on port **b** are not allowed.

The local **ipaddr** and **submask** values of either the A or B network cannot be changed to an address that represents a different network if a default router and/or other gateway routers are assigned to the current local network (display with **rtrv-ip-card** and **rtrv-ip-rte**).

The local IP address cannot be changed if the current or new local host has open sockets or associations (the **open** parameter set to **yes** with the **ent-assoc** or **chg-assoc** command).

The IP address of an existing IP link entry in the IP Link table cannot be changed if it exists in the IP Host table.

An IP link entry must be provisioned in the IP Link table before an IP host entry can be provisioned with a corresponding IP address in the IP Host table.

The IP host entry must be deleted from the IP Host table before an IP link entry can be deleted from the IP Link table.

An existing IP link entry in the IP Link table cannot be deleted (**ipaddr=0.0.0.0**) if it exists in the IP Host table.

The IP network address specified by the **ipaddr** and **submask** parameters must be different from the PVN and fast copy network addresses specified by the **pvn/pvnmask**, **fcna/fcnamask**, and **fcnb/fcnbmask** parameters (see the **chg-netopts** command).

The card in the location specified by the **loc** parameter must support the port specified by the **port** parameter.

The **ipaddr** and **submask** parameters must be specified together in the command.

Notes

None

Output

```
chg-ip-lnk:loc=1211:port=a

rlghncxa03w 04-01-17 15:35:05 EST EAGLE 31.3.0
CHG-IP-LNK: MASP A - COMPLTD
;
```

chg-is41-msg

Change IS41 test message

Use this command to provision IS41 test messages. These messages are used by the MO SMS NPP Test Tool to test MO-based IS41 SMS message processing by the NPP.

Keyword: **chg-is41-msg**

Related Commands: **rtrv-is41-msg**, **tst-msg**

Command Class: Database Administration

Parameters

:msgn= (mandatory)

Message number. This parameter specifies the test message number that will be changed.

Range: **1-10**

:active= (optional)

This parameter specifies whether the IS41 MOSMS message can be sent to the network card for processing.

Range: **yes, no**

yes — The message is sent to the network card.
no — The message is not sent to the network card.

Default: No change to the current value

System

Default: **no**

:cdpadgts= (optional)

Called party address digits. This parameter specifies the SCCP CdPA digits for the IS41 test message.

Range: 1-15 digits

1 - 15 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.

Default: No change to the current value

System

Default: **0123456789abcde**

:cdpagti= (optional)

Called party address global title indicator. This parameter specifies the SCCP CdPA GT for the IS41 test message.

Range: **0-15**

Default: No change to the current value

System

Default: **4**

:cdpagtnai= (optional)

Called party address global title nature of address indicator. This parameter specifies the SCCP CdPA GT NAI for the IS41 test message.

Range: **0-127**

Default: No change to the current value

System

Default: **4**

:cdpndgts= (optional)

Called party number digits. This parameter specifies the TCAP CdPN (*SMS_DA* / *SMS_ODA*) digits for the IS41 test message.

Range: 1-21 digits

Default: No change to the current value

System

Default: **01234567890abcde**

:cdpnnes= (optional)

Called party number encoding scheme. This parameter specifies the TCAP CdPN (*SMS_DA* / *SMS_ODA*) encoding scheme for the IS41 test message

Range: **0-15**

Default: No change to the current value

System

Default: **1**

:cdpnnai= (optional)

Called party number nature of address indicator. This parameter specifies the TCAP CdPN (*SMS_DA* / *SMS_ODA*) NAI for the IS41 test message.

Range: **0-1**

Default: No change to the current value

System

Default: **1**

:cdpnp= (optional)

Called party numbering plan. This parameter specifies the TCAP CdPN (*SMS_DA* / *SMS_ODA*) NP for the IS41 test message.

Range: 0-15

Default: No change to the current value

System

Default: 2

:cgpadgts= (optional)

Calling party address digits. This parameter specifies the SCCP CgPA digits for the IS41 MOSMS message.

Range: 1-15 digits

Range is 1 - 15 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.

Default: No change to the current value

System

Default: 0123456789abcde

:cgpagti= (optional)

Calling party address global title indicator. This parameter specifies the SCCP CgPA GT for the IS41 test message.

Range: 0-15

Default: No change to the current value

System

Default: 4

:cgpagnai= (optional)

Calling party address global title nature of address indicator. This parameter specifies the SCCP CgPA GT NAI for the IS41 test message.

Range: 0-127

Default: No change to the current value

System

Default: 4

:cgpndgts= (optional)

Calling party number digits. This parameter specifies the TCAP CgPN (*SMS_OOA*) digits for the IS41 test message.

Range: 1-21 digits, **none**

none—deletes the current digits

Default: No change to the current value

System

Default: 01234567890abcde

:cgpnes= (optional)

Calling party number encoding scheme. This parameter specifies the TCAP CgPN (*SMS_OOA*) encoding scheme for the IS41 test message

Range: 0-15

Default: No change to the current value

System

Default: 1

:cgpnnai= (optional)

Calling party number nature of address indicator. This parameter specifies the TCAP CgPN (*SMS_OOA*) NAI for the IS41 test message.

Range: 0-1

Default: No change to the current value
System Default: 1

:cgpnp= (optional)

Calling party numbering plan. This parameter specifies the TCAP CgPN (*SMS_OOA*) NP for the IS41 test message.

Range: 0-15
Default: No change in the current value
System Default: 2

:reset= (optional)

This parameter resets all of the parameters to their default values.

Range: yes, no
yes — All of the message parameters are reset to their default values.
no — None of the message parameters are reset.
Default: No change to the current value

Example

```
chg-is41-msg:msgn=1:cdpnnai=1:cdpadgts=12457896abcd:cgpnnai=1
chg-is41-msg:msgn=1:cdpnnai=1:cdpndgts=981123456
```

Dependencies

If the **reset** parameter is specified, then no other parameters can be specified.

At least one optional parameter must be specified.

Output

```
chg-is41-msg:msgn=1:cdpnnai=1:cdpndgts=987654321:cgpnnai=1
tekelecstp 09-03-02 10:46:51 EST EAGLE 40.1.0
CHG-IS41-MSG: MASP A - COMPLTD
```

;

chg-is41opts

Change IS41 Options

Use this command to change the values of one or more of the IS41 option indicators maintained in the IS41 Options (IS41OPTS) table.

Keyword: chg-is41opts

Related Commands: chg-is41smsopts, rtrv-is41opts, rtrv-is41smsopts

Command Class: Database Administration

Parameters

NOTE: The options for the on and off parameters are described in the Notes section.

:dfitrn= (optional)

Default routing number. This parameter specifies the routing digits if Service Portability is not applicable.

Range: 1-15 digits, none
 1 - 15 hexadecimal digits. Valid digits are 0-9, a-f, A-F.

:esnmfg= (optional)

ESN manufacturer code. This parameter specifies the value that will be encoded in the manufacturer code section of the **esn** parameter for a LOCREQ response message.

Range: 0-255

Default: 0

:esnsn= (optional)

ESN serial number. This parameter specifies the value that will be encoded in the serial number section of the **esn** parameter for a LOCREQ response message.

Range: 0-16777215

Default: 0

:iec= (optional)

International escape code. This parameter specifies the international escape code that a received LOCREQ message can contain and have lookup performed.

Range: 1-5 digits, **none**

none—Removes the IEC from a received LOCREQ message before lookup.

Default: **none**

:locreqdn= (optional)

This parameter specifies whether to obtain the Called Party, used for database lookup, from the SCCP or TCAP layer of a received LOCREQ message.

Range: **tcap, sccp**

tcap— Obtains the Called Party from the TCAP layer.

sccp— Obtains the Called Party from the SCCP layer.

Default: **sccp**

:locreqrmhrn= (optional)

LOCREQ remove HomeRN. This parameter specifies whether to remove the HomeRN from the TCAP Outgoing Called Party for a relayed LOCREQ message.

Range: **yes, no**

yes— Remove HomeRN.

no— Do not remove HomeRN.

Default: **no**

:mscmktid= (optional)

MSCID market ID. This parameter specifies the value that will be encoded in the Market ID section of the **mscid** parameter for a response LOCREQ message.

Range: 0-65535

Default: 0

:mscswitch= (optional)

MSCID market ID switch. This parameter specifies the value that will be encoded in the Market ID Switch section of the **mscid** parameter for a response LOCREQ message.

Range: 0-255

Default: 0

:mtplocreqlen= (optional)

This parameter specifies the number of terminating called party digits to extract from the LOCREQ message.

Range: 5-15

Default: 15

System

Default: 0

:mtplocreqnai= (optional)

MTP-routed LOCREQ nature of address indicator. This parameter specifies how the Called Party from the TCAP layer of a received MTP-routed LOCREQ message will be interpreted.

Range: **ccrndn, frmsg, intl, natl, rnidn, rnrndn, rnsdn, sub, locreqlen**

ccrndn— Country code, routing number, and national directory number
frmsg— Incoming message value.
intl— International number
natl— National number
rnidn— Routing number prefix and international dialed/directory number
rnndn— Routing number prefix and national dialed/directory number
rnsdn— Routing number prefix and subscriber dialed/directory number
sub— Subscriber number
locreqlen— Number of terminating called party digits specified by the **locreqlen** parameter

Default: **frmsg**

:nec= (optional)

National escape code. This parameter specifies the national escape code that a received LOCREQ message can contain and have lookup performed.

Range: 1-5 digits, **none**
none—Removes the NEC from the received LOCREQ message before database lookup.

Default: **none**

:off= (optional)

This parameter turns off the specified options. Up to 8 comma-separated options can be specified.

Range: **smsreqbypass, locreqrmhrn, locreqrspnd**

:on= (optional)

This parameter turns on the specified options. Up to 8 comma-separated options can be specified.

Range: **smsreqbypass, locreqrmhrn, locreqrspnd**

:rspcdpapcp= (optional)

Response called party point code present. This parameter specifies the point code present bit that will encode the SCCP CdPA GTA of a LOCREQ response message.

Range: **off, on, frmsg**
off— The response will not contain a point code present bit.
on— The point code in the SCCP CgPA of the received LOCREQ message will be used. If no point code is present, the originating point code in the MTP Routing Label will be used.
frmsg— The point code present bit from the received message will be used. Override does not occur.

Default: **off**

:rspcdpari= (optional)

Response called party routing indicator. This parameter specifies the value of the routing indicator bit that will encode the SCCP CdPA GTA of a LOCREQ response message.

Range: **frmsg, gt, ssn**
frmsg— The received message routing indicator bit will be used. Override does not occur.
gt— The GTA digits in the SCCP CgPA GTA of the received message will be used. If no GTA digits are present in the SCCP CgPA GTA, override will occur according to the **cdpari=ssn** parameter.
ssn— The SCCP CgPA of the received message will be used.

Default: **frmsg**

:rspcgpanai= (optional)

Response calling party nature of address indicator. This parameter specifies the nature of address (NAI) that will encode the SCCP CgPA GTA of a LOCREQ response message.

Range: **0-127, none**
none—The NAI value in the SCCP CdPA of the received message will be used.
 Override does not occur.

Default: **none**

:rspcgpanp= (optional)

Response calling party numbering plan. This parameter specifies the numbering plan (NP) that will encode the SCCP CgPA GTA of a LOCREQ response message.

Range: **0-15 none**
none—The NP in SCCP CdPA of the received message will be used. Override does not occur.

Default: **none**

:rspcgpapcp= (optional)

Response calling party point code present. This parameter specifies the point code present bit that will encode the SCCP CgPA GTA of a LOCREQ response message.

Range: **frmsg, on, off**
frmsg — The point code present bit from the received message will be used.
on — The point code in the SCCP CdPA of the incoming LOCREQ message will be used. If no point code is present, the destination point code in the MTP Routing Label will be used.
off — The response message will not contain a point code present bit.

Default: **frmsg**

:rspcgpari= (optional)

Response calling party routing indicator. This parameter specifies the routing indicator bit that will encode the SCCP CgPA GTA of a LOCREQ response message.

Range: **frmsg, gt, ssn**
frmsg — The value from the received message will be used. Override does not occur.
gt — The GTA digits in the SCCP CdPA GTA of the received message will be used. If no GTA digits are present, override occurs according to the **cgpari=ssn** parameter.
ssn — The SCCP CdPA of the received message will be used.

Default: **frmsg**

:rspcgpatt= (optional)

Response calling party translation type. This parameter specifies the translation type (TT) that will encode the SCCP CgPA GTA of a LOCREQ response message.

Range: **0-255 none**
none—The TT in the SCCP CdPA of the received message will be used. Override does not occur.

Default: **none**

:rspdig= (optional)

Routing number. This parameter specifies the digit encoding format of the TCAP Outgoing Called Party parameter for a LOCREQ response message.

The routing number will be used as is or concatenated with the Called Party Number. The routing number format will be used on a per EAGLE 5 ISS node basis.

Range: **ccrndn, hrrndn, rn, rndn**
ccrndn — Country Code + RN + DN
hrrndn — HomeRN + RN + DN
rndn — RN + DN

Default: **rn**

:rspdigtype= (optional)

Response digit type. This parameter specifies the value that will encode the Digit Type field in the TCAP Outgoing Called Party parameter of a LOCREQ response message.

Range: 0-255

Default: 6

:rspmin= (optional)

Response LOCREQ MIN parameter encoding. This parameter specifies how the **min** parameter of a LOCREQ response message will be encoded.

Range: **homern, nothomern, tendelhomern, tenhomern, tenzero**

homern— The exact number of digits, with home RN prefix, as encoded in the Called Party of the received LOCREQ message.

nothomern— The exact number of digits, without home RN prefix, as encoded in the Called Party of the received LOCREQ message.

tendelhomern— The leading 10 digits of the Called Party of the received LOCREQ message after deleting the home RN prefix, if it exists.

tenhomern— The leading 10 digits the Called Party of the received LOCREQ message without deletion of the home RN prefix.

tenzero— 10 digits filled with 0.

Default: **homern**

:rspnon= (optional)

MSRN nature of number. This parameter specifies the nature of number value that will encode the TCAP Outgoing Called Party parameter of a LOCREQ response message.

Range: 0-255 **none**

none—The NAI value in the Digits[Dialed] parameter of a received LOCREQ message is used.

Default: **none**

:rspnp= (optional)

MSRN numbering plan. This parameter specifies the numbering plan that will encode the TCAP Outgoing Called Party parameter of the LOCREQ response message.

Range: 0-15 **none**

2—Telephony Numbering

Default: 2

:rspparm= (optional)

Response parameter. This parameter specifies the TCAP parameter that will encode the RN and/or DN information for a LOCREQ response message.

This value encodes the DigitType field of the TerminationList, RoutingDigits, or Digits[Destination] on a per EAGLE 5 ISS node basis.

Range: **ddigit, rtdigit, tlist**

ddigit— Digits[Destination].

rtdigit— Routingdigits

tlist— Termination list (Default)

Default: **tlist**

:smsreqbypass= (optional)

This parameter specifies whether a received SMSREQ message that passes the MNP Service Selector (**serv=mnp** parameter in the **chg-sccp-serv** command) will undergo A-Port message processing.

Range: **yes, no**

yes— Bypass A-Port.

no— Do not bypass A-Port.

Default: **no**

:sporttype= (optional)

Service Portability Type. This parameter specifies the application of Service Portability that is applied to the associated feature.

The S-Port feature must be enabled before this parameter can be specified. The S-Port feature must be turned on before any change to the parameter will impact the associated feature.

If Service Portability is performed, then the Service Portability prefix (RTDB 'GRN' entity id) is applied.

Range: **none, gsm, is41, all**
none — Service Portability is not performed for the feature.
gsm — apply Service Portability prefix for own-network GSM subscribers
is41 — apply Service Portability prefix for own-network IS41 subscribers
all — apply Service Portability prefix for all own-network (IS41 and GSM) subscribers

Default: No change to the current value

System

Default: **none**

:tcapsnai= (optional)

This parameter specifies how the Called Party from the TCAP layer of a received LOCREQ message will be interpreted.

Range: **ccrndn, frmmsg, intl, natl, rnidn, rnrndn, rnsdn, sub**
ccrndn — Country code, routing number, and national directory number
frmmsg — Incoming message value
intl — International number
natl — National number
rnidn — Routing number prefix and international dialed/directory number
rnrndn — Routing number prefix and national dialed/directory number
rnsdn — Routing number prefix and subscriber dialed/directory number
sub — Subscriber number

Default: **frmmsg**

Example

```
chg-is41opts:iec=12345:nec=12345:rspcgpari=gt:rspcdpari=gt
chg-is41opts:rspnon=1:tcapsnai=sub:mscmktid=78
chg-
is41opts:locreqdn=tcap:rspcgpapcp=frmmsg:rspnp=14:rspmin=tendelhom
ern
chg-is41opts:smsreqbypass=yes:rspcdpapcp=off
chg-is41opts:rspcgpanai=120:rspcgpanp=5:rspcgpatt=25
chg-is41opts:mtplocreqnai=intl:rspparm=tlist:rspdig=rn
chg-is41opts:rspnon=25:mscmktid=535:msscswitch=55
chg-is41opts:esnmfg=159:esnsn=7215:rspdigtype=67:locreqrmhrn=yes
chg-
is41opts:sporttype=gsm:dfltrn=48607:on=smsreqbypass,locreqrspnd
```

Dependencies

The A-Port or IS41 GSM Migration (IGM) feature must be enabled before this command can be entered.

The Service Portability and LOCREQ Query Response features must be enabled before the **sporttype** parameter can be specified.

The **smsreqbypass** and **locreqrmhrn** parameters and the **on** or **off** parameter cannot be specified in the same command.

The LOCREQ Query Response feature must be enabled before the **dfltrn** parameter can be specified.

The LOCREQ Query Response feature must be turned on before the **locreqrspnd** option can be specified for the **on** or **off** parameter.

The same option cannot be specified for the **on** and **off** parameters.

Notes

on/off options

- **smsreqbypass**—Specifies whether a received SMSREQ message that passes the MNP Service Selector (see the **chg-sccp-serv** command) undergoes A-Port message processing. This option has a default of OFF.
- **locreqrmhrn**—LOCREQ remove HomeRN. Specifies whether to remove the HomeRN from the TCAP Outgoing Called Party for a relayed LOCREQ message. This option has a default of OFF.
- **locreqrspnd**—Specifies whether the system should always respond to a LOCREQ query. This option has a default of OFF.

Output

```
chg-is41opts:smsreqbypass=yes
tekelecstp 06-09-11 15:13:20 EST EAGLE 36.0.0
Command entered at terminal #4.
CHG-IS41OPTS: MASP A - COMPLTD
```

;

chg-is41smsopts

Change IS41 SMS System Options

Use this command to enter IS41 SMS system options in the database. This command updates the IS41SMSOPTS table.

Keyword: **chg-is41smsopts**

Related Commands: **chg-is41opts**, **rtrv-is41opts**, **rtrv-is41smsopts**

Command Class: Database Administration

Parameters

:bpartygttsn= (optional)

MO SMS B-Party Routing GTT Set name. This parameter specifies the GTT set where Global Title Translation lookup on B-Party digits is performed.

Range: *ayyyyyyy*

1 leading alphabetic and up to 8 following alphanumeric characters.

Default: No change to the current value

System

Default: **none**

:defrn= (optional)

Default routing number. This parameter specifies a default routing number that is used for own-network subscribers.

Range: 1-15 digits, **none**

Valid digits are **0-9**, **A-F**, **a-f**.

Default: No change to the current value

System

Default: **none**

:modaparam= (optional)

This parameter specifies whether the SMS_DestinationAddress or SMS_OriginalDestinationAddress parameter from the IS41 SMDPP message is used for conditioning, lookup, and modification for the MO-based IS41 SMS NP and MO SMS IS41-to-GSM Migration features.

Range: **da, oda**
 da — Destination Address
 oda — Original Destination Address

Default: No change to the current value

System

Default: **da**

:moigmpfx= (optional)

MO SMS IS41-to-GSM migration prefix. This parameter specifies whether the MO SMS IS41-to-GSM Migration feature uses digits from the RTDB network entity (NE) associated with the B number or the **is412gsm** parameter (see the **chg-gsmopts** command) as a prefix to modify the destination address in the outgoing SMDPP.

Range: **ne, is412gsm**
 ne — The RTDB NE data associated with the B number is used for prefixing.
 is412gsm — The provisioned IS412GSM migration prefix is used for prefixing.

Default: No change to the current value

System

Default: **ne**

:mosmsaclen= (optional)

This parameter specifies the number of the digits that are taken from the MO SMS CgPA and used as the Area Code in the MO SMS CdPA.

Range: **0-8**

Default: No change to the current value

System

Default: **0**

:mosmsdigmat= (optional)

This parameter specifies that the “HomeSMSC Match with Digits” search option can be used with the MO-based IS41 SMS NP and MO SMS IS41-to-GSM Migration features.

Range: **exact, bestfit, bypass**
 exact — The system searches for an exact match of digits in the HomeSMSC Table.
 bestfit — The system searches for a match on the leading digits of an incoming message with any provisioned entry in HomeSMSC table if an exact match is not found.
 bypass — The HomeSMSC search is not performed.

Default: No change to the current value

System

Default: **exact**

:mosmsgttdig= (optional)

MO SMS B-Party Routing GTT digit. This parameter specifies the digits that are used for Global Title Translation.

Range: **sccpcdpa, mapbparty**
 sccpcdpa — The SCCP CdPA is used for GTT.
 mapbparty — The MAP B-Party number is used for GTT.

Default: No change to the current value

System

Default: **sccpcdpa**

:mosmsnai= (optional)

MO-based SMS Nature Address Indicator. This parameter specifies the number conditioning that is performed on the SMS_DestinationAddress digits in the SMDPP message before lookup in the number portability database is performed.

Range: **intl, nai, nat, unknown**

intl— Number is treated as INTL (1) for number conditioning.

nai— The NAI from the SMS_DestinationAddress parameter in the SMDPP message is used to perform number conditioning

nat— Number is treated as NATL (0) for number conditioning.

unknown— Number is treated as UNKNOWN (2) for number conditioning.

A value of **nai** must be specified before the **intl, natl, nai1, nai2, nai3,** and **unkn** parameters in the **chg-npp-serv** command can be changed to non-default values for the MOSMSICDPN service.

Default: No change to the current value

System

Default: **intl**

:mosmstype= (optional)

MO-based SMS type. This parameter specifies the value of the entity type that indicates that a successful lookup occurred in the number portability database.

Range: **sp, rn, sprn, all**

sp— signalling point

rn— routing number

sprn— Lookup is successful if the value of the entity type is **sp** or **rn**.

all— Lookup is successful if the value of the entity type is **sp** or **rn**, or if no entity type is found.

Default: No change to the current value

System

Default: **sprn**

:mtsmsackn= (optional)

MT-Based SMS acknowledgement. This parameter specifies the message that is generated in response to a successful number portability database lookup for an SMSREQ message from a Home SMSC.

Range: **ack, nack**

ack— SMSREQ_ACK message

nack— SMSREQ_NACK (Return Error) message

Default: **No change to current value.**

System

Default: **ack**

:mtsmschksrc= (optional)

MT-Based SMS check source. This parameter specifies whether the SCCP CgPA GTA of a SMSREQ message is validated to determine whether the source of the message is a Home SMSC.

Range: **yes, no**

yes— The SCCP CgPA GTA of an SMSREQ message is validated.

no— The SCCP CgPA GTA of an SMSREQ message is not validated.

If the **mtsmschksrc=yes** parameter is specified, and if the incoming SMSREQ message has SCCP CgPA GTA, then the SCCP CgPA GTA must be found in the Home SMSC list for the source of the message to be considered a Home SMSC. If the message is not found in the Home SMSC list, then the MT-Based IS41 SMS NP feature does not process the message.

If the **mtsmschksrc=no** parameter is specified, or if SCCP CgPA GTA does not exist in the incoming message, then the source of the message is considered to be a Home SMSC, and the MT-Based IS41 SMS NP feature considers the message for processing.

Default: No change to current value

System

Default: **no**

:mtmsdigtype= (optional)

MT-Based SMS digit type. This parameter specifies the value that is used to encode the "Type of digits" field in the SMS_Address parameter of an SMSREQ ACK message.

Range: **0-255**

Default: No change to the current value

System

Default: **6**

:mtmsdltr= (optional)

MT-Based SMS delimiter. This parameter specifies whether to insert a delimiter string before or after the routing number (RN) when the RN is used in the **mtmsdnfmt** digits.

The delimiter string that is inserted is determined by the **mtmsdltrv** parameter.

Range: **no, prern, postrn**

no — A delimiter string is not inserted.

prern — A delimiter digit string is inserted before the RN.

postrn — A delimiter digit string is inserted after the RN.

Default: No change to the current value

System

Default: **no**

:mtmsdltrv= (optional)

MT-Based SMS delimiter value. This parameter specifies the delimiter digit string that is inserted before or after the RN when the RN is used in the **mtmsdnfmt** digits.

Range: 1-5 digits, **none**

Valid digits are **0-9, A-F, a-f**.

Default: No change to the current value

System

Default: **none**

:mtmsdnfmt= (optional)

MT-Based SMS DN format. This parameter specifies the required format of digits to be encoded in the "SMS_Address" parameter of the SMSREQ response.

Range: **rn, rndn, ccrndn, dn, srfimsi**

rn — routing number

rndn — routing number and the international dialed/directory number

ccrndn — country code, routing number, and national directory/dialed number

dn — directory or dialed number

srfimsi — IMSI is encoded as the "SRFIMSI" parameter from the number portability database.

Default: No change to the current value

System

Default: **rndn**

:mtmsesn= (optional)

MT-Based SMS electronic serial number. This parameter specifies whether to encode the ESN parameter while generating the SMSREQ response message.

Range: **no, yes**

no — The ESN parameter is not encoded.

yes — The ESN parameter is encoded.

Default: No change to the current value

System

Default: **no**

:mtsmsnakerr= (optional)

MT-Based SMS negative acknowledgement error. This parameter specifies the TCAP access denied reason to be included in the NACK response message that is generated for SMSREQ messages.

Range: **0-255**

Default: No change to the current value.

System

Default: **5**

:mtsmsparm= (optional)

MT-Based SMS parameter. This parameter specifies the format that is used to encode the "SMS_Address" parameter of an SMSREQ response message.

Range: **digit, pcssn**

digit — DIGIT format

pcssn — PCSSN format

Default: No change to the current value

System

Default: **digit**

:mtsmsssn= (optional)

MT-Based SMS subsystem number. This parameter specifies the SSN that is encoded in "SMS_Address" field, if the **mtsmsparm=pcssn** parameter is specified, and the SSN entry is not found in the entity.

Range: **2-255**

Default: No change to the current value

System

Default: **6**

:mtsmstype= (optional)

MT-Based SMS type. This parameter specifies the entity type that indicates a successful lookup occurred in the number portability database.

Range: **sp, rn, sprn, all, nonsp**

sp — signalling point

rn — routing number

sprn — **sp** or **rn**

all — **sp, rn,** or DN with no entity

nonsp — **rn** or DN with no entity

Default: No change to the current value

System

Default: **rn**

:spfill= (optional)

This parameter specifies whether the Numbering Plan Processor (NPP) can populate SP and RN entities for own network subscribers at the same time.

Range: **off, on**

off — Do not populate both RN and SP entities at the same time

on — Allow population of the RN and SP entities at the same time

Default: No change to the current value

System

Default: **off**

:sporttype= (optional)

Service Portability type. This parameter specifies whether Service Portability is performed for the associated feature.

NOTE: If Service Portability is performed, then the Service Portability prefix (RTDB 'GRN'entity id) is applied.

Range: gsm, is41, all

gsm— Apply Service Portability prefix for own-network GSM subscribers

is41— Apply Service Portability prefix for own-network IS41 subscribers

all— Apply Service Portability prefix for all own-network (IS41 and GSM) subscribers

none— Service Portability is not performed for the feature.

Default: No change to the current value

System

Default: none

Example

The following example sets the IS41 SMS options when MO SMS ASD or MO SMS GRN feature is enabled:

```
chg-is41smsopts:modaparam=da:mosmsnai=intl:mosmsaclen=3
```

The following example sets the IS41 SMS options when the MT-based IS41 SMS NP feature is enabled:

```
chg-is41smsopts:mtsmsdltr=no:mtsmsparm=digit
```

The following example sets the IS41 SMS options when the MT-based IS41 SMS NP feature is enabled:

```
chg-is41smsopts:mtsmsdltrv=9854:mtsmsackn=nack:mtsmsesn=no
```

The following example sets the IS41 SMS options when the MT-based IS41 SMS NP feature is enabled:

```
chg-is41smsopts:mtsmsssn=2:mtsmsnakerr=55:mtsmsdigtype=25
```

The following example sets the IS41 SMS options when the MT-based IS41 SMS NP feature is enabled:

```
chg-is41smsopts:mtsmschksrc=no
```

The following example sets the IS41 SMS options when the MO SMS B-Party Routing feature is enabled:

```
chg-is41smsopts:bpartygttsn=setint001:mosmsgttldig=mapbparty
```

The following example sets the IS41 SMS options when the MT-based IS41 SMS NP feature is enabled:

```
chg-is41smsopts:mtsmsdnfmt=dn:mtsmsstype=sp
```

The following example sets the IS41 SMS options when the MO-based IS41 SMS NP feature is enabled:

```
chg-
```

```
is41smsopts:mosmstype=sp:mosmsnai=intl:mosmsdigmat=exact:modaparam=da:mosmsaclen=3
```

The following example sets the IS41 SMS options when the MO SMS IS41-to-GSM Migration feature is enabled.

```
chg-
```

```
is41smsopts:mosmsdigmat=exact:moigmpfx=is412gsm:modaparam=da:mosmsnai=intl:mosmsaclen=3
```

The following example sets the Area Code Length, when MO-based IS41 SMS NP, MO SMS IS41-to-GSM Migr , MO SMS ASD or MO SMS GRN feature is enabled:

```
chg-is41smsopts:mosmsaclen=5
```

Dependencies

At least one parameter must be specified.

The **mtsmdltrv** parameter must be specified before a value of **prern** or **postrn** can be specified for the **mtsmdltr** parameter.

The value specified for the **bpartygttsn** parameter must match the name of an existing GTT Set.

The **mosmsgttdig=sccpcdpa** parameter must be specified before the **bpartygttsn=none** parameter can be specified.

The GTT set specified for the **bpartygttsn** parameter must have **settype=cdgta** (see the **ent-gttset** command).

If the **bpartygttsn=none** parameter is specified, then the **mosmsgttdig=mapbparty** parameter cannot be specified.

The MT-Based IS41 SMS NP feature must be enabled before the **mtsmdnfmt**, **mtsmstype**, **mtsmsparm**, **mtsmdltr**, **mtsmdltrv**, **mtsmsackn**, **mtsmsesn**, **mtsmsssn**, **mtsmsnakerr**, **mtsmsdigtype** or **mtsmschksrc** parameters can be specified.

The MO SMS IS41-to-GSM Migration feature must be enabled before the **moigmpfx** parameter can be specified.

The MO SMS B-Party Routing feature must be enabled before the **bpartygttsn** or **mosmsgttdig** parameter can be specified.

The MO-based IS41 SMS NP or MO SMS IS41-to-GSM Migration feature must be enabled before the **mosmsdigmat** parameter can be specified.

The MO-based IS41 SMS NP feature must be enabled before the **mosmstype**, **defrn**, and **spfill** parameters can be specified.

The MO-based IS41 SMS NP, MO SMS IS41-to-GSM Migration, MO SMS ASD, or MO SMS GRN feature must be enabled before the **modaparam**, **mosmsnai**, or **mosmsaclen** parameter can be specified. The **modaparam** parameter can also be specified if the MO SMS B-Party Routing feature is enabled.

The S-Port feature must be enabled before the **sporttype** parameter can be specified.

Output

```
chg-is41smsopts:mtsmsackn=ack
tekelecstp 08-05-11 13:11:27 EST EAGLE 39.0.0
CHG-IS41SMSOPTS: MASP A - COMPLTD
;
```

chg-isup-msg

Change ISUP Message

Use this command to enter or change specific parameters of an ISUP test message in the TESTMSG table. The TIF Test Tool processes ISUP test messages to verify the TIF and NPP provisioned configuration in the system.

Keyword: chg-isup-msg

Related Commands: rtrv-isup-msg, tst-msg

Command Class: Database Administration

Parameters

:msgn= (mandatory)

Test message number. This parameter specifies the ISUP test message number for which parameters are being changed in the TESTMSG table.

Range: 1-10

:active= (optional)

Active. This parameter sets the *Active* field of the specified ISUP test message.

Range: no, yes

no — Do not send the message to the network card for processing.

yes — Send the message to the network card for processing.

Default: no

:cdpndgts= (optional)

Called Party Number digits. This parameter specifies the value for the CdpN digits in the specified ISUP test message.

Range: 1-32 digits

1 - 32 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.

Default: No change to the current value

System

Default: 1234567890abcdef

:cdpnnai= (optional)

Called Party Number Nature of Address Indicator. This parameter specifies the value for the CdpN NAI in the specified ISUP test message.

Range: 0-127

Default: No change to the current value

System

Default: 4

:cgpncat= (optional)

Calling Party Number Category. This parameter specifies the value of the CgPN Category in the specified ISUP test message.

Range: 0-255

Default: 0

:cgpndgts= (optional)

Calling Party Number digits. This parameter specifies the value for the CgPN digits in the specified ISUP test message.

Range: 1-32 digits, none

1 - 32 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.

Default: No change to the current value

System

Default: 1234567890abcdef

:cgpnai= (optional)

Calling Party Number Nature of Address Indicator. This parameter specifies the value of the CgPN NAI in the specified ISUP test message.

Range: 0-127

Default: No change to the current value

System

Default: 4

:nmbits= (optional)

NM Bits. This parameter specifies the value of the NM bits in the specified ISUP test message. The NM bits are used to determine whether a number portability lookup has already been performed in the network.

Range: 0-3

0-1—Portability has not been performed.

2—The number is not ported.

3—The number is ported.

Default: 0

Example

```
chg-isup-
msg:msgn=1:active=yes:nmbits=1:cgpndgts=987654321:cdpndgts=923487
:cdpnnai=125
chg-isup-msg:msgn=6:cgpncat=200:cdpnnai=23
```

Dependencies

At least one of the optional parameters must be specified.

At least one TIF feature must be enabled before this command can be entered.

Output

```
chg-isup-msg:msgn=10:active=yes:nmbits=1
tekelecstp 08-07-24 10:37:20 EST EAGLE 39.2.0
CHG-ISUP-MSG: MASP A - COMPLTD
;
```

chg-l2t

Change Level 2 Timers

Use this command to change the values of the SS7 MTP level 2 timers. The timers are organized in 35 timer sets of 9 timer values each. The timer sets are grouped and system default values are initialized by specification (ANSI, ITU, High Speed for China, High Speed for Q.703 Annex A, and High Speed for Unchannelized T1).

NOTE: Each timer set is administered individually by this command. The ent-slk command is used to assign an SS7 signaling link to any of the timer sets. Each assigned link is associated with a timer set.

Keyword: chg-l2t

Related Commands: ent-slk, rtrv-l2t, rtrv-slk

Command Class: Database Administration

Parameters

:l2tset= (mandatory)

Level 2 timer set. This parameter specifies the Level 2 timer set identifier or timer set number. Up to 35 different timer sets can be defined. A signaling link can be assigned to any of the timer sets.

Range: 1-35

1-10 for ANSI links

11-20 for low-speed ITU links

21-25 for China high speed links

26-30 for Q.703 Annex A high speed links

31-35 for Unchannelized T1 high speed links

:nodata= (optional)

This parameter specifies a value for the NODATA timer.

The NODATA timer measures the amount of time, in milliseconds, that must pass with no transmissions on a link before the EAGLE 5 ISS interprets the condition as a link failure or terminal equipment failure and initiates changeover procedures.

Range: 100-500

Default: No change to the current value

System

Default: 100

:t1= (optional)

Timer 1—Aligned/ready

Range: 5000-350000

For ANSI timer sets 1–10—5000–20000 milliseconds

For ITU timer sets 11–20—40000–50000 milliseconds

For China timer sets 21–25—25000–350000 milliseconds

For Q.703 Annex A timer sets 26–30—25000–350000 milliseconds

For Unchannelized T1 timer sets 31–35—16000–151000 milliseconds

Default: No change to the current value

System

Default: For ANSI timer sets 1–10—13000 milliseconds

For ITU timer sets 11–20—40000 milliseconds

For China timer sets 21–25—150000 milliseconds

For Q.703 Annex A timer sets 26–30—300000 milliseconds

For Unchannelized T1 timer sets 31–35—151000 milliseconds

:t2= (optional)

Timer 2—Not aligned

Range: 5000-150000

For ANSI timer sets 1–10—5000–30000 milliseconds

For ITU timer sets 11–20—5000–150000 milliseconds

For China timer sets 21–25—5000–150000 milliseconds

For Q.703 Annex A timer sets 26–30—5000–150000 milliseconds

For Unchannelized T1 timer sets 31–35—5000–14000 milliseconds

Default: No change to the current value

System

Default: For ANSI timer sets 1–10—11500 milliseconds

For ITU timer sets 11–20—30000 milliseconds

For China timer sets 21–25—130000 milliseconds

For Q.703 Annex A timer sets 26–30—130000 milliseconds

For Unchannelized T1 timer sets 31–35—14000 milliseconds

:t3= (optional)

Timer 3—Aligned

Range: 1000-20000

For ANSI timer sets 1–10—5000–20000 milliseconds

For ITU timer sets 11–20—1000–2000 milliseconds

For China timer sets 21–25—1000–2000 milliseconds

For Q.703 Annex A timer sets 26–30—1000–2000 milliseconds

For Unchannelized T1 timer sets 31–35—5000–14000 milliseconds

Default: No change to the current value

System

Default: For ANSI timer sets 1–10—11500 milliseconds

For ITU timer sets 11–20—2000 milliseconds

For China timer sets 21–25—**1000** milliseconds
 For Q.703 Annex A timer sets 26–30—**1000** milliseconds
 For Unchannelized T1 timer sets 31–35—**14000** milliseconds

:t4epp= (optional)

Timer 4—Proving period Emergency

Range: **200-10000**

For ANSI timer sets 1–10—**200–1000** milliseconds
 For ITU timer sets 11–20—**400–600** milliseconds
 For China timer sets 21–25—**400–600** milliseconds
 For Q.703 Annex A timer sets 26–30—**400–600** milliseconds
 For Unchannelized T1 timer sets 31–35—**3000–10000** milliseconds

Default: No change to the current value

System

Default: For ANSI timer sets 1–10—**600** milliseconds
 For ITU timer sets 11–20—**500** milliseconds
 For China timer sets 21–25—**500** milliseconds
 For Q.703 Annex A timer sets 26–30—**500** milliseconds
 For Unchannelized T1 timer sets 31–35—**3000** milliseconds

:t4npp= (optional)

Timer 4— Proving period normal

Range: **500-70000**

For ANSI timer sets 1–10—**500–5000** milliseconds
 For ITU timer sets 11–20—**7500–9500** milliseconds
 For China timer sets 21–25—**3000–70000** milliseconds
 For Q.703 Annex A timer sets 26–30—**3000–70000** milliseconds
 For Unchannelized T1 timer sets 31–35—**3000–30000** milliseconds

Default: No change to the current value

System

Default: For ANSI timer sets 1–10—**2300** milliseconds
 For ITU timer sets 11–20—**8200** milliseconds
 For China timer sets 21–25—**30000** milliseconds
 For Q.703 Annex A timer sets 26–30—**30000** milliseconds
 For Unchannelized T1 timer sets 31–35—**30000** milliseconds

:t5= (optional)

Timer 5—Sending SIB

Range: **40-500**

For ANSI timer sets 1–10—**40–500** milliseconds
 For ITU timer sets 11–20—**80–120** milliseconds
 For China timer sets 21–25—**80–120** milliseconds
 For Q.703 Annex A timer sets 26–30—**80–120** milliseconds
 For Unchannelized T1 timer sets 31–35—**80–120** milliseconds

Default: No change to the current value

System

Default: For ANSI timer sets 1–10—**100** milliseconds
 For ITU timer sets 11–20—**100** milliseconds
 For China timer sets 21–25—**100** milliseconds
 For Q.703 Annex A timer sets 26–30—**100** milliseconds
 For Unchannelized T1 timer sets 31–35—**80** milliseconds

:t6= (optional)

Timer 6—Remote congestion

Range: **1000-10000**
 For ANSI timer sets 1–10—**1000–10000** milliseconds
 For ITU timer sets 11–20—**3000–6000** milliseconds
 For China timer sets 21–24—**3000–6000** milliseconds
 For Q.703 timer sets 26–30—**3000–6000** milliseconds
 For Unchannelized T1 sets 31–35—**3000–6000** milliseconds

Default: No change to the current value

System Default:
 For ANSI timer sets 1–10—**4000** milliseconds
 For ITU timer sets 11–20—**4000** milliseconds
 For China timer sets 21–25—**5000** milliseconds
 For Q.703 Annex A timer sets 26–30—**5000** milliseconds
 For Unchannelized T1 timer sets 31–35—**5000** milliseconds

:t7= (optional)

Timer 7—Excessive delay of acknowledgment

Range: **200-3000**
 For ANSI timer sets 1–10—**200–3000** milliseconds
 For ITU timer sets 11–20—**500–2000** milliseconds
 For China timer sets 21–25—**500–2000** milliseconds
 For Q.703 Annex A timer sets 26–30—**500–2000** milliseconds
 For Unchannelized T1 timer sets 31–35—**500–2000** milliseconds

Default: No change to the current value

System Default:
 For ANSI timer sets 1–10—**1500** milliseconds
 For ITU timer sets 11–20—**1500** milliseconds
 For China timer sets 21–25—**800** milliseconds
 For Q.703 Annex A timer sets 26–30—**800** milliseconds
 For Unchannelized T1 timer sets 31–35—**500** milliseconds

Example

```
chg-l2t:12tset=1:t1=5400
```

```
chg-l2t:12tset=21:t4epp=600:t5=90:t6=3500:t7=1900
```

```
chg-l2t:12tset=1:nodata=200
```

Dependencies

At least one optional parameter must be specified.

The value specified for the timer must be within the range for that domain.

Notes

ANSI timer defaults are within the Telcordia recommended ranges.

ITU timer defaults are within ITU Q.703 white book recommended ranges.

If the value specified for the **nodata** parameter is greater than 200 milliseconds, then the following message appears:

CAUTION: WARNING: If NODATA timer value is greater than 200ms, links could go into congestion before link failure is declared

Output

```

chg-l2t:l2tset=21:t4epp=600:t5=90:t6=3500:t7=1900
  rlgncxa03w 05-02-07 11:11:28 EST EAGLE5 34.0.0
  CHG-L2T: MASP A - COMPLTD
;

chg-l2t:l2tset=1:nodata=200
  tekelecstp 08-05-02 16:36:09 EST EAGLE 39.0.0
  CHG-L2T: MASP A - COMPLTD

```

chg-l3t**Change Level 3 Timers**

Use this command to change the SS7 MTP level 3 timers. The SS7 MTP level 3 timers are organized in a timer set of 21 values each. Only one timer set is administered by this command. Each linkset is associated with the SS7 MTP level 3 Timer set. The linkset and timer set association is assigned with the link administration commands.

Keyword: chg-l3t

Related Commands: chg-l2t, rtrv-l2t, rtrv-l3t

Command Class: Database Administration

Parameters

NOTE: Timer values are entered in milliseconds; however, the rtrv-l3t command displays output in seconds.

:l3tset= (mandatory)

Timer set table. Only one timer set table exists. All SS7 signaling links use the SS7 MTP level 3 timer set table.

Range: 1

:it18= (optional)

For ITU networks.

Timer 18—Timer within a signaling point whose MTP restarts to supervise the receipt of routing information and the activation of the link and link set; in milliseconds.

Range: 19000-50000

Default: No change to the current value.

System

Default: 50000

:it19= (optional)

For ITU networks.

Timer 19—Supervision timer during MTP restart to avoid ping-pong of TFP, TFR1, and TRA messages; in milliseconds.

Range: 67000-69000

Default: No change to the current value

System

Default: 67000

:it20= (optional)

For ITU networks.

Timer 20—Overall MTP restart timer at the signaling point whose MTP restarts; in milliseconds.

Range: 59000-61000

Default: No change to the current value.

System
Default: 59000

:it21= (optional)

For ITU networks.

Timer 21—Overall MTP restart timer at a signaling point adjacent to one whose MTP restarts; in milliseconds.

Range: 63000-65000
Default: No change to the current value.
System
Default: 63000

:it22= (optional)

For ITU networks.

Timer 22—Waiting to repeat local inhibit test; in milliseconds.

Range: 180000-360000
Default: No change to the current value
System
Default: 90000

:it23= (optional)

For ITU networks.

Timer 23—Waiting to repeat remote inhibit test; in milliseconds.

Range: 180000-360000
Default: No change to the current value
System
Default: 90000

:t1= (optional)

For ANSI or ITU networks.

Timer 1—Changeover delay in milliseconds. Also used as isolation timer for ITU MTP Restart.

Range: 100-2000
Default: No change to the current value
System
Default: 800

:t10= (optional)

For ANSI or ITU networks.

Timer 10—Wait to repeat signaling route set test (SRST) message; in milliseconds.

Range: 20000-90000
Default: No change to the current value
System
Default: 30000

:t11= (optional)

For ANSI or ITU networks.

Timer 11—Transfer restricted; in milliseconds.

Range: 1000-90000
Default: No change to the current value
System
Default: 30000

:t12= (optional)

For ANSI or ITU networks.

Timer 12—Wait for uninhibit acknowledgment; in milliseconds.

Range: 100-2000**Default:** No change to the current value**System****Default:** 800**:t13=** (optional)

For ANSI or ITU networks.

Timer 13—Wait for force uninhibit; in milliseconds.

Range: 100-2000**Default:** No change to the current value.**System****Default:** 800**:t14=** (optional)

For ANSI or ITU networks.

Timer 14—Wait for inhibit acknowledgment; in milliseconds.

Range: 200-4000**Default:** No change to the current value**System****Default:** 2000**:t15=** (optional)

For ANSI or ITU networks.

Timer 15—Wait for repeat route set congestion test (RSCT); in milliseconds.

Range: 200-4000**Default:** No change to the current value**System****Default:** 3000**:t16=** (optional)

For ANSI or ITU networks.

Timer 16—Wait for route set congestion test (RSCT) update; in milliseconds.

Range: 200-3000**Default:** No change to the current value**System****Default:** 1400**:t17=** (optional)

For ANSI or ITU networks.

Timer 17—Delay to avoid oscillation of initial alignment failure; in milliseconds.

Range: 500-2000**Default:** No change to the current value**System****Default:** 800**:t18=** (optional)

For ANSI networks.

Timer 18—Repeat transfer restricted (TFR) once by response method; in milliseconds.

Range: 2000-20000
Default: No change to the current value
System
Default: 10000

:t19= (optional)

For ANSI networks.

Timer 19—Failed link craft referral timer; in milliseconds.

Range: 30000-600000
Default: No change to the current value.
System
Default: 480000

:t2= (optional)

For ANSI or ITU networks.

Timer 2—Wait for changeover acknowledge (COA); in milliseconds.

Range: 100-3000
Default: No change to the current value
System
Default: 1400

:t20= (optional)

For ANSI networks.

Timer 20—Repeat local inhibit test; in milliseconds.

Range: 90000-120000
Default: No change to the current value
System
Default: 90000

:t21= (optional)

For ANSI networks.

Timer 21—Repeat remote inhibit test; in milliseconds.

Range: 90000-120000
Default: No change to the current value
System
Default: 90000

:t22= (optional)

For ANSI networks.

Timer 22—Timer at restarting STP, waiting for signaling links to become available; in milliseconds.

Range: 10000-60000
Default: No change to the current value.
System
Default: 10000

:t23= (optional)

For ANSI networks.

Timer 23—Timer at restarting STP, started after T22, waiting to receive all TRA messages; in milliseconds.

Range: 9000-100000
Default: No change to the current value.
System
Default: 10000

:t24= (optional)

For ANSI networks.

Timer 24—Timer at restarting STP with transfer function, started after T23, waiting to broadcast all TRA messages; in milliseconds.

Range: 9000-60000
Default: No change to the current value.
System
Default: 10000

:t25= (optional)

For ANSI networks.

Timer 25—Timer at adjacent STP and restarting STP, waiting for TRA message; may be started at level 2; in milliseconds.

Range: 30000-35000
Default: No change to the current value
System
Default: 30000

:t26= (optional)

For ANSI networks.

Timer 26—Timer at restarting STP, waiting to repeat TRW message; in milliseconds.

Range: 12000-15000
Default: No change to the current value.
System
Default: 12000

:t28= (optional)

For ANSI networks.

Timer 28—Timer at STP adjacent to restarting STP, waiting for TRW message; in milliseconds.

Range: 3000-35000
Default: No change to the current value
System
Default: 3000

:t29= (optional)

For ANSI networks.

Timer 29—Timer started when a TRA is sent in response to an unexpected TRA or TRW; also, started when traffic resumed without receipt of TRA; in milliseconds.

Range: 60000-65000
Default: No change to the current value
System
Default: 60000

:t3= (optional)

For ANSI or ITU networks.

Timer 3—Time controlled diversion on changeback; in milliseconds.

Range: 100-2000
Default: No change to the current value
System
Default: 800

:t30= (optional)

For ANSI networks.

Timer 30—Timer to limit sending of TFPs/TFRs in response to an unexpected TRA or TRW; in milliseconds.

Range: 30000-35000

Default: No change to the current value

System

Default: 30000

:t31= (optional)

For ANSI networks.

Timer 31—False link congestion detection; in milliseconds.

Range: 10000-120000

Default: No change to the current value.

System

Default: 60000

:t32= (optional)

For ANSI networks.

Timer 32—Link oscillation timer – Procedure A; in milliseconds.

Range: 60000-120000

Default: No change to the current value.

System

Default: 60000

:t4= (optional)

For ANSI or ITU networks.

Timer 4—Wait for changeback acknowledge (CBA) #1; in milliseconds.

Range: 100-2000

Default: No change to the current value

System

Default: 800

:t5= (optional)

For ANSI or ITU networks.

Timer 5—Wait for changeback acknowledge (CBA) #2; in milliseconds.

Range: 100-2000

Default: No change to the current value

System

Default: 800

:t6= (optional)

For ANSI or ITU networks.

Timer 6—Controlled reroute; in milliseconds.

Range: 100-2000

Default: No change to the current value

System

Default: 800

:t7= (optional)

For ANSI or ITU networks.

Timer 7—Signaling data link connection (SDLC) acknowledgment; in milliseconds.

Range: 100-3000
Default: No change to the current value.
System
Default: 1000

:t8= (optional)

For ANSI or ITU networks.

Timer 8—Transfer prohibited (TFP) inhibit; in milliseconds.

Range: 500-2000
Default: No change to the current value.
System
Default: 800

Example

```
chg-13t:13tset=1:t1=800
chg-13t:13tset=1:t5=800:t6=800:t32=70000
```

Dependencies

The minimum parameter requirement is the table number and at least one timer specified.

Do not specify T20 and IT22 pairs of timers together because one value overrides the other.

Do not specify T21 and IT23 pairs of timers together because one value overrides the other.

Notes

The command line allows 157 characters. Some SS7 MTP level 3 timer changes may exceed this limit. Multiple entries of this command may be required in such cases.

Timer 9 is not currently supported in the SS7 protocol, and has been omitted from this manual. The command will support this timer when it has been defined in the protocol.

The default values are within the Telcordia recommended ranges.

Output

```
chg-13t:13tset=1:t1=800

rlghncxa03w 04-01-07 08:40:50 EST EAGLE 31.3.0
CHG-L3T: MASP A - COMPLTD
;
```

chg-lbp

Change Loopback Point's Attribute Values

Use this command to change a far-end loopback point's attribute values maintained in the link fault sectionalization table.

Keyword: chg-lbp

Related Commands: act-lbp, dact-lbp, dlt-lbp, ent-lbp, rtrv-lbp

Command Class: Database Administration

Parameters

:lbp= (mandatory)

Loopback point ID. This parameter identifies a far-end loopback point that lies along an SS7 signaling link path between the STP and the target device (up to *and including* the target device).

Range: 1-32

:link= (mandatory)

SS7 signaling links. The SS7 signaling link to be tested.

Synonym: port

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling links.

:loc= (mandatory)

Card location. The unique identifier of a specific application subsystem located in the STP.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:cli= (optional)

Common Language Location Identifier (CLLI) code. This parameter specifies the CILLI or other mnemonic identifier used to refer to the given loopback point.

Range: ayyyyyyyyyy

1 alphabetic character followed by up to 23 alphanumeric characters

Default: No change to the cli value

:lfst= (optional)

Link fault sectionalization test. The type of link fault sectionalization loopback test to be performed.

Range: llt, nlt

llt—latching loopback test

nlt—nonlatching loopback test

:rep= (optional)

Repetition count. The number of link elements of the same type (not including the target device) that lie between the STP and the link element to be tested.

Range: 0-31

Default: No change unless:

0—The link element to be looped back for testing is NEI (**rle=nei** is specified)

0—The type of link fault sectionalization test is NLT (**lfst=nlt** is specified)

0—The type of link fault sectionalization test is NLT (**lfst=nlt** is specified)

0—The new remote link element is the first loopback point of the link to be tested

1-30—Next sequential number for subsequent loopback points of the link to be tested

:rle= (optional)

Remote link element. The link element to be looped back for testing.

Range: ds0, ocu, csu, dsu, nei

Default: No change to the rle value

Example

```
chg-lbp:loc=1101:link=a:lbp=1:rle=ds0:lfst=llt
```

Dependencies

The Link Fault Sectionalization (LFS) feature must be on before using this command.

At least one optional parameter must be specified.

The card location specified in the **loc** parameter cannot be reserved by the system.

The card location (**loc** parameter) must identify a provisioned **limds0**, **limt1**, or **limch** (associated to a **limt1**) card configured with either an **ss7ansi** or **ccs7itu** application.

The CLLI cannot be a reserved word.

The **rep** parameter value that is specified for this loopback point (LBP) must be greater than the **rep** parameter value of any previously defined LBP and *less* than the **rep** parameter value of any subsequently defined LBP.

The **rep** parameter must be specified if the default value is a duplicate of the **rep** parameter value of any previously defined loopback point.

The LBP must have been previously defined.

The **rep** parameter can be specified only if the **lfst=llt** parameter is specified.

If the **rle=nei** parameter is specified, the **rep=0** parameter must be specified.

The **rle=ds0** or the **rle=nei** parameter cannot be specified if the **lfst=nl** parameter is specified. The DS0 and Network Element Interface (NEI) link elements do not support non-latching loopbacks.

For each SS7 signaling link, you can define only one loopback point with **rle=nei** specified; and that loopback point must be the terminating SS7 signaling link component.

For each SS7 signaling link, the loopback point with **rle=nei** specified must be the terminating SS7 signaling link component.

The card location specified in the **loc** parameter must be equipped.

Notes

None

Output

```
chg-lbp:loc=1101:port=a:lbp=1:rle=ds0:lfst=llt
```

```
rlghncxa03w 05-01-17 15:35:05 EST EAGLE5 33.0.0
CHG-LBP: MASP A - COMPLTD
```

```
;
```

chg-lnp-serv

Change LNP Service

Use this command to change an existing LNP service.

Keyword: **chg-lnp-serv**

Related Commands: **dlt-lnp-serv**, **ent-lnp-serv**, **rtrv-lnp-serv**

Command Class: Database Administration

Parameters

NOTE: All alias translation types must be removed before the service can be moved to another translation type.

:ndftact= (optional)

New default action associated with an LNP TT Service entry.

Range: *ayyyyyyy*

1 leading alphabetic character followed by up to 8 alphanumeric characters

The **ndftact** parameter must have one of the following values:

- a GTT Action ID that already exists in the GTT Action table with an associated action of **disc/udts/tcaperr**
- **fallback**—Fallback to the relay data for MSUs relayed by LNP using relay data from the LNP database provided by the LNP Message Relay service. For an LNP Query message, the MSU is sent to the LNP local subsystem.

- **falltogtt**—Fallback to GTT. The GTT selector search is performed again, using **gttselid=none**.
 - Default:** No change to the current value
- :ndv=** (optional)
New digits valid.
 - Range:** **sccp, tcap**
 - Default:** No change to the current value
- :ngttselid=** (optional)
New GTT Selector ID.
 - Range:** **0-65534 none**
none—deletes the current value of the **gttselid** field
 - Default:** No change to the current value
- :nserv=** (optional)
New reserved service type name.
 - Range:** **ain, in, pcs, wnp, class, lidb, cnam, isvm, lnpqs, wmsc, udf1, udf2, udf3, udf4, lrnqt**
 - Default:** No change to the current value
- :ntt=** (optional)
New translation type.
 - Range:** **0-255**
 - Default:** No change to the current value
- :nttn=** (optional)
User defined TT name.
 - Range:** **ayyyyyyy, none**
1 alphabetic character followed by up to 7 alphanumeric characters
none—defaults the name to the reserved service type name
 - Default:** If **none** is specified, the default value is the reserved service type name (**serv** parameter). If **none** is not specified, no change to current value.
- :off=** (optional)
Disables or turns off the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned off. Up to 10 feature options can be specified in the list.
 - Range:** **gtrrqd**
- :on=** (optional)
Enables or turns on the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned on. Up to 10 feature options can be specified in the list.
 - Range:** **gtrrqd**
- :serv=** (optional)
Reserved service type name.
 - Range:** **ain, in, pcs, wnp, class, lidb, cnam, isvm, lnpqs, wmsc, udf1, udf2, udf3, udf4, lrnqt**
 - Default:** No change to the current value
- :tt=** (optional)
Translation type.
 - Range:** **0-255**

Default: No change to the current value

Example

```
chg-lnp-serv:tt=10:ndfltact=fallback:on=gtrqd:ngttselid=none
chg-lnp-serv:serv=lidb:ntt=22:ndv=tcap:nttn=mrldb
chg-lnp-serv:tt=239:nserv=lrnqt
```

Dependencies

The same value cannot be specified for the **on** and **off** parameters.

The **ndfltact=none** parameter cannot be specified.

The EGTT feature must be turned on before the **ngttselid**, **ndfltact**, or **on/off=gtrqd** parameter can be specified.

If a GTT Action ID is specified as the value for the **ndfltact** parameter, then the Action ID must already exist in the GTT Action table.

If a GTT Action ID is specified as a value for the **ndfltact** parameter, then the GTT Action ID must have an associated action of **disc**, **udts**, or **tcaperr**.

The LNP feature must be turned on before this command can be entered.

The LNP SMS feature must be turned on before the **nserv=wsmc** parameter can be specified.

The PCS 1900 LNP (PLNP) feature must be turned on before the **nserv=pcs** parameter can be specified.

The WNP feature must be turned on before the **nserv=wnp** parameter can be specified.

The value of the **ntt** parameter cannot already exist in the LNP database.

The value of the **nttn** parameter cannot already exist in the LNP database.

The value of the **serv** parameter must already exist in the LNP database.

The **serv** or **tt** parameter and one other optional parameter must be specified.

The same value cannot be specified for the **ndv** and **dv** parameters.

An LNP alias cannot be specified as the value for the **ntt** parameter.

All LNP aliases for the existing service must be removed from the LNP database before the **nserv** or **ntt** parameter can be specified.

A reserved service type name can be specified as a value for the **nttn** parameter only if the name matches the existing service (the value specified for the **serv** parameter).

If a value of **wsmc**, **udf1**, **udf2**, **udf3**, or **udf4** is specified for the **serv** parameter, then the **ndv=sccp** parameter must be specified.

If a value of **lnpqs**, **ain**, **in**, **pcs**, **wnp**, or **lrnqt** is specified for the **serv** parameter, then the **ndv=tcap** parameter must be specified.

The LRNQT feature must be turned on before the **(n)serv=lrnqt** parameter can be specified.

The value specified for the **nserv** parameter cannot already exist in the LNP database.

If the value specified for the **tt** parameter is an alias, then the **ntt**, **nserv**, **nttn**, and **ndv** parameters cannot be specified.

If the value specified for the **(n)serv** parameter is already associated with the **class**, **lidb**, **cnam**, **isvm**, **wsmc**, **udf1**, **udf2**, **udf3**, or **udf4** service, then a value of **lnpqs**, **lrnqt**, **ain**, **in**, **wnp**, or **pcs** cannot be specified for the **(n)serv** parameter.

The **ndfltact**, **ngttselid**, and **on/off=gtrqd** parameters cannot be specified with the **udf1**, **udf2**, **udf3**, and **udf4** LNP Services.

Notes*on/off options*

gttrqd—GTT required. Specifies whether GTT is performed after the successful completion of an LNP Message Relay service and before initiation of an LNP Query service. This option has a default of OFF.

Output

```
chg-lnp-serv: tt=3: on=gttrqd: ngttselid=10: ndfl tact=fall togtt
rlghncxa03w 10-11-08 08:50:12 EST EAGLE 43.0.0
CHG-LNP-SERV: MASP A - COMPLTD
;
```

chg-lnpopts**Change LNP System Options**

Use this command to enter LNP-specific system options in the database. This command updates the LNPOPTS table.

Keyword: chg-lnpopts

Related Commands: rtrv-lnpopts

Command Class: Database Administration

Parameters

NOTE: As of Release 43.0, the dra, lrndgts, naiv, and tndgts parameters are obsolete for this command.

:admhipri= (optional)

Give LNP database administration the highest administrative priority in the system.

Range: yes, no

Default: No change to the current value

:amactype= (optional)

AMA call type.

Range: 3 digits

Default: No change to the current value

:amafeatid= (optional)

AMA feature ID.

Range: 3 digits

Default: No change to the current value

:amaslpid= (optional)

AMA slip ID.

Range: 9 digits

Default: No change to the current value

:ccp= (optional)

Copy charge parameters. When this parameter is enabled (**ccp=yes**), the EAGLE 5 ISS copies the Charge Number and Charge Party Station type from an LNP AIN query (if present) to the LNP AIN Response message.

Range: yes, no

Default: No change to the current value

:cic= (optional)

Carrier identification code.

Range: 3-4 digits

Default: No change to the current value

:frcsmpx= (optional)

Allow simplex database updates.

Range: **yes, no**

Default: No change to the current value

:gtwystp= (optional)

Indicates that the LNP system is also configured as a Gateway STP.

Range: **yes, no**

Default: No change to the current value

:incslp= (optional)

Include AMA slip ID in the response.

Range: **yes, no**

Default: No change to the current value

:jipdigits= (optional)

Jurisdictional Information Parameter value.

Range: 6 digits

Default: No change to the current value

:jipprv= (optional)

Determines whether a Jurisdictional Information Parameter value is to be added to the IAM.

Range: **yes, no**

Default: No change to the current value

:servport= (optional)

Service portability.

Range: **yes, no**

yes — allows splitting services between TN and LRN override records. This setting allows the LNP user to update LRN overrides for message relay services that are to be supported in the network. The TN gateway point code (NPAC subscription data) is used for message relay services the CLEC wants to provide.

no — If no LRN override services are provisioned, then the TN's gateway point codes (NPAC subscription data) are used to route queries out of the network. If one or more LRN override services are provisioned, the TN is considered to be ported into the network. In this case, if an LRN override service is requested and the LRN has other services administered, but the requested service is not provisioned, then a UDTS response for the service is provided.

Default: No change to the current value

:sp= (optional)

Service provider ID.

Range: *xyyy*

4 alphanumeric characters

Default: No change to the current value

:wqredrct= (optional)

Wireless queries directed to default GTT.

Range: **on, off**

on — allows GTT functionality to treat any wireless LNP (WNP and PCS) queries that require GT as a normal GTT

off — routes all wireless LNP queries (WNP and PCS) that require GT directly to the local subsystem

Default: No change to the current value

- :wsmc10dig=** (optional)
 SCCP GTA digit length indicator for 10 or 11 digits.
Range: **yes, no**
 yes— The system verifies that either 10 or 11 digits are present in the CDPA GTA. If 11 digits are present, the first digit is stripped to derive 10 digits for LNP SMS translation. If 10 digits are present, all 10 digits are used for LNP SMS translation.
 no— The system verifies that 11 digits (plus a padded 0 digit) are present in the CDPA GTA. If 11 digits are present, the system strips the first digit and considers only 10 digits for LNP SMS translation.
Default: No change to the current value
- :dra=** (obsolete)
 Destination routing address content.
Range: **lrntn, lrn**
Default: No change to the current value
- :lrndgts=** (obsolete)
 LRN digits.
Range: **1-10**
Default: No change to the current value
- :naiv=** (obsolete)
 Nature of address indicator value.
Range: **0-127**
Default: No change to the current value
- :tndgts=** (obsolete)
 TN digits.
Range: **1-10**
Default: No change to the current value

Example

```

chg-lnpopts:amaslpid=123456789
chg-lnpopts:amactype=003
chg-lnpopts:amafeatid=010
chg-lnpopts:incslp=yes
chg-lnpopts:cic=1369
chg-lnpopts:sp=1234
chg-lnpopts:jipdigits=919460
chg-lnpopts:jipprv=yes
chg-lnpopts:frcsmplx=yes
chg-lnpopts:admhipri=yes
chg-lnpopts:gtwystp=yes
chg-lnpopts:ccp=yes
chg-lnpopts:servport=yes
chg-lnpopts:wqredrct=off
chg-lnpopts:wsmc10dig=yes

```

Dependencies

At least one optional parameter must be specified.

The LNP and Triggerless LNP (TLNP) features must be turned on before this command can be entered.

The Triggerless LNP feature must be turned on before the **jipprv** and the **jipdigits** parameters can be specified.

The LNP SMS feature must be turned on before the **wsmc10dig** parameter can be specified.

The LNP feature must be turned on before this command can be entered.

The WNP or PCS feature must be turned on before the **wqredrct** parameter can be specified.

Notes

The **frcsimplex** parameter is used to force the system in a forced simplex mode. In this mode, simplex updates are accepted by the active OAM if the standby OAM is in one of the following states: incoherent, diff level, or unstable.

If the **admhipri** parameter is set to **yes**, LNP database administration can starve out normal STP updates during LNP administration of 2 TNs per second. If the parameter is set to **no**, then STP and LNP updates receive the same priority. Depending on the system activity level, the performance of LNP updates may be reduced.

If the **gtwystp** parameter is set to **yes**, the LNP system is also configured as a gateway STP. The NPAC sends down capability point codes without routes. In this configuration, the system does not output a warning (UIM 1176) about capability point codes or true point codes without routes.

Output

```
chg-lnpopts: amaslpid=123456789
```

```
rlghncxa03w 04-01-07 00:57:31 EST EAGLE 31.3.0
CHG-LNPOPTS: MASP A - COMPLTD
```

```
;
```

chg-loopset

Change Loop Set command

Use this command to change the loopset data in the database. This command updates the Loopset Table. A single instance of the **chg-loopset** command can be used to append up to 6 point codes to the loopset (a loopset can contain a total of 12 point codes), replace all data in the loopset, or change one or two point codes in the loopset.

Keyword: **chg-loopset**

Related Commands: **dlt-loopset**, **ent-loopset**, **rtrv-loopset**

Command Class: Database Administration

Parameters

:name= (mandatory)

Loopset name. This parameter specifies an entry in the Loopset table.

The **name=none** parameter cannot be specified.

Range: *ayyyyyyy*

1 alphabetic and up to 7 alphanumeric characters.

:apcl= (optional)

ANSI appending point code list with subfields *network indicator-network cluster-network cluster member (ninc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*). This parameter allows up to 6 comma-delimited entries in the point code list.

Synonym: **apcla**

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:apcli= (optional)

ITU international appending point code list with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*). This parameter allows up to 6 comma delimited entries in the point code list.

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:apcln= (optional)

ITU national appending point code list in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*). This parameter allows up to 6 comma-delimited entries in the point code list.

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:apcln24= (optional)

24-bit ITU national appending point code list with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). This parameter allows up to 6 comma-delimited entries in the point code list.

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:force= (optional)

The **force=yes** parameter must be specified to modify a loopset that is being used by GTT.

Range: yes

:mode= (optional)

Mode of operation. This parameter specifies whether the message is discarded when an SCCP loop is detected.

Range: **notify, discard**

notify — Generates a UIM without discarding the message.

discard — Generates a UIM and discards the message.

:npc1= (optional)

ANSI new point code 1 with subfields *network indicator-network cluster-network cluster member (ninc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **npc1a**

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.

The point code **000-000-000** is not a valid point code.

:npc1i= (optional)

ITU international new point code 1 with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:npc1n= (optional)

ITU national new point code 1 in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:npc1n24= (optional)

24-bit ITU national new point code 1 with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **p-, 000-255**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—p-
msa—000-255
ssa—000-255
sp—000-255

:npc2= (optional)

ANSI new point code 2 with subfields *network indicator-network cluster-network cluster member (ninc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **npc2a**

Range: **p-, 000-255**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—p-
 When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.
 When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.
 When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.
 The point code **000-000-000** is not a valid point code.

:npc2i= (optional)

ITU international new point code 2 with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—s-, p-, ps-
zone—0-7
area—000-255
id—0-7
 The point code **0-000-0** is not a valid point code.

:npc2n= (optional)

ITU national new point code 2 in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—s-, p-, ps-
nnnnn—0-16383
gc—aa-zz
m1-m2-m3-m4—0-14 for each member; values must sum to 14

:npc2n24= (optional)

24-bit ITU national new point code 2 with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:pc1= (optional)

ANSI point code 1 with subfields *network indicator-network cluster-network cluster member (ninc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: pc1a**Range: p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.

The point code **000-000-000** is not a valid point code.

:pc1i= (optional)

ITU international point code 1 with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pc1n= (optional)

ITU national point code 1 in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfcmi** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pc1n24= (optional)

24-bit ITU national point code 1 with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **p-, 000-255**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—**p-**
msa—**000-255**
ssa—**000-255**
sp—**000-255**

:pc2= (optional)

ANSI point code 2 with subfields *network indicator-network cluster-network cluster member (ninc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **pc2a**

Range: **p-, 000-255**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—**p-**
 When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.
 When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.
 When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.
 The point code **000-000-000** is not a valid point code.

:pc2i= (optional)

ITU international point code 2 with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—**s-, p-, ps-**
zone—**0-7**
area—**000-255**
id—**0-7**
 The point code **0-000-0** is not a valid point code.

:pc2n= (optional)

ITU national point code 2 in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—**s-, p-, ps-**
nnnnn—**0-16383**
gc—**aa-zz**
m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pc2n24= (optional)

24-bit ITU national point code 2 with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **p-, 000-255**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—**p-**
msa—**000-255**
ssa—**000-255**
sp—**000-255**

:rpcl= (optional)

ANSI replacing point code list with subfields *network indicator-network cluster-network cluster member (ninc-ncm)*. The prefix subfield indicates a private point code (*prefix-ni-nc-ncm*). This parameter allows up to 6 comma-delimited entries in the point code list.

Synonym: **rpcla**

Range: **p-, 000-255**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—**p-**
 When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.
 When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.
 When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.
 The point code **000-000-000** is not a valid point code.

:rpcli= (optional)

ITU international replacing point code list with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*). This parameter allows up to 6 comma-delimited entries in the point code list.

Range: **s-, p-, ps-, 0-255**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—**s-, p-, ps-**
zone—**0-7**
area—**000-255**
id—**0-7**
 The point code **0-000-0** is not a valid point code.

:rpcln= (optional)

ITU national replacing point code list in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*). This parameter allows up to 6 comma-delimited entries in the point code list.

Range: **s-, p-, ps-, 0-16383, aa-zz**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—**s-, p-, ps-**
nnnnn—**0-16383**
gc—**aa-zz**
m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:rpcln24= (optional)

24-bit ITU national replacing point code list with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. This parameter allows up to 6 comma-delimited entries in the point code list.

Range: **p-**, **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Example

This example sets the mode to discard and appends the listed point codes to the loopset rtp1 if the set is not being used by GTT.

```
chg-loopset:name=rtp1:mode=discard:apcl=3-7-3,5-7-5,7-4-7,5-4-5
```

This example replaces the point codes in the set with the listed point codes for the loopset rtp1 if the set is not being used by GTT.

```
chg-loopset:name=rtp2:rpcl=3-2-3,5-7-8,7-8-7,3-5-3
```

This example sets the mode to discard in the loopset rtp2 if the set is not being used by GTT.

```
chg-loopset:name=rtp2:mode=discard
```

This example replaces pc1 with npc1 in the loopset rtp1 if the set is not being used by GTT.

```
chg-loopset:name=rtp1:pc1=3-3-3:npc1=3-3-9
```

This example replaces pc1 and pc2 with npc1 and npc2 in the loopset rtp2 if the set is not being used by GTT.

```
chg-loopset:name=rtp2:pc1=3-2-3:npc1=3-3-9:pc2=7-8-7:npc2=7-7-9
```

This example sets the mode to notify in the loopset rtp2 even if the set is being used by GTT.

```
chg-loopset:name=rtp2:mode=notify:force=yes
```

Dependencies

If the loopset is being used by GTT, and the **rpcl**, **pc1/pc2/npc1/npc2**, or **mode** parameter is specified, then the **force=yes** parameter must be specified.

If the **pc2** parameter is specified, then the **pc1** parameter must be specified.

If the **npc1** or **npc2** parameter is specified, then the corresponding **pc1** or **pc2** parameter must be specified.

The command requires at least one optional parameter.

The **rpcl** and **apcl** parameters cannot be specified together in the command.

If the **pc1** or **pc2** parameter is specified, then the **apcl** and **rpcl** parameters cannot be specified.

The value of the **name** parameter must already exist in the database.

The SCCP Loop Detection feature must be enabled before this command can be entered.

The GTT feature must be turned on before this command can be entered.

A maximum of 6 point codes can be added using this command with the **apcl** parameter. The Loopset entry can contain a maximum of 12 point codes.

The Loopset table can hold a maximum of 1,000 loopset entries, with each entry containing up to 12 point codes. Additional loopset entries and point codes cannot be added when the table is full.

The values for the **apcl** and **rpcl** parameters cannot consist of any invalid point codes. The valid point codes must be consecutively specified and separated by commas.

The **name=none** parameter cannot be specified.

At least one valid point code must be specified as a value for the **apcl** and **rpcl** parameters.

The values specified for the **apcl** and **rpcl** parameters must be unique.

If the **npc1/pc1** or **npc2/pc2** parameters are specified together, then the value of the **npc** parameter cannot equal the value of the **pc** parameter.

A valid point code must be specified for the **pc1**, **pc2**, **npc1** or **npc2** parameter.

Equal values cannot be specified for the **pc1** and **pc2** parameters.

Equal values cannot be specified for the **npc1** and **npc2** parameters.

When adding point codes using the **apcl** parameter, or changing individual point codes using the **pc1/npc1** or **pc2/npc2** parameters, the new point code type must match the point code type of the loopset where the point codes are being added or changed.

The value of the **apcl** parameter cannot already exist in the loopset.

The value of the **pc1** or **pc2** parameter must already exist in the loopset.

Output

The following example replaces the existing point codes with new point codes in the loopset **rtp2** when that set is not being used by GTT.

```
chg-loopset:name=rtp2:pc1=3-2-3:npc1=3-3-9:pc2=7-8-7:npc2=7-7-9
  rlgncxa03w 07-02-10 08:41:17 EST EAGLE Rel 35.6.0
  LOOPSET table is (12 of 1000) 1% full
  CHG-LOOPSET: MASP A - COMPLTD
;
```

chg-ls

Change Linkset

Use this command to change the attributes for a specified linkset in the system database. The new values overwrite the existing values. All parameters required for MTP distribution will be used whether they are explicitly specified or obtain from existing provisioning.

Keyword: chg-ls

Related Commands: chg-lsopts, chg-slt, dlt-ls, rtrv-ls

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:lsn= (mandatory)

Linkset name. Each linkset name must be unique in the system.

Range: *aaaaaaaa*

1 alphabetic character followed by up to 9 alphanumeric characters

:action= (optional)

This parameter adds or deletes the SAPC, mate IPGWx linkset name, or the value specified for the **rcontext** parameter.

Range: **add, delete**

Default: No change to the current value

System

Default: **add**

:adapter= (optional)

Adapter layer for links provisioned in a IPSP linkset.

Range: m3ua, m2pa

Default: No change to the current value

System

Default: m2pa

:apc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: apca

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.

The point code **000-000-000** is not a valid point code.

:apc/apca/apci/apcn/apcn24= (optional)

Adjacent point code.

:apci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:apcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:apcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-**, **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:apctype= (optional)

ITU-N Adjacent Point Code Type. This parameter specifies the format that will be used for changeover and changeover acknowledgement messages.

Range: **itun**, **itunchina**

itun — ITU National Adjacent Point Code type

itunchina — ITU National China Adjacent Point Code type

Default: **itun**

:asl8= (optional)

Adjacent SLS 8-bit indicator. This parameter specifies whether the adjacent node is sending MSUs with 8-bit SLSs.

Range: **yes**, **no**

Default: No change to the current value

:asnotif= (optional)

AS notification. This parameter specifies whether AS notifications are sent for an IPSG linkset.

Range: **yes**, **no**

If the **adapter=m2pa** parameter is specified, then the default value of the **asnotif** parameter is **no**.

If the **adapter=m3ua** parameter is specified, then the default value of the **asnotif** parameter is **yes**.

Default: **yes**

:bei= (optional)

Broadcast exception indicator. This parameter specifies whether TFP (transfer prohibited) messages are allowed to be broadcast on the linkset.

Range: **yes**, **no**

yes — TFPs are not broadcast.

no — TFPs are broadcast.

Default: No change to the current value

:cggmod= (optional)

Calling party GT modification indicator. This parameter specifies whether calling party global title modification is required for the specified linkset.

Range: **yes**, **no**

Default: No change to the current value

:cli= (optional)

Far-end Common Language Location Identifier (CLLI). This parameter specifies the CLLI assigned to the linkset.

Range: *ayyyyyyyyy*

1 alphabetic character followed by up to 10 alphanumeric characters

Default: No change to the current value

:gmscrn= (optional)

GSM MAP screening. This parameter specifies whether GSM MAP screening is allowed.

Range: on, off

Default: No change to the current value

:gttmode= (optional)

Global Title Translation Mode. This parameter specifies a GTT Mode hierarchy for each link set.

Range: cd, cg, acdcd, acdcg, acdcdcg, cgacdcd, cgcd, cdcg, fcd, fcg, fcgfd, fcdfcg, sysdflt

cd — CdPA GTT only

cg — CgPA GTT only

acdcd — Advanced CdPA GTT, CdPA GTT

acdcg — Advanced CdPA GTT, CgPA GTT, CdPA GTT

acdcdcg — Advanced CdPA GTT, CdPA GTT, CgPA GTT

cgacdcd — CgPA GTT, Advanced CdPA GTT, CdPA GTT

cgcd — CgPA GTT, CdPA GTT

cdcg — CdPA GTT, CgPA GTT

fcd — FLOBR CdPA only

fcg — FLOBR CgPA only

fcgfd — FLOBR CgPA, FLOBR CdPA

fcdfcg — FLOBR CdPA, FLOBR CgPA

sysdflt — System wide default value

Default: No change to current value.

:gwsa= (optional)

Gateway screening action. This parameter specifies whether gateway screening (GWS) is on or off for the specified linkset.

Range: on, off

Default: No change to the current value

:gwsd= (optional)

Gateway screening MSU discard. This parameter specifies whether the discarding of MSUs that bypass the gateway screening function due to load-shedding is on or off. This parameter is also used with the redirect function; MSUs that cannot be screened are discarded if **gwsd=on** is specified.

Range: on, off

Default: off

:gws= (optional)

Gateway screening messaging. This parameter specifies whether messages are generated for each message screened by gateway screening.

Range: on, off

Default: No change to the current value

:ipsg= (optional)

IP signaling gateway adjacent point code. This parameter specifies whether a linkset is entered for an IP SG card. The specified adjacent point code is an IPLIM or IP gateway adjacent point code.

Range: yes, no

Default: no

:iptps= (optional)

IPGWx Linkset TPS.

If the HIPR2 High Rate Mode feature is turned off, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 500,000. If the HIPR2 High Rate Mode feature

is turned on, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 750,000.

Range: **100-32000**
 The specified value must be divisible by 10.
Default: No change to the current value

:islsrsb= (optional)

Incoming rotated signaling link selection (SLS) bit. This parameter specifies the bit (**1–4**) for ITU and (**1–8**) for ANSI link sets to rotate as the new SLS LSB (Least Significant Bit) of the incoming linkset. The SLS is not modified in the outgoing message.

Table 5-25 shows how the rotation affect the four bits of the ITU SLS during linkset selection.

Table 5-26 shows how the rotation affect the four bits of the ANSI SLS during linkset selection.

This parameter is used for ITU or ANSI messages on a per-linkset basis.

Range: **1-8**
 ITU linkset—**1–4**
 ANSI linkset—**1–8**
 The **rsls8=yes** parameter must be specified (see the **chg-lsopts** command) before a value greater than **5** can be specified for the **islsrsb** parameter.
Default: No change to the current value
System
Default: **1**

:itutfr= (optional)

ITU TFR (Transfer Restricted) procedure indicator. This parameter specifies whether the TFR procedure is on or off on a per-linkset basis. This parameter is valid for ITU national linksets only.

Range: **on, off**
Default: No change to the current value

:l3tset= (optional)

Link timer set. This parameter is defined with the **chg-l3t** command.

Range: **1**
Default: No change to the current value

:lst= (optional)

Linkset type of the specified linkset. This parameter specifies whether the specified link is an access link, bridge link, cross link, diagonal link, or extended link, as defined in Telcordia GR-246-CORE, T1.111.5.

Range: **a, b, c, d, e**
 a— Access links
 b— Bridge links
 c— Cross links
 d— Diagonal links
 e— Extended links
Default: No change to the current value

:lsusealm= (optional)

IPTPS linkset alarm threshold percent. This parameter specifies the percent of the linkset TPS (**iptps**) at which an alarm is generated to indicate that the actual linkset TPS is approaching the configured **iptps** value for the linkset.

Range: **10-100**
Default: No change to the current value
System
Default: **100**

:matelsn= (optional)

Mate linkset name.

- Range:** *ayyyyyyyyy*
1 alphabetic character followed by up to 9 alphanumeric characters
- Default:** No change to the current value

:maxslktps= (optional)

Maximum per signaling link TPS. This parameter specifies the maximum capacity a link is permitted when sufficient unused capacity is present on the host card.

NOTE: This parameter can be specified only for links in IPSP linksets.

Range: **100-9500**

NOTE: The maximum value that can be specified for the maxslktps parameter depends on the type of IPSP card that is used and whether the E5-ENET-B IPSP High Throughput feature is turned on:

- **E5-ENET card—5000 TPS**
- **E5-ENET-B card when the E5-ENET-B IPSP High Throughput feature is turned off—6500 TPS**
- **E5-ENET-B card when the E5-ENET-B IPSP High Throughput feature is turned on—9500 TPS**

Default: No change to the current value

System

Default: **6500**

:mtprese= (optional)

ANSI or ITU MTP Restart equipped. This parameter specifies whether the node adjacent to the linkset is equipped with MTP Restart.

- Range:** **yes, no**
yes — equipped
no — not equipped

Default: No change to the current value

:multgc= (optional)

Multiple group codes. The parameter specifies whether multiple group codes can be specified.

Range: **yes, no**

:nis= (optional)

Network Indicator Spare. This parameter specifies whether the Network Indicator Spare option is on or off for the specified linkset. When this option is enabled, the Network Spare value for network indicator for both ANSI and ITU-National (ITU-N) links is supported by the system.

Range: **on, off**

Default: **off**

:nlsn= (optional)

New linkset name.

- Range:** *ayyyyyyyyy*
Up to 10 alphanumeric characters; the first character must be a letter

Default: No change to the current value

:randsls= (optional)

Random SLS (signaling link selection). This parameter is used to apply random SLS generation on a per linkset basis.

Specifying the **randsls** parameter in the **chg-ls** command enables random SLS generation on a per linkset basis only if the **randsls=perls** parameter has been specified in the **chg-stpopts** command.

Range: **off, class0, all**
off— disables random SLS generation on a specified linkset
class0— enables random SLS generation for Class0 SCCP traffic on a specified linkset
all— enables random SLS generation for Class0 and Class1 SCCP traffic on a specified ITU linkset and for Class0 and ISUP traffic on a specified ANSI linkset

Default: No change to the current value

:rcontext= (optional)

Routing Context. This parameter specifies a new routing context for an IPSPG-M3UA linkset.

Range: **0-4294967295**
Default: No change to the current value

:sapci= (optional)

ITU international secondary adjacent point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—**s-, p-, ps-**
zone—**0-7**
area—**000-255**
id—**0-7**
The point code **0-000-0** is not a valid point code.

:sapci/sapcn/sapcn24= (optional)

Secondary adjacent point code.

:sapcn= (optional)

ITU national secondary adjacent point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—**s-, p-, ps-**
nnnnn—**0-16383**
gc—**aa-zz**
m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:sapcn24= (optional)

24-bit ITU national secondary adjacent point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—**p-**

msa—000–255

ssa—000–255

sp—000–255

:scrn= (optional)

Gateway screening screen set. This parameter specifies the gateway screening screen set assigned to this linkset.

When using the **scrn** parameter to change Gateway Screening from an old screenset name with Gateway Screening Allowed Mode **gwsa=off** to a new screenset name with **gwsa=on**, the command must first be entered to assign the screenset name to NONE (**scrn=none**). This assignment will prevent any rules from the old screenset from being applied during the interim period that it takes for the new screenset to load.

Range: *ayyy*, **none**

1 alphabetic character followed by up to 3 alphanumeric characters

none—deletes the screen set association

Default: No change to the current value

:slktps= (optional)

Reserved per signaling link TPS for IPSP Linkset. This parameter specifies the capacity guaranteed for each link in the linkset.

NOTE: This parameter is required for each link in an IPSP linkset and can be specified only for links in IPSP linksets.

Synonym: *rsvdslktps*

Range: **0-9500**

NOTE: The maximum value that can be specified for the slktps/rsvdslktps parameter depends on the type of IPSP card that is used and whether the E5-ENET-B IPSP High Throughput feature is turned on:

NOTE:

- **E5-ENET card—5000 TPS**
- **E5-ENET-B card when the E5-ENET-B IPSP High Throughput feature is turned off—6500 TPS**
- **E5-ENET-B card when the E5-ENET-B IPSP High Throughput feature is turned on—9500 TPS**

Default: No change to the current value

:slkusealm= (optional)

IPTPS signaling link alarm threshold percent. This parameter specifies the percent of the link TPS at which an alarm is generated to indicate that the actual link TPS is approaching the alarmed IPTPS (*slktps/rsvdslktps* or *maxslktps*) configured for the link.

Range: **10-100**

Default: No change to the current value

System

Default: **80**

:slsci= (optional)

5-bit to 8-bit SLS conversion indicator. This parameter specifies whether the 5-bit to 8-bit SLS conversion feature is used to select links for outgoing messages direct to the given linkset. When enabled, the system replaces any 5-bit SLS values contained in received messages, with a random 8-bit value before the 5-bit SLS values are used by the STP to select the outgoing link in that linkset.

Range: **yes, no**

yes — enabled
no — disabled

Default: No change to the current value

:slsobit= (optional)

Other CIC (Circuit Identification Code) Bit. If the SLSOCB feature is turned on, this parameter specifies whether the Other CIC Bit option is to be used during link selection. If the option is to be used, specify which bit (5– 16) of the CIC is to be used as the other CIC bit. During link selection, the specified bit acts as the most significant bit of the new SLS and bits 2 through 4 of the received CIC become the least significant bits of the new SLS. This parameter is used for ITU-ISUP messages. The SLS is not modified in the outgoing message. The following example shows a received CIC where bit 9 is the other CIC bit (**:slsobit=9**). The new SLS is 0100:

16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
0	0	0	0	1	0	0	0	1	0	0	1	1	0	0	1
New SLS								0				1	0	0	

Range: 5-16 none

Default: No change to the current value

:slsrsb= (optional)

Rotated SLS (Signaling Link Selection) Bit. This parameter specifies the bit (1–4) to rotate as the new SLS LSB (Least Significant Bit). The SLS is not modified in the outgoing message.

Table 5-27 shows how the rotation affects the SLS during linkset selection.

This parameter is used for ITU messages on a per-linkset basis.

Range: 1-4

Default: No change to the current value

:sltset= (optional)

SLTM record. This parameter specifies the SLTM record to be associated with the linkset.

Range: 0-20

0—sets the linkset to SLT reflect mode

Default: No change to the current value

:spc= (optional)

ANSI secondary point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: spca

Range: 000-255, none

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

Enter **none** to delete the point code.

The point code 000-000-000 is not a valid point code.

:spc/spca/spci/spcn/spcn24= (optional)

Secondary point code.

:spci= (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

Enter **none** to delete the point code.

The point code **0-000-0** is not a valid point code.

:spcn= (optional)

ITU national secondary point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

Enter **none** to delete the point code.

:spcn24= (optional)

24-bit ITU national secondary point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Enter **none** to delete the point code.

:tfatcabmlq= (optional)

TFA/TCA broadcast minimum link quantity. This parameter specifies the minimum number of links in the given linkset, or in the combined linkset in which the linkset resides, that must be available to user-part messages traffic. This parameter value is used by the STP to consider the first-choice ordered routes using that linkset as Allowed rather than Restricted.

If the **tfatcabmlq** parameter provisioned or default value is **0**, then the TFA/TCA broadcast minimum link quantity is calculated by the EAGLE 5 ISS to be either **1** for linksets containing 2 or fewer links, or half (rounded-up) of the number of links configured in the linkset for linksets containing more than 2 links.

If the **tfatcabmlq** parameter value is set to a specific value greater than **0**, then the EAGLE 5 ISS does not calculate a TFA/TCA broadcast minimum link quantity. The specified value is used.

If the **lsrestrict** option is **off** (see the **chg-ss7opts** command), then the **tfatcabmlq** database value for C linksets cannot be changed to a value greater than **0**. If the **lsrestrict** option is **on** (see the **chg-ss7opts** command), then the **tfatcabmlq** value for C linksets (**lst=c**) can be set to a value from **1** to **16**. If the **tfatcabmlq** value for one or more C linksets in the system is changed, then the **lsrestrict** option cannot be set from **on** to **off** until all of the changed C linkset **tfatcabmlq** values are changed back to **0**.

NOTE: The rtrv-ls command output always shows the calculated value or the provisioned value for the tfatcabmlq parameter. See the rtrv-ls command description.

Range: 0, 1-16
Default: No change to current value.
System
Default: 0

:tpsalmttype= (optional)

IPSG IPTPS threshold alarm type. This parameter specifies which IPTPS threshold can be alarmed.

Range: rsvdslktps, maxslktps
rsvdslktps — the SLKTPS/RSVDSLKTPS threshold is alarmed
maxslktps — the MAXSLKTPS threshold is alarmed
Default: No change to the current value
System
Default: rsvdslktps

Example

Changes link set wy644368 to use APC 144-202-5

```
chg-ls:lsn=wy644368:apc=144-202-005
```

Changes link set wy644368 to Link Set Type A

```
chg-ls:lsn=wy644368:lst=a
```

Adds an SAPC to a linkset

```
chg-ls:lsn=linkset:sapcn=1234-fr:action=add
```

```
chg-ls:lsn=c002:gwsm=on:nis=on
```

```
chg-ls:lsn=nc003:sltm=reg:lst=b
```

Adds a 24-bit ITU-N SAPC to a linkset

```
chg-ls:lsn=ls1:sapcn24=5-5-5
```

Deletes a 24-bit ITU-N SAPC from a linkset:

```
chg-ls:lsn=ls1:sapcn24=5-5-5:action=delete
```

Assigns a mate linkset to a linkset:

```
chg-ls:lsn=linkset:matelsn=matelinkset
```

Changes an ITUN24 linkset to an apcntype for China:

```
chg-ls:lsn=ls2:apcntype=itunchina
```

```
chg-ls:lsn=nc003:slsci=yes:tfatcabmlq=2
```

```
chg-ls:lsn=lsitul:gmscrn=off
```

```
chg-ls:apca=p-011-2-3:lsn=lsa1:lst=a
```

```
chg-ls:lsn=ls1:randsls=all
```

Indicates that calling party GT modification is required

chg-ls:lsn=ls1:apc=1-1-1:cggmod=yes

Changes the linkset's SPC value.

chg-ls:lsn=ls1:spc=100-23-48

Changes the adapter of a specified IPSG linkset.

chg-ls:lsn=ls2:adapter=m2pa

Changes the AS notification status and routing context value for an IPSG-M3UA linkset.

chg-ls:lsn=m3ua33:rcontext=9999:action=add

Converts the linkset to IPSG.

chg-ls:lsn=m2pa33:ipsg=yes

This command changes the Incoming SLS Bit Rotation value to 6 for ANSI link sets

chg-ls:lsn=ls1:islsrsb=6

Changes the gttmode value to FLOBR CdPA when the FLOBR feature is turned on.

chg-ls:lsn=ls3:gttmode=fcd

Converts the linkset to SLT reflect mode.

chg-ls:lsn=ls1:sltset=0

Dependencies

A valid screenset name must be associated with the linkset, or the **scrn** parameter must be specified with a valid screenset name before the **gwsa**, **gwsn**, and **gwsd** parameters can be specified.

The **gwsd=on** parameter can be specified only if the **gwsa=on** parameter is specified.

At least one optional parameter must be specified.

If the **lsrestrict** option is **off** (see the **chg-ss7opts** command), the **tfatcabmlq** database value for C linksets cannot be changed from the system default of **0**. If the **lsrestrict** option is **on** (see the **chg-ss7opts** command), the **tfatcabmlq** value for C linksets (**lst=c**) can be set to a value from **1** to **16**. If you change the **tfatcabmlq** value for one or more C linksets in the system, you cannot set the **lsrestrict** option from **on** to **off** until you set all of the changed C linkset **tfatcabmlq** values back to **0**. C linksets are never the primary route (except to reach the STP's mate).

The **tfatcabmlq** parameter value cannot exceed the total number of assigned links in the linkset.

The linkset name must be in the database.

The screen set name specified by the **scrn** parameter must be valid and must be in the database.

Adjacent point codes must be full point codes.

The adjacent point code must be defined as a destination point code.

The adjacent point code cannot match the site point code.

The domain of the new adjacent point code must be the same as the previous adjacent point code unless there are no links in the linkset.

Only one linkset can be defined for an adjacent point code.

An SAPC cannot be deleted when routes exist for its SS7 domain.

If the **gwsa=off** and **gwsn=off** parameters are specified, all MSUs are passed. If the **gwsa=off** and **gwsn=off** parameters are specified for all linksets, gateway screening and the GWS redirect function for the DTA feature are disabled.

If the **gwsa=on** and **gwsn=off** parameters are specified, MSUs are screened but messages are not generated.

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

The **mtprse** parameter can be specified only if the MTP restart feature, MTPRS (for ANSI), or ITUMTPRS (for ITU), is turned on. The **rtrv-feat** command can be used to verify whether the feature is turned on (MTPRS=YES or ITUMTPRS=YES in the output).

If the **ipgwapc=yes** or **ipsg=yes** parameter is specified, then the **mtprse=yes** parameter cannot be specified.

The **mtprse=yes** parameter is not valid for IPGWx and IPSP-M3UA signaling links.

The **clli** parameter and the **apc/apca/apci/apcn/apcn24** parameter must be specified together in the command.

The value of the **cilli** parameter must match the **cilli** of the current site.

The **asl8=yes** parameter can be assigned only to an SS7 linkset (a linkset containing an adjacent point code in the SS7 domain).

The **apcn** parameter format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

An SAPC parameter can be specified only for ITU-N and ITU-N24 linksets.

The **slsobit** parameter is valid only for ITU linksets.

The **slrsrb** parameter is valid only for ITU linksets.

The GSM Map Screening feature must be turned on before the **gmscrn** parameter can be specified.

The Enhanced GSM Map Screening feature must be turned on before the **gmscrn=on** parameter can be specified for an ANSI linkset.

The **itutfr** parameter is valid only for ITU national linksets.

The group code of DPC(s) must match the group code of the APC/SAPC when the **multgc=no** parameter is specified. If the adjacent point code's group code is changed, the **multgc=yes** parameter must be specified, or there must be no routes using the linkset. The **multgc** parameter value can be changed to **no** only if there are no routes with group codes different from the adjacent point code's group code.

Only one ITU-N APC/SAPC is allowed with the **multgc=no** parameter.

Only one ITU-I or 24-bit ITU-N APC/SAPC is allowed per linkset

The **apctype** parameter can be specified only for ITU-N and ITU-N24 linksets.

A linkset cannot have both a 14-bit ITU-N and a 24-bit ITU-N APC/SAPC unless it contains only IPGWI links or IPLIM M3UA links. These links support 14-bit ITU-N and 24-bit ITU-N traffic simultaneously. A linkset with the **ipgwapc=no** parameter cannot have both a 14-bit ITU-N and a 24-bit ITU-N APC/SAPC if no links are provisioned. The SAPC cannot be a 24-bit ITU-N point code if the linkset contains IPLIM or E1 ATM links, which do not support 24-bit ITU-N traffic.

Private (**p-**) and private and spare (**ps-**) point codes can be assigned only to IPGW linksets (the **ipgwapc=yes** parameter is specified).

The **iptps** parameter cannot be specified for linksets that are not IPGWx.

The **ipgwapc=yes** or **ipsg=yes** parameter must be specified before the **lsusealm** parameter can be specified.

The **ipgwapc=yes** or **ipsg=yes** parameter must be specified before the **slkusealm** parameter can be specified.

The specified linkset name (**lsn**) cannot be the same as the specified mate linkset name (**matelsn**).

If the **action=add** parameter is specified, the specified mate linkset cannot already be assigned as the mate of the specified linkset.

When the **action=add** parameter is specified, the specified mate linkset cannot already be the mate of another linkset.

The specified mate linkset must be an existing linkset in the database.

A mated linkset can have only one assigned link.

Mated linksets can contain only SS7IPGW or IPGWI links.

Mated linksets must have APCs of the same network type.

The card that has the link assigned to the specified linkset must be inhibited before the **action=add** parameter can be specified to assign the specified mate linkset to the specified linkset.

The card that has a link in the mate linkset must be inhibited before the **action=delete** parameter can be specified to delete the mate linkset assignment.

If the **action=delete** parameter is specified to delete a mate linkset assignment, the specified mate linkset must be the mate of the specified linkset in the database.

If the **action=delete** parameter is specified, then the **sapc**, **matelsn**, or **rconext** parameter must be specified. The parameters cannot be specified together in the command.

The **mtrprse** parameter can be specified only if the MTP restart feature ITUMTPRS (for ITU) is turned on. The **rtrv-feat** command can be used to verify whether the feature is turned on (ITUMTPRS=YES in the output).

The **slosochit** parameter is valid only if the SLSOCB feature is turned on.

The adjacent point code cannot match the capability point code.

An APC cannot be changed to a point code that has exception routes provisioned

The **apc** or **sapc** parameter cannot be specified for an IPGWx linkset that is already assigned to a route involving another linkset.

The Origin-based SCCP Routing feature must be turned on before the **gttmode** parameter can have a value of **acdcdd**, **cgacdcdd**, **acdcgdd**, **acdcddcg**, **cgcd**, **cdcg**, or **cg**.

The APC/SAPC of an existing IPGW link set cannot be changed to an APC/SAPC that is already configured in a routing key.

All links assigned to the linkset must be removed before changing the **apcntype** parameter value from **apcn** to **apcn24** or from **apcn24** to **apcn**.

If one or more of the links in the specified linkset are in service, then the **apc/apca/apci/apcn/apcn24** parameter cannot be specified.

If **apcn** is specified for the Adjacent Point Code then the format of **apcn** must match the format dictated by the **n pcfmti** parameter via the **chg-stpopts** command.

Gateway linksets must be configured from a SEAS terminal.

If the system is configured for ANSI formatted point code, the network indicator value of the foreign pointcode parameter must be 6 or greater when the cluster value is 0.

The value of the **apc/apca/apci/apcn/apcn24** or **sapc/sapca/sapci/sapcn/sapcn24** parameter cannot be assigned to more than one linkset.

The new **apc/apca/apci/apcn/apcn24** parameter must have the same point code type as the **apc/apca/apci/apcn/apcn24** parameter currently specified for the linkset.

The value of the **apc/apca/apci/apcn/apcn24** parameter must exist in the Point Code table.

The **lst** parameter must have a value of **b**, **c**, or **d** if a network or cluster route is configured through the linkset.

If the **multgc=yes** parameter is specified, then an IPGWI or IPLIMI link must be specified.

If the ITUDUPPC feature is off, then the **multgc=yes** parameter cannot be specified.

If the **multgc=yes** parameter is specified, then the **apci**, **apcn**, or **apcn24** parameter must be specified.

The value of the **sapc/sapca/sapci/sapcn/sapcn24** parameter must exist in the Destination Point Code table.

The **apc/apca/apci/apcn/apcn24** or the **sapc/sapca/sapci/sapcn/sapcn24** parameter can be defined only once per linkset.

The maximum number of **sapc/sapca/sapci/sapcn/sapcn24** entries has been exceeded.

The value of the specified **lsn** parameter already exists in the database.

The specified **matelsn** parameter be already equipped in the linkset database.

If the linkset is not mated to the linkset specified by the **matelsn** parameter, then **action=delete** parameter cannot be specified.

The value specified for the **spc** parameter must be a valid full point code.

The values specified for the **spc** and **apc** parameters must have the same network type.

If the **sapc**, **matelsn**, **rcontext**, or **action** parameter is specified, then those four parameters are the only optional parameters that can be specified. If the **action** parameter is specified, then the **sapc** or **rcontext** or **matelsn** parameter must be specified. If the **ipsg** parameter is specified, then no other optional parameters can be specified.

The Multiple Linksets to Single Adjacent PC (MLS) feature must be turned on before the **spc** parameter can be specified.

The value specified for the **spc** parameter must already exist in the SPC table.

The point code type of the value specified for the **spc** parameter must be the same as the point code type of the value of the existing **spc** parameter.

The value specified for the **spc** parameter cannot already be specified as a secondary point code for an adjacent destination point code.

The value specified for the **apc** parameter must differ from the adjacent point code of the linkset specified by the **lsn** parameter.

The value specified for the **spc** parameter must differ from the secondary point code of the linkset specified by the **lsn** parameter.

If a proxy linkset is used, then the **apc**, **sapc**, **action**, and **lst** parameters cannot be specified.

An IPGW linkset cannot be moved to a node that already contains a linkset.

If an IPGW linkset is used, then the value specified for the **apc** parameter cannot be associated with a proxy point code.

If the **ipgwapc=yes** parameter is specified, then the **spc** parameter cannot be specified.

The specified combination of the **apc** and **spc** parameters must be unique for each linkset.

The specified combination of the **apc** and **sapc** parameters must be unique for each linkset.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the **cggtmod** parameter can be specified.

The **ipgwapc=yes** parameter and the **ipsg=yes** parameter cannot be specified together in the command.

The **ipsg=yes** parameter must be specified before the **adapter** parameter can be specified.

The **ipsg=yes** and **adapter=m3ua** parameters must be specified before the **asnotif** parameter can be specified.

The **ipsg=yes** and **adapter=m3ua** parameters must be specified before the **rcontext** parameter can be specified.

If the IPSTG linkset contains links, then the **adapter** parameter cannot be specified.

The **ipgwapc=yes** parameter must be specified before the value specified for the **apc** parameter can be an invalid point code (ANSI network = 0).

The **ipgwapc=yes** parameter must be specified before the **iptps** parameter can be specified.

The value specified for the **iptps** parameter must be divisible by 10.

The **ipsg=yes** parameter must be specified before the **slktps/rsvdslktps** or **maxslktps** parameter can be specified.

If the **ipsg=yes** and **adapter=m3ua** parameters are specified, then the **lst=a** parameter must be specified.

A maximum of 1 IPGW linkset or maximum of 6 of any other linksets are allowed between any APC and the EAGLE 5 ISS.

If the HIPR2 High Rate Mode feature is turned off, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 500,000. If the HIPR2 High Rate Mode feature is turned on, then the sum of the TPS values assigned to all linksets in the system must be less than or equal to 750,000.

The value specified for the **slktps/rsvdslktps** parameter cannot cause the card to exceed the total maximum capacity of the card.

If the **ipsg=yes** and **adapter=m3ua** parameters are specified, then the **multgc=yes** parameter cannot be specified.

If the **ipsg=yes** and **adapter=m3ua** parameters are specified, then the **tfatcabmlq** parameter cannot be specified.

If the **action=delete** parameter is specified to delete the routing context, then the value specified for the **rcontext** parameter must be the value used by the specified linkset in the database.

If the linkset already contains IPSTG links, then the **ipsg=no** parameter cannot be specified.

If the **ipsg=yes** and **adapter=m3ua** parameters are specified, then a secondary adjacent point code cannot be specified for the linkset.

If one or more links in a specified linkset are in service, then the **rcontext** parameter cannot be specified.

Multiple signaling links in a single linkset cannot share the same association.

If multiple linksets share an association, then the **rcontext** parameter cannot be specified for only one linkset.

The value specified for the **rcontext** parameter must already exist in the database.

If a linkset shares an association with another linkset, then a unique value for the **rcontext** parameter must be specified for each linkset.

If the **ipsg=yes** parameter is specified, then the **slktps/rsvdslktps** parameter must be specified.

If the **multgc=yes** parameter is specified, then all links assigned to the linkset must be of the same type.

If any of the links are not in the OOS state, then the **rcontext** parameter cannot be specified.

The ISLSBR feature must be enabled before the **islsrsb** parameter can be specified.

The FLOBR feature must be turned on before the **gtmode** parameter can have a value of **fed**, **fcg**, **fcgfd**, or **fedfcg**.

The **rsls8=yes** parameter (see the **chg-lsopts** command) must be specified for an ANSI linkset before a value greater than **5** can be specified for the **islsrsb** parameter.

If an ITU linkset is used, then a value of **1-4** must be specified for the **islsrsb** parameter.

The value specified for the **slktps/rsvdslktps** parameter must be less than or equal to the value specified for the **maxslktps** parameter.

The value specified for the **slktps/rsvdslktps** and **maxslktps** parameters must be within the allowed range.

The **sltset=0** parameter can be specified only for a type A linkset (**lst=a**).

Notes

Any optional parameter that is not specified is not changed.

The links that directly connect the system with a distant node are grouped into one or more linksets. A linkset can contain up to 8 (international standards) or 16 (national standard) signaling links, depending on how the system attributes were defined when the network was created.

Signaling link test acknowledgments (SLTA) are the same type of maintenance message as the SLTMs received on the link.

MTP restart provides an orderly process for bringing signaling links back into service after the system has been isolated and restarted. A greater preference is given to restoring the STP to network service in an orderly fashion than to the speed of recovery. The time required is system dependent as shown:

- up to 64 LIMs—62 seconds (Link Alignment Delay)
- 64 - 127 LIMs—97 seconds
- 128 - 191 LIMs—132 seconds
- more than 191 LIMs—167 seconds

When two linksets are used as a combined linkset, each linkset should have the same **slsci** and **asl8** values and the same **slsocbit** and **slsrsb/slsrsb** values.

CAUTION: This is not enforced in the system and there is no warning mechanism if the values of these parameters are not the same for each linkset.

The **slsrsb** parameter alone does not provide an even distribution of ITU-ISUP messages across all links within a linkset. The system uses all four bits of the SLS to determine the actual link to route messages. Because the static bit is simply rotated within the SLS, all possible values of the SLS field will still not be realized. The **slsocbit** parameter must also be used to provide an even distribution across all links within the linkset. If both parameters are used for a given linkset, the SLS field is processed in the following order.

1. The SLS is modified using the Other CIC Bit option.
2. The modified SLS is modified again using the Rotated SLS Bit option.
3. The modified SLS is used by the existing linkset and link selection algorithms to select a link.
4. The ISUP message is sent out of the link containing the original, unmodified SLS field.

To modify a secondary adjacent point code, **sapc** has to be first deleted, then added again.

A 24-bit ITU-N point code can be provisioned as an SAPC only if the APC is not already a 24-bit ITU-N point code.

Only one 24-bit ITU-N point code is allowed to be provisioned as an SAPC.

For a linkset containing either low speed CCS7ITU links or IPLIM M2PA links, if the APC is a 14-bit ITU-N point code, then a 24-bit ITU-N point code cannot be provisioned as an SAPC.

For a linkset containing either low speed CCS7ITU links or IPLIM M2PA links, if the APC is a 24-bit ITU-N point code, then a 14-bit ITU-N point code cannot be provisioned as a SAPC.

For a linkset containing either low speed CCS7ITU links or IPLIM M2PA links, if the APC is a ITU-I point code, then either a 24-bit ITU-N point code or a 14-bit ITU-N point code can be provisioned as an SAPC, but not both

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

The ITU National and ITU National China Adjacent Point Code types indicate the format that is used for changeover and changeover acknowledgement messages. China specifies a 16-bit field for data in changeover messages. The FSN occupies the first 12 bits. The trailing 4 bits are spare and are coded as 0. ITU uses a 24-bit field for data in the extended changeover/changeover acknowledgement messages. The FSN is encoded in the first 12 bits. The last 12 bits of the field are spare and are coded as zero.

The **randsls** parameter value applies to SCCP ITU-T messages and Class0 and ISUP ANSI messages when random SLS generation is set to occur on a per linkset basis (the **randsls=perls** parameter is specified in the **chg-stpopts** command).

If the **randsls=perls** parameter is specified in the **chg-stpopts** command, it is recommended that the linksets in a combined linkset be provisioned with the same **randsls** value to avoid undesired SLS distribution.

The **tfatcabmlq=0** parameter specifies that the system broadcasts TFAs or TCAs only when half the links in the given linkset, or in the combined linkset in which it resides, become available.

A gateway linkset can be configured only from a SEAS terminal and not from a system terminal.

If the **gwsa=off** and **gwsn=on** parameters are specified, then all MSUs pass. Error messages are generated if an MSU matches a screening condition.

If the **gwsa=on** and **gwsn=off** parameters are specified, then MSUs are screened but messages are not generated.

If the **gwsa=off** and **gwsn=on** parameters are specified, then gateway screening is defined to be in the screen test mode. The gateway screening action in the stop action set specified by the **actname** parameter of the screen set is performed at the end of the screening process.

If the **asl8=yes** and the **lst=a** (a linkset containing access signaling links) parameters are specified, then the originator of the MSUs is generating 8-bit SLSs. For other linkset types, the **asl8=yes** parameter indicates that the adjacent STP is converting 5-bit SLSs to 8-bit SLSs. The SLS in MSUs received by the system on a linkset that has the **asl8=yes** parameter assigned is not converted. These MSUs are assumed to contain 8-bit SLSs.

If the **gwsa=on**, **gwsn=on**, and **gwsd=off** parameters are specified, then MSUs are screened, and error messages are generated if an MSU is passed when it should have been screened.

If the ISLSBR feature is turned on, and Incoming SLS Bit Rotation is applied to an MSU, then the outgoing SLS bit rotation is not applied for that MSU. If the ISLSBR feature is turned off, or Incoming SLS Bit Rotation is not applied to an MSU, then the outgoing SLS bit rotation is applied for that MSU.

The valid ISLSRSB values are **1-4** for ITU linksets and **1-8** for ANSI linksets.

The **randsls** parameter is applied on incoming linksets for ANSI messages and on outgoing linksets for ITU messages.

Output

The following example displays the output that results if the secondary point code is changed.

chg-ls:lsn=ls1:spc=100-23-48

```
rlghncxa03w 07-07-18 08:16:14 EST EAGLE 37.5.0
CAUTION: Linkset SPC has changed - verify remote node's route.
Link set table is (114 of 1024) 1% full
```

```
CHG-LS: MASP A - COMPLTD
```

The following example displays the command output when GTT mode is changed to FLOBR CdPA.

chg-ls:lsn=ls3:gttmode=fcd

```
tekelecstp 09-04-12 13:34:33 EST EAGLE 41.0.0
Link set table is (5 of 1024) 1% full.
```

```
CHG-LS: MASP A - COMPLTD
```

```
;
```

chg-lsopts**Change Linkset Options**

Use this command to administer the thresholds for IPSPG-M3UA linksets and to set SLS bit rotation for ANSI linksets.

Keyword: **chg-lsopts**

Related Commands: **chg-ls, rtrv-ls**

Command Class: Database Administration

Parameters

:lsn= (mandatory)

Linkset name. This parameter specifies the name of the linkset. Each linkset name must be unique in the system.

Range: *ayyyyyyyyy*
1 alphabetic character followed by up to 9 alphanumeric characters.

:icnimap= (optional)

Incoming NI Map. This parameter specifies the NI mapping for incoming MSUs on a linkset. The NI value in the incoming MSU is changed to the value specified by the **icnimap** parameter before processing the message.

Range: **itui2ituis, ituis2itui, itun2ituns, ituns2itun, none**
itui2ituis — Map ITU International to ITU International Spare
ituis2itui — Map ITU International Spare to ITU International
itun2ituns — Map ITU National to ITU National Spare
ituns2itun — Map ITU National Spare to ITU National
none — NI mapping is not performed on the specified linkset.

Default: No change to the current value

System

Default: **none**

:numslkalw= (optional)

Number of signaling links allowed. This parameter specifies the IS-NR link count threshold required for an IPSPG-M3UA linkset to transition from the Restricted or Prohibited state to the Allowed state.

When the number of IS-NR links in an IPSPG-M3UA linkset transitions from a value less than **numslkalw** to a value equal to or greater than **numslkalw**, the linkset transitions to the allowed state.

Range: **0-16**
0—The IS-NR link count threshold value for an IPSPG-M3UA linkset is considered to be half of the number of links configured in the linkset.

Default: No change to current value

System

Default: 1

:numslkproh= (optional)

Number of signaling links required to prohibit a linkset. This parameter specifies the IS-NR link count threshold required for an IPSP-M3UA linkset to transition from the Restricted or Allowed state to the Prohibited state.

When the number of IS-NR links in an IPSP-M3UA linkset transitions from a value equal to or greater than **numslkproh** to a value less than **numslkproh**, the linkset transitions to the Prohibited state.

Range: 0-16

0—The IS-NR link count threshold value for an IPSP-M3UA linkset is considered to be half of the number of links configured in the linkset.

Default: No change to current value

System

Default: 1

:numslkrstr= (optional)

Number of signaling links required to restrict a linkset. This parameter specifies the IS-NR link count threshold required for an IPSP-M3UA linkset to transition from the Allowed state to the Restricted state.

When the number of IS-NR links in an IPSP-M3UA linkset transitions from a value equal to or greater than **numslkrstr** to a value less than **numslkrstr** and greater than **numslkproh**, the linkset transitions from the Allowed state to the Restricted state. Transition from the Prohibited state to the Restricted state is not supported.

Range: 0-16

0—The IS-NR link count threshold value for an IPSP-M3UA linkset is considered to be half of the number of links configured in the linkset.

Default: No change to current value

System

Default: 1

:ognimap= (optional)

Outgoing NI Map. This parameter specifies the NI mapping for outgoing MSUs on a linkset. The NI value in the processed MSU is changed to the value specified by the **ognimap** parameter for that linkset before routing the message to the intended destination.

Range: **itui2ituis, ituis2itui, itun2ituns, ituns2itun, none**

itui2ituis — Map ITU International to ITU International Spare

ituis2itui — Map ITU International Spare to ITU International

itun2ituns — Map ITU National to ITU National Spare

ituns2itun — Map ITU National Spare to ITU National.

none — NI mapping is not performed on the specified linkset.

Default: No change to the current value

System

Default: none

:pct= (optional)

Point Code and CIC Translation. This option specifies whether to apply PCT to the specified linkset.

Range: **off, on**

off — do not apply PCT to the linkset

on — apply PCT to the linkset

Default: **off**

:rsls8= (optional)

Rotate SLS by 5 or 8 bits. This parameter specifies whether the signaling link selector (SLS) of the incoming ANSI linkset is rotated by 5 or 8 bits.

Range: **yes, no**

yes — 8 bit SLS of the incoming linkset is considered for bit rotation

no — 5 bit SLS of the incoming linkset is considered for bit rotation

Default: No change to the current value

System

Default: **no**

Example

The following example changes the threshold value of the **numslkproh** parameter to 3 for an IPSP-M3UA linkset.

```
chg-lsopts:lsn=1sm3ua1:numslkproh=3
```

The following example sets the incoming and outgoing NI Mapping for a linkset.

```
chg-lsopts:lsn=1snimap1:icnimap=itun2ituns:ognimap=ituns2itun
```

The following example sets 8 bit incoming bit rotation for an ANSI link set

```
chg-lsopts:lsn=1s1:rsls8=yes
```

```
chg-lsopts:lsn=1s111:pct=on
```

Dependencies

The value specified for the **numslkproh** parameter cannot be greater than the value specified for the **numslkrstr** parameter.

The value specified for the **numslkrstr** parameter cannot be greater than the value specified for the **numskalw** parameter.

The value specified for the **lsn** parameter must indicate an IPSP-M3UA linkset before the **numskalw**, **numslkproh**, and **numslkrstr** parameters can be specified.

The value specified for the **numskalw**, **numslkproh**, or **numslkrstr** parameter cannot be greater than the number of links configured in the IPSP-M3UA linkset.

The ITU National and International Spare Point Code Support feature must be enabled before the **icnimap** and **ognimap** parameters can be specified.

The **icnimap** and **ognimap** parameters must be specified together in the command.

The NI mapping for incoming messages in a linkset must be compatible with the NI mapping for the outgoing messages.

Values for the **icnimap** and **ognimap** parameters other than **none** can be specified only for ITU-I and ITU-N APCs of the linkset.

An ANSI linkset must be specified by the **lsn** parameter before the **rsls8=yes** parameter can be specified.

The ISLSBR feature must be enabled before the **rsls8** parameter can be specified.

A PCT quantity feature must be enabled before the **pct** parameter can be specified.

Notes

The values specified for the **icnimap** and **ognimap** parameters for a linkset must be compatible. The following table shows the relationship between the parameters for a linkset.

NI Mapping Rules	
ICNIMAP	OGNIMAP
ITUI2ITUIS	ITUIS2ITUI
ITUIS2ITUI	ITUI2ITUIS
ITUN2ITUNS	ITUNS2ITUN
ITUNS2ITUN	ITUN2ITUNS
NONE	NONE

If the **rsls8=yes** parameter is specified, then 8 bits of the Incoming ANSI SLS are used for the ISLSBR feature. If the **rsls8=no** parameter is specified, then 5 bits are used.

Table 5-12 summarizes the cases in which rotation is done on the Incoming ANSI SLS bits:

Table 5-12. Incoming SLS Bit Rotation for ANSI Linksets

Number of Incoming SLS Bits	RSLs8	Valid range of values of ISLSRSB	SLSCNV/SLSCI	If Incoming SLS bits are rotated or not
5	No	1-5	No	Yes
5	No	1-5	Yes	Yes (Lower 5 bits)
5	Yes	1-8	No	No
5	Yes	1-8	Yes	Yes
8	No	1-5	Yes/No	Yes (Lower 5 bits)
8	Yes	1-8	Yes/No	Yes

Output

```
chg-lsopts:lsn=ls1:rsls8=yes
tekelecstp 09-03-03 10:52:55 EST EAGLE 41.0.0
Command entered at terminal #4.
Link set table is (7 of 1024) 1% full.
CHG-LSOPTS: MASP A - COMPLTD
```

chg-m2pa-tset

Change M2PA Timer Set

Use this command to change M2PA timers in an M2PA timer set. The **srcset** and **tset** parameters can be used to copy from one timer set to another.

NOTE: The M2PA RFC feature introduces 20 new timer sets. M2PA timer sets created prior to this feature become M2PA Draft 6 timer sets, which are used by the M2PA Draft 6 associations. M2PA RFC associations use the RFC timer sets.

Keyword: chg-m2pa-tset

Related Commands: rtrv-m2pa-tset

Command Class: Database Administration

Parameters

:tset= (mandatory)

Timer set. This parameter specifies the name of the M2PA timer set.

Range: 1-20

:srctset= (optional)

This parameter specifies which timer set is to be copied into the timer set specified by the **tset** parameter. If the **srctset** parameter is specified, no other timer values can be specified. The timer set specified by the **srctset** parameter cannot be the same timer set that is specified by the **tset** parameter.

Range: 1-20

:t1= (optional)

T1 timer. This parameter specifies the alignment timer in milliseconds. This timer marks the amount of time M2PA waits to receive a Link Status Alignment message from the peer.

Range: 1000-350000

Default: 10000 - D6

35000 - RFC

:t16= (optional)

T16 timer. This parameter specifies the proving rate timer in milliseconds. This timer marks the amount of time between sending Link Status Proving messages while T2N or T2E is running. The T16 value is given in microseconds.

Range: 100-500000

Default: 200000

:t17= (optional)

T17 timer. This parameter specifies the ready rate timer in milliseconds. This timer marks the amount of time between sending Link Status Ready messages while T3 is running.

Range: 100-500

Default: 250

:t18= (optional)

T18 timer. This parameter specifies the processor outage rate timer. This timer marks the amount of time between sending Link Status Processor Outage messages while the link is in service.

Range: 100-10000

Default: 1000

:t2= (optional)

T2 timer. This parameter specifies the M2PA RFC timer.

The T2 timer is not used in M2PA Draft 6 timer sets.

Range: 5000-150000

Default: 20000

:t3= (optional)

T3 timer. This parameter specifies the ready timer in milliseconds. This timer marks the amount of time after proving that M2PA waits to receive a Link Status Ready message from the peer.

Range: 1000-60000

Default: 10000 - D6
2000 - RFC

:t4e= (optional)

T4E timer. This parameter specifies the emergency proving timer in milliseconds. The emergency proving timer marks the amount of time M2PA generates Link Status Proving messages during emergency proving.

Range: 400-5000

Default: 500

:t4n= (optional)

T4N timer. This parameter specifies the normal proving timer in milliseconds. This timer marks the amount of time M2PA generates Link Status Proving messages during normal proving.

Range: 1000-70000

Default: 10000 - D6
30000 - RFC

:t5= (optional)

T5 timer. This parameter specifies the busy rate timer in milliseconds. This timer marks the amount of time between sending Link Status Busy messages while the link is in service.

Range: 80-10000

Default: 1000 - D6
100 - RFC

:t6= (optional)

T6 timer. This parameter specifies the remote congestion timer. This timer marks the amount of time that a congested link will remain in service.

Range: 1000-6000

Default: 3000

:t7= (optional)

T7 timer. This parameter specifies the excessive acknowledgement delay timer. This timer marks the maximum amount of time that can pass between transmission of a user data message and receipt of an acknowledgement for that message from the peer. If this timer expires, the link is taken out of service.

Range: 200-2000

Default: 1200

:ver= (optional)

Version. This parameter specifies the M2PA version used by the association.

Range: d6, rfc

Example

```
chg-m2pa-tset:tset=1:t1=20000
```

```
chg-m2pa-tset:tset=1:t1=20000:ver=d6
```

```
chg-m2pa-tset:srctset=1:tset=2:ver=rfc
```

Dependencies

At least one optional parameter must be specified.

The **srctset** parameter and the **tset** parameter cannot specify the same timer set name.

The specified timer is not supported for the Draft 6 version of M2PA.

Either a timer value or the **srctset** parameter must be specified.

Notes

None

Output

```
chg-m2pa-tset:tset=1:t1=20000:ver=d6
r1ghncxa03w 06-01-18 08:16:14 EST EAGLE 34.3.0
CHG-M2PA-TSET: MASP A - COMPLTD
;
```

chg-map**Change Mate Applications**

Use this command to add or modify an entry in the Mated Application Part (MAP) table. A MAP table entry consists of a mate PC/SSN, its attributes, and an Alternate Routing Indicator Mate MRN Set and MRN point code.

NOTE: A mate point code defines an adjacent signaling point, which is considered the mated signal transfer point (STP) to the system. See the *Notes* section for additional information on multiplicity modes.

NOTE: The GTT Load Sharing with Alternate Routing Indicator (GTT LS ARI) feature must be enabled before an Alternate RI Mate for a MAP Set can be provisioned.

Keyword: chg-map

Related Commands: dlt-map, ent-map, rtrv-map

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

NOTE: The mrnset and mrnpc parameters indicate whether an Alternate RI Mate search is performed in the MRN table if all of the point code/subsystem number combinations provisioned in a given MAP Set are unavailable or congested.

:pc= (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:pc/pca/pci/pcn/pcn24= (mandatory)

Primary remote point code.

:pci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:ssn= (mandatory)

Subsystem number.

Range: 2-255**:eswt=** (optional)

Entity set weight. This parameter specifies the weight assigned to each PC/SSN in a weighted entity set.

This parameter cannot be specified when adding PC/SSNs to a weighted entity set or when modifying RC or weight values for an individual PC/SSN.

Range: 1-99 none

none—Changes a weighted entity set to a non-weighted entity set.

:force= (optional)

The **force=yes** parameter must be specified to modify the **rc** parameter and the **srm**, **mrc**, or **wt** parameter in the same command.

Modification of the **srm**, **mrc**, or **wt** parameter is dependent on the parameter's current multiplicity state, which is dependent on the RC value. Changing the **rc** parameter value can change the multiplicity state, which can then cause the **srm**, **mrc**, or **wt** parameter value to become invalid.

Range: yes

:grp= (optional)

Group. This parameter specifies the concerned point code broadcast list (CSPC) group name. The CSPC is a group of point codes that should be notified of the subsystem status. A different CSPC group can be assigned to each mated PC/SSN. For ANSI, the EAGLE 5 ISS broadcasts SSP or SSA to the mate subsystem only if the mate's point code is provisioned as part of the CSPC group to receive an SSP or SSA.

Range: *ayyyyyyy*

1 alphabetic character followed by up to 7 alphanumeric characters or **none**
none—Disassociates a concerned point code broadcast list group from the given mate application

Default: Current value.

:grpwt= (optional)

Group weight. This parameter specifies the weight assigned to each PC/SSN in a weighted RC group. This parameter cannot be specified when adding PC/SSNs to a weighted entity set or when modifying RC or weight values for an individual PC/SSN.

Range: 1-99

:mapset= (optional)

MAP set ID.

Range: 1-36000 **dflt**

dflt—Default MAP set

Default: **dflt** - If the Flexible GTT Load Sharing feature is not enabled

No change to current value—If the Flexible GTT Load Sharing feature is enabled

:materc= (optional)

Mate relative cost. This parameter specifies the RC assigned to the mate PC/SSN that is being added to the entity set. The EAGLE 5 ISS determines the multiplicity mode based on the RC values (the **rc** and **materc** parameters) of the subsystem.

Range: 0-99

Default: Current value.

:mpc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **mpca**

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

Default: 000-000-000

:mpc/mpca/mpci/mpcn/mpcn24= (optional)

Mate remote point code.

:mpci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—s-
zone—0-7
area—000-255
id—0-7
 The point code **0-000-0** is not a valid point code.

Default: **000-000-000**

:mpcn= (optional)

ITU national point code in the format of a 5-digit ITU number (*nnnnn*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*).

Range: **s-, 0-16383, aa-zz**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—s-
nnnnn—0-16383
gc—aa-zz
m1-m2-m3-m4—0-14 for each member; values must sum to 14

Default: **00000**

:mpcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
msa—000-255
ssa—000-255
sp—000-255

Default: **000-000-000**

:mrc= (optional)

Message routing under congestion. This parameter indicates whether Class 0 messages to the specified PC/SSN can be routed to the next preferred node/subsystem when that PC/SSN is congested.

Range: **yes, no**
yes — Route messages to the mate subsystem when congestion occurs. When congestion subsides, route messages to the primary (dominant) subsystem.
no — send a UDTS indicating that the node/subsystem is in congestion

Default: No change to the current value

:mrnpc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **mrnpca**

Range: **000-255**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

Default: **000-000-000**

:mrnpc\mrnpca\mrnpci\mrnpcn\mrnpcn24= (optional)

Alternate RI Mate point code.

:mrnpci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

Default: **0-000-0**

:mrnpcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

Default: **00000**

:mrnpcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Default: **000-000-000**

:mrnset= (optional)

Alternate RI Mate MRN Set ID. This parameter specifies the MRN Set where the Alternate RI Mate search is performed.

Range: 1-3000 **dflt**

dflt—default MRN Set

If the **mrnpc** parameter is specified, and the **mrnset** parameter is not specified, then the value for the **mrnset** parameter is automatically set to **dflt**.

Default: No change to the current value

:mssn= (optional)

Mated subsystem number. This parameter specifies the SSN that acts as a backup if the SSN fails.

Range: 2-255

Default: Current value.

:mwt= (optional)

Mate point code weight. This parameter specifies the weight assigned to the PC/SSN that is being added to a weighted entity set.

Range: 1-99

:rc= (optional)

Relative cost. This parameter specifies the RC assigned to a specified PC/SSN. The EAGLE 5 ISS determines the multiplicity mode based on the relative costs (the **rc** and **materc** parameters) of the subsystem.

Range: 0-99

Default: Current value.

:srm= (optional)

Subsystem routing messages. This parameter specifies whether subsystem routing messages (SBR, SNR) are transmitted between the mated applications.

This value can be provisioned in any of the multiplicity modes, but its value only affects traffic if the multiplicity mode is *DOM* or *COM*. See the *Notes* section for more information on multiplicity modes.

Range: yes, no

Default: Current value.

:sso= (optional)

Subsystem status option. This parameter specifies whether the PC/SSN will initiate a subsystem test when a RESUME is received for the PC.

Range: on, off

on—prohibited

off—allowed

Default: Primary—no change
Mate, if entered—**off**

:thr= (optional)

Threshold. This parameter specifies the in-service threshold assigned to each PC/SSN in a weighted entity set or RC group.

This parameter cannot be specified when adding PC/SSNs to a weighted entity set or RC group or when modifying RC or weight values for an individual PC/SSN.

If the **thr** parameter is not specified, a value of 1% is assigned to each weighted PC/SSN.

Range: 1-100

:wt= (optional)

Weight. This parameter specifies the new weight assigned to the primary PC/SSN.

Range: 1-99

Example

The following example enters 1-1-3/10 into the MAP table and adds it to the same group as 1-1-0/10. Because 1-1-0/10 already exists in the MAP table, the rc parameter is not used.

chg-map:pc=1-1-0:ssn=10:mpc=1-1-3:mssn=10:materc=40

The following example enters 1-1-2/10 into the MAP table, and adds it to the same group as 1-1-0/10 (see above example). Because 1-1-2/10 has a lower relative cost than 1-1-3/10, it is placed into the group in relative cost order.

chg-map:pc=1-1-0:ssn=10:mpc=1-1-2:mssn=10:materc=30

The following example changes the relative cost (rc) for the specified pc/ssn pair:

chg-map:pc=1-1-0:ssn=10:rc=20

The following example changes the concerned PC broadcast list group name (grp) for the specified pc/ssn pair:

chg-map:pc=1-1-0:ssn=10:grp=abc

The following example changes the ITU-I spare point code entry s-1-12-2 and adds the spare mate point code entry s-2-23-3 in the map table:

chg-map:pci=s-1-12-2:ssn=10:rc=10:mpci=s-2-23-3:mssn=20:materc=10

The following example turns ON the sso option for pc1-1-0 and ssn10.

chg-map:pc=1-1-0:ssn=10:sso=on

The following example turns OFF the sso option for pc1-1-0 and ssn10.

chg-map:pc=1-1-0:ssn=10:sso=off

The following example does not change the current value of the sso option for the primary or the mate.

chg-map:pc=1-1-0:ssn=10:rc=10

The following example turns ON the sso option for primary and mate.

chg-map:pc=1-1-0:ssn=10:mpc=3-3-3:mssn=2:sso=on

The following example turns OFF the sso option for primary and mate.

chg-map:pc=1-1-0:ssn=10:mpc=4-4-4:mssn=2:sso=off

The following example does not change the current value for the sso option for the primary. The sso option is turned OFF for the mate, because the mate is specified but the sso parameter is not specified (the default is OFF for the mate when the mate is specified).

chg-map:pc=1-1-0:ssn=10:mpc=5-5-5:mssn=2

The following example changes the ITU-I spare s-1-12-2 entry and adds the spare mate point code s-2-23-3 entry in the map table.

chg-map:pci=s-1-12-2:ssn=10:rc=10:mpci=s-2-23-3:mssn=20:materc=10

The following example adds a new PC/SSN 1-1-3/10 in the existing MAP set 362.

chg-map:pc=1-1-1:ssn=10:mpc=1-1-3:mssn=10:materc=40:mapset=362

The following example adds a new PC/SSN 1-1-3/15 to the same load-sharing group in the default MAP set to which 1-1-1/15 belongs.

chg-map:pc=1-1-1:ssn=15:mpc=1-1-3:mssn=15:materc=40:mapset=deflt

The following example changes the RC of 1-1-1/10 in existing MAP set 362 to 20.

chg-map:pc=1-1-1:ssn=10:rc=20:mapset=362

The following example changes a non-weighted shared or non-weighted combined entity set to a weighted shared or weighted combined entity set.

```
chg-map:pc=1-1-1:ssn=10:eswt=30
```

The following example changes a non-weighted shared or non-weighted combined entity set to a weighted shared or weighted combined entity set. This example also sets a threshold value and changes the weights of all of the PC/SSNs in the entity set.

```
chg-map:pc=1-1-1:ssn=10:eswt=30:thr=50
```

The following example changes a weighted shared or weighted combined entity set to a non-weighted shared or non-weighted combined entity set.

```
chg-map:pc=1-1-1:ssn=10:eswt=none
```

The following example assigns a weight value to each PC/SSN in an RC group within a weighted entity set.

```
chg-map:pc=1-1-1:ssn=10:grpwt=20
```

The following example assigns a threshold value to each PC/SSN in an RC group within a weighted entity set.

```
chg-map:pc=1-1-1:ssn=10:thr=70
```

The following example assigns weight and threshold values to each PC/SSN in an RC group within a weighted entity set.

```
chg-map:pc=1-1-1:ssn=10:grpwt=20:thr=70
```

The following example changes the weight of an existing PC/SSN in a weighted entity set.

```
chg-map:pc=1-1-1:ssn=10:wt=20
```

The following example changes the weight of PC/SSN 1-1-1/10 and adds PC/SSN 1-2-1/10 to an existing weighted entity set.

```
chg-map:pc=1-1-1:ssn=10:wt=50:mpc=1-2-1:mssn=10:materc=20:mwt=30
```

The following example adds PC/SSN 1-3-2/10 to an existing non-weighted entity set.

```
chg-map:pc=1-1-1:ssn=10:mpc=1-3-2:mssn=10:materc=20:mwt=10
```

The following example changes the RC value and turns on MRC of an existing PC/SSN in a weighted entity set.

```
chg-map:pc=1-1-1:ssn=10:rc=30:mrc=yes:force=yes
```

The following example changes the RC value and turns on SRM of an existing PC/SSN in a weighted entity set.

```
chg-map:pc=1-1-1:ssn=10:rc=30:srm=yes:force=yes
```

The following example changes the RC value and the weight of an existing PC/SSN in a weighted entity set.

```
chg-map:pc=1-1-1:ssn=10:rc=30:wt=20:force=yes
```

The following example changes the Alternate RI Mate (MRNSET and MRNPC) in an existing MAP set.

```
chg-map:mapset=362:pc=1-1-1:ssn=10:mrnset=1:mrnpc=1-1-2
```

Dependencies

At least one optional parameter must be specified.

The specified remote PC must exist in the MAP table.

The Spare Point Code Support feature must be enabled before an ITU-I or ITU-N spare point code can be specified.

The specified SSN must exist for the specified remote PC.

If a subsystem is configured for a subsystem number (SSN) value in the SS-APPL table, then the specified MAP table entry for that subsystem must be a valid point code type for that subsystem. The following point code types are not valid for the indicated subsystems:

- For the INP subsystem, the True Point code cannot be an ITU-I or ANSI point code.
- For the EIR subsystem, the True Point code cannot be an ANSI point code.
- For the AIQ, ATINPQ, or VFLEX subsystem, the True Point code cannot be an ITU-N24 point code.

The mate PC/SSN cannot be the same as the primary PC/SSN.

If the PC value is an ITU type (**pci**, **pcn**, or **pcn24**), the **srn=yes** parameter cannot be specified.

The **apca** and **pcn24** parameters cannot be specified for the same MAP set. The **pci** and **pcn** parameters cannot be specified for the same MAP set if the MAP set contains a true point code.

The ANSI/ITU SCCP Conversion feature must be enabled before the network type of the CPC broadcast group can be different from the network type of the point code.

The mated PC/SSN must not already exist in the MAP table.

The DPCs of the primary subsystem and the mate subsystem must be full PCs.

The format of the **pcn** or **mpcn** parameter must match the format assigned with the **npcfmti** parameter of the **chg-stpopts** command.

If the **mpc** parameter is specified, the **mssn** and **materc** parameters must be specified.

A maximum of 32 mated applications is allowed per MAP set.

The **sso** parameter cannot be specified with a PC that is the system true PC.

A true PC can have only one mate.

A true PC cannot be routed to itself.

If the **mssn** or **materc** parameter is specified, the **mpc** parameter must be specified.

The PC must already exist in the CPC group.

The specified CSPC broadcast list group name must already exist.

If the **mpc** parameter is specified, then the **mssn** parameter must be specified.

The number of MPC Subsystem entries must not exceed the table capacity.

A maximum of 1024 unique remote point codes are allowed.

If a remote MPC is specified, then the remote MPC must exist in the Routing table.

If the Flexible GTT Load Sharing feature is not enabled, then the **mapset** parameter must not be specified. If the Flexible GTT Load Sharing feature is enabled, then the **mapset** parameter must be specified.

The specified MAP set must exist in the database.

The specified PC/SSN/MAP set must already be provisioned in the MAP table.

The EAGLE 5 ISS true PC can be provisioned only in the default MAP set.

The Weighted GTT Loadsharing feature must be turned on before the **wt**, **mwt**, **eswt**, **grpwt**, or **thr** parameters can be specified.

If the **eswt**, **grpwt** or **thr** parameter is specified, the **mpc** parameter cannot be specified.

If the **eswt**, **grpwt** and **thr** parameters are specified, the **rc**, **wt**, **mrc**, **srn**, **sso** or **grp** the parameters cannot be specified.

The **eswt** and **grpwt** parameters cannot be specified together in the command.

If the **eswt=none** parameter is specified, the **thr** parameter cannot be specified.

If the **mwt** parameter is specified, the **mpc** parameter must be specified.

The **mpc** parameter value must be a full point code.

If the **mpc** parameter is specified for a weighted entity set, the **mwt** parameter must be specified.

If the **mpc** parameter is specified for a non-weighted entity set, the **mwt** parameter cannot be specified.

The **eswt=none** parameter cannot be specified for a non-weighted entity set.

The **grpwt** and **thr** parameters cannot be specified for a non-weighted entity set.

If the **chg-sid:pctype=ansi** command is entered, a value of *ni=000* cannot be specified. If the **chg-sid:pctype=ansi** command is entered, and a value of *ni=001 – 005* is specified, a value of *nc=000* cannot be specified

The mate point code in the command will exceed the maximum number of entries in the MAP table.

The MAP table contains the maximum number of possible entries for the specified True Point Code. Maximum entries for the ANSI, ITU-I, and ITU-N point codes are:

- ANSI—2 (ANS41 AIQ and LNP), 3 (ANSI41 AIQ, ATINPQ, and V-FLEX)
- ITU-I—4 (ANSI41 AIQ, ATINPQ, EIR, V-FLEX)
- ITU-N—5 (ANSI41 AIQ, ATINPQ, EIR, INP, and V-FLEX)

NOTE: LNP is mutually exclusive with ATINPQ and V-FLEX

The true point code in the entity set must be the primary PC/SSN for that entity set. The **rc** parameter value for the specified point code cannot be changed, and a new point code cannot be added that causes the true point code to no longer be the primary PC/SSN.

If the **pc** parameter value is a true point code, the subsystem must have a lower RC than all other mated subsystems in the RC group.

If the **mpc** parameter value is a true point code, the subsystem must have a lower RC than all other mated subsystems in the RC group.

The **eswt**, **grpwt**, and **thr** parameters cannot be specified for solitary or dominant entity sets.

The AINPQ, EIR, INP, or V-Flex feature must be turned on or the ANSI41 AIQ or ATINP feature must be enabled before the value specified for the **mpcn** parameter can be a true point code.

The **force=yes** parameter must be specified before the **rc** parameter can be specified in the same command with the **srn**, **mrc**, or **wt** parameter.

The **force** parameter can be used only to specify the **rc** parameter and the **srn**, **mrc**, or **wt** parameter in the same command.

If the **pcn** or **mpcn** parameter is specified, then the format of the parameter must match the format dictated by the **chg-stpopts:npcfnti** command.

D45MPC/MSSN must be defined for given value of MULT.

PC and SSN are not primary applications.

The values specified for the **pc** and **mpc** parameters cannot be associated with proxy point codes.

The EIR or V-Flex feature must be turned on or the ANSI41 AIQ or ATINP feature must be enabled before the value specified for the **mpci** parameter can be a true point code.

The LNP or V-Flex feature must be turned on or the ANSI41 AIQ or ATINP feature must be enabled before the value specified for the **mpca** parameter can be a true point code.

The GTT LS ARI feature must be enabled before the **mrnset** and **mrnpc** parameters can be specified.

The value specified for the **mrnpc** parameter must be a full point code.

The value specified for the **mrnset** parameter must already exist in the MRN table.

The point codes and alternate RI Mate point codes must have compatible network types as shown:

- ITUI, ITU-N, ITU-I spare, ITU-N-spare—ITUI, ITU-N, ITU-I spare, ITU-N-spare
- ANSI—ANSI
- ITUN-24—ITUN-24

The value specified for the **mrnpc** parameter must already exist in the specified MRN Set.

If the **mrnset** parameter is specified, then the **mrnpc**, **mrnpca**, **mrnpci**, **mrnpcn**, or **mrnpc24** parameter must be specified.

If the **eswt**, **grpwt**, or **thr** parameter is specified, then the **mrnpc** parameter cannot be specified.

The **mrnset** parameter cannot be specified if the MAP Set specified by the **mapset** parameter contains a True Point Code.

Notes

When the ANSI/ITU SCCP Conversion feature is enabled, the Concerned Point Code (CSPC) Group's network type can be of a different network than the mated application's network type. For example, the mated application's network type could be ANSI and the CSPC Group could be ITU or mixed with ANSI, ITU, and ITUN concerned point codes.

Multiplicity Modes

For the **-map** commands, an entity set consists of a group of PC/SSNs that are used for traffic distribution, and an RC group consists of PC/SSNs within an entity set that have the same RC. In *loadsharing* mode, an entity set contains 1 RC group. In combined *loadsharing/dominant* mode, an entity set can contain multiple loadsharing groups.

NOTE: For *dominant* and *combined loadsharing/dominant* modes, the PC/SSN in the MAP table where traffic distribution initializes is determined by the result of GTT translation and is referred to as the preferred PC/SSN. The preferred PC/SSN may not be the lowest cost entry.

The EAGLE 5 ISS supports the following multiplicity modes for nodes/subsystems:

- When a PC/SSN pair is not replicated, the pair is in *solitary* (SOL) mode. The subsystem acts as the only application, with no backup. If this subsystem fails, messages routed to it are discarded and SCCP management returns "Subsystem Unavailable" messages to the originator.
- A group of replicated PC/SSN pairs are in *dominant* (DOM) mode if each PC/SSN pair in the group has a unique RC. The preferred PC/SSN acts as the primary subsystem, while the higher cost systems act as backups.
- A group of replicated PC/SSN pairs are in *load sharing* (SHR) mode if each PC/SSN pair in the group has the same RC. All messages are evenly distributed at the SCCP level to all nodes/subsystems in the group. If failure occurs, the non-affected subsystem assumes the load of its failed mate.
- The *combined loadsharing/dominant* (COM) mode supports a combination of load sharing and dominant mode. A group of PC/SSN pairs are in COM mode when at least two of the PC/SSN pairs have the same RC and another node subsystem in the group has a different RC.

The **sso** parameter changes the initialization of the subsystem status (“prohibited” or “allowed”) for PC/SSN MAP entries. The EAGLE 5 ISS previously marked the subsystem status “allowed” (OFF) for each PC/SSN entry. The **sso** option marks the subsystem status “prohibited” for each entry that has **sso=on**. This causes the EAGLE 5 ISS to generate an SST to the remote PC when an MTP-RESUME is received. Upon reception of an SSA, the subsystem status is marked “allowed”.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

When the Flexible GTT Load Sharing feature is turned on, MAP Load-Sharing Sets are supported. Each MAP set is identified by a new **mapset** parameter.

When the Weighted GTT Loadsharing feature is turned on, weighted entity sets and RC groups are supported, and threshold values can be assigned to each PC/SSN in a weighted entity set.

Output

```
chg-map:pc=1-1-0:ssn=10:mpc=1-1-3:mssn=10:materc=40:mapset=362

chg-meas

Change Measurements

Use this command to change both the report and collecting status of the EOAM based measurement subsystem.

NOTE: After the Measurements Platform collection function has been enabled, the collect=on/off parameter controls only the output of reports to the UI. The parameter has no effect on enabling and disabling collection and report generation for the Measurements Platform. Report generation for the Measurements Platform is controlled by the rept-ftp-meas and chg-measopts commands.

Keyword: chg-meas

Related Commands: copy-meas, rept-ftp-meas, rept-meas, rtrv-meas-sched

Command Class: Link Maintenance

Parameters

:collect= (optional)

Activates or deactivates the reporting of scheduled measurements to the UI. This parameter does not affect measurements collection and generation for the Measurements Platform.

Range: on, off

Default: No change to value

System

Default: off - off

:complink= (optional)

Activates or deactivates scheduled measurement report for links.

Range: on, off
Default: Current value

:complnkset= (optional)
 Activates or deactivates scheduled measurement report for linksets.

Range: on, off
Default: Current value

:gtwylnkset= (optional)
 Activates or deactivates the scheduled GTWY measurement report for the linkset.

Range: on, off
Default: Current value

:gtwylsfltr= (optional)
 Filters the linksets included in the GTWY report.

Range: both, stp, seas, none
both—Only gateway linksets are included in the report to the terminal and SEAS.
stp—Only gateway linksets are included in the report to the terminal. All defined linksets are included in the report to SEAS.
seas—All defined linksets are included in the report to the terminal. Only gateway linksets are included in the report to SEAS.
none—All defined linksets are included in the report to the terminal and SEAS.

:gtwystp= (optional)
 Activates or deactivates the scheduled GTWY measurement report for the STP.

Range: on, off
Default: Current value

:systotstp= (optional)
 Activates or deactivates scheduled measurement report for STP system totals.

Range: on, off
Default: Current value

:systotstplan= (optional)
 Activates or deactivates scheduled measurement report for the STPLAN feature system totals.

Range: on, off
Default: Current value

:systottt= (optional)
 Activates or deactivates scheduled measurement report for translation type system totals.

Range: on, off
Default: Current value

Example

```
chg-meas:collect=on
chg-
meas:complnk=on:complnkset=on:systottt=off:systotstp=off:collect
=on
chg-meas:gtwylsfltr=both
```

Dependencies

At least one optional parameter must be specified.

If the 15 Minute Measurements and Measurements Platform collection functions are provisioned (see the **chg-measopts** command), then the **collect=on** parameter cannot be specified.

If there are no configured links, then the **collect=on** parameter cannot be specified.

If the Integrated Measurements feature is turned on and the link count exceeds 700 links, then the **systotstp=on**, **systottt=on**, **systotstplan=on**, **complnkset=on**, **complink=on**, **gtwystp=on**, or **gtwylnkset=on** parameter cannot be specified.

Notes

Activated scheduled reports print at serial ports configured for traffic-related unsolicited messages (the **traf=yes** parameter of the **chg-trm** command).

When the Measurements Platform is not enabled, the daily maintenance scheduled reports are always allowed and cannot be inhibited.

The *Maintenance Manual* provides detailed information on measurements and measurement reports.

Output

```
chg-
meas: complink=on: complnkset=on: systottt=off: systotstp=off: collect
=on

rlghncxa03w 04-01-18 17:02:57 EST EAGLE 31.3.0
CHG-MEAS: MASP A - COMPLTD
;
```

chg-measopts

Change Measurements Options

Use this command to:

- turn on the collection function for Integrated Measurements and Measurements Platform,
- turn the collection function for 15 Minute Measurements on or off
- turn the CLLI-based file name option for measurements reports files on or off
- activate or de-activate automatic generation and FTP transfer of scheduled measurements reports to the FTP server

NOTE: After the Measurements Platform or Integrated Measurements collection function has been enabled, it cannot be disabled with this command.

NOTE: As of Release 42.0, the hourly and daily maintenance report controls are only available in the **chg-mtc-measopts** command. The affected reports are: **mtcdlink**, **mtcdlnkset**, **mtcdstp**, **mtcdstplan**, **mtcdlnp**, **mtcdnp**, **mtcdmap**, **mtcdsetpasoc**, **mtcdsetpcard**, **mtcdua**, **mtcdeir**, **mtchlnp**, **mtchnp**, **mtchmap**, and **mtcheir**.

Keyword: **chg-measopts**

Related Commands: **chg-ftp-serv**, **chg-meas**, **chg-mtc-measopts**, **chg-netopts**, **dlt-ftp-serv**, **ent-ftp-serv**, **rept-ftp-meas**, **rept-meas**, **rept-stat-meas**, **rtrv-ftp-serv**, **rtrv-measopts**, **rtrv-mtc-measopts**, **rtrv-netopts**

Command Class: Link Maintenance

Parameters

NOTE: As of Release 44.0, the **all**, **avldlink**, **avllink**, **avlstplan**, **cllibasedname**, **collect15min**, **complink**, **complnkset**, **compsetpasoc**, **compsetpcard**, **compua**, **gtwylnkset**, **gtwylsdestni**, **gtwylsonismt**, **gtwylsorigni**, **gtwylorigni**, **gtwylorigninc**, **gtwystp**, **nmlink**, **nmlnkset**, **nmstp**,

systotstp, systotstplan, and systotstt parameters can be set using the individual parameters or as options for the on and off parameters.

NOTE: The options for the on and off parameters are described in the Notes section.

:all= (optional)

Activates or deactivates the automatic generation and FTP transfer of all scheduled measurements reports.

NOTE: The all parameter does not change the setting of the platformenable, cllibasedname, collect15min and oamhcmeas parameters.

Range: on, off

Default: No change to the current value

:avldlink= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled daily availability measurement report for links.

Range: on, off

Default: No change to the current value

System

Default: off

:avlink= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled hourly availability measurement report for links.

Range: on, off

Default: No change to the current value

System

Default: off

:avlstplan= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled hourly availability measurement report for STPLAN.

Range: on, off

Default: No change to the current value

System

Default: off

:cllibasedname= (optional)

Enable or disable CLLI-based measurements report file name option.

Range: on, off

Default: No change to the current value

System

Default: off

:collect15min= (optional)

Turns on or off the 15 Minute Measurements collection function.

Range: on, off

Default: No change to the current value

System

Default: off

:complink= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled component measurement report for links.

Range: on, off

Default: No change to the current value

System

Default: off

:complnkset= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled component measurement report for linksets.

Range: on, off

Default: No change to the current value

System

Default: off

:compsctpasoc= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled component measurement report for per association SCTP data.

Range: on, off

Default: No change to the current value

:compsctpcard= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled component measurement report for per card SCTP data.

Range: on, off

Default: No change to the current value

:compua= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled component measurement report for M3UA and SUA application server/association pairs.

Range: on, off

Default: No change to the current value

:gtwylnkset= (optional)

Activates or deactivates the automatic generation and FTP transfer of scheduled GTWY measurement report for linksets.

Range: on, off

Default: No change to the current value

System

Default: off

:gtwylsdestni= (optional)

Activates or deactivates the automatic generation and FTP transfer of scheduled GTWY link set measurement report for destination NI

Range: on, off

Default: No change to the current value

System

Default: off

:gtwylsonismt= (optional)

Activates or deactivates the automatic generation and FTP transfer of scheduled GTWY linkset measurement report for ISUP message type per linkset per originating NI

Range: on, off

Default: No change to the current value

System

Default: off

:gtwylsorigni= (optional)

Activates or deactivates the automatic generation and FTP transfer of scheduled GTWY link set measurement report for originating NI

Range: on, off

Default: No change to the current value

System

Default: off

:gtwyorigni= (optional)

Activates or deactivates the automatic generation and FTP transfer of scheduled GTWY link measurement report for originating NI.

Range: on, off

Default: No change to the current value

System

Default: off

:gtwyorigninc= (optional)

Activates or deactivates the automatic generation and FTP transfer of scheduled GTWY link measurement report for originating NI and NC.

Range: on, off

Default: No change to the current value

System

Default: off

:gtwystp= (optional)

Activates or deactivates the automatic generation and FTP transfer of scheduled GTWY measurement report for STP.

Range: on, off

Default: No change to the current value

System

Default: off

:nmlink= (optional)

Activates or deactivates automatic generation and FTP transfer of the scheduled network management measurement report for links.

Range: on, off

Default: No change to the current value

System

Default: off

:nmlnkset= (optional)

Activates or deactivates automatic generation and FTP transfer of the scheduled network management measurement report for link sets.

Range: on, off

Default: No change to the current value

System

Default: off

:nmstp= (optional)

Activates or deactivates automatic generation and FTP transfer of scheduled network management measurement report for STP.

Range: on, off

Default: No change to the current value

System

Default: off

:oamhcmeas= (optional)

Turns on the Integrated Measurements collection function on the E5-OAM card.
This function cannot be turned off after it has been turned on.

Range: on

Default: No change to the current value.

System

Default: off

:off= (optional)

This parameter turns off the specified options. Up to 8 comma-separated unique options can be specified.

Range: systotidpr, all, avldlink, avllink, avlstplan, cllibasedname, collect15min, complink, complnkset, compcspasoc, compcspcard, compua, gtwylnkset, gtwylsdestni, gtwylnsonismt, gtwylsorigni, gtwyorigni, gtwyorigninc, gtwystp, nmlink, nmlnkset, nmstp, systotstp, systotstplan, systottt

:on= (optional)

This parameter turns on the specified options. Up to 8 comma-separated unique options can be specified.

Range: systotidpr, all, avldlink, avllink, avlstplan, cllibasedname, collect15min, complink, complnkset, compcspasoc, compcspcard, compua, gtwylnkset, gtwylsdestni, gtwylnsonismt, gtwylsorigni, gtwyorigni, gtwyorigninc, gtwystp, nmlink, nmlnkset, nmstp, oamhcmeas, platformenable, systotstp, systotstplan, systottt

:platformenable= (optional)

Turns on the Measurements Platform collection function.
This parameter cannot be turned off after it has been turned on.

Range: on

Default: No change to the current value

System

Default: off

:systotstp= (optional)

Activates or deactivates automatic generation and FTP transfer of scheduled measurement report for STP system totals.

Range: on, off

Default: No change to the current value

System

Default: off

:systotstplan= (optional)

Activates or deactivates automatic generation and FTP transfer of the scheduled measurement report for the STPLAN feature system totals.

Range: on, off

Default: No change to the current value

System

Default: off

:systottt= (optional)

Activates or deactivates automatic generation and FTP transfer of scheduled measurement report for translation type system totals.

Range: on, off

Default: No change to the current value

System
Default: off

Example

```
chg-measopts:platformenable=on
chg-
measopts:platformenable=on:complink=on:complnkset=on:systotstt=off
:systotstp=off
chg-
measopts:on=complink,complnkset,systotstt,systotidpr:off=gtwylsoni
smt,compua,nmlink,nmstp
```

Dependencies

The Measurements Platform feature must be turned on before the **platformenable=on** parameter can be specified.

An MCPM card must be in the IS-ANR Restrict state before the Measurements Platform collection option can be enabled.

The 15 Minute Measurements feature must be enabled and turned on before the 15 Minute Measurements collection option can be turned on.

The **platformenable=on** or **oamhcmeas=on** parameter must be specified before the **cllibasedname=on** parameter can be specified.

This command is not allowed while in upgrade mode.

Half-hour collection and report processing cannot be in progress when **collect15min=on** is specified.

Quarter-hour collection and report processing cannot be in progress when **collect15min=off** is specified.

At least one configured link must exist before the **platformenable=on** or **oamhcmeas=on** parameter can be specified.

The **oamhcmeas** or **platformenable** parameter cannot be specified if an OAM/OAMHC to MCP/MCPHC or MCP/MCPHC to OAMHC transition is in progress.

The Integrated Measurements feature must be turned on before the **oamhcmeas=on** parameter can be specified.

The Integrated Measurements or Measurements Platform feature must be turned on before this command can be entered.

The **platformenable** and **oamhcmeas** parameters cannot be specified together in the command.

The same option cannot be specified for the **on** and **off** parameters in the same command.

Parameters cannot be specified individually and as options for the **on** or **off** parameter in the same command.

Notes

Activated scheduled reports are generated and transferred to the customer's FTP server.

The **rept-ftp-meas** command can be used to manually generate and transfer one report at a time as needed.

The primary application of the **set-time** command is for Daylight Savings Time changes, setting the time forward or backward 1 hour. To reduce effects of **set-time** changes on measurements, the time change should be done within the first 15 minutes of any hour.

The *Maintenance Manual* provides detailed information on measurements and measurement reports.

CLLI-Based Measurements Report File Name

When the CLLI-based file name option (**cllibasedname**) is turned on, the CLLI is added to the measurements report file name, and the year is removed from the file name to ensure that the file name is equal to or fewer than 39 characters.

15 Minute Measurements

When the SEAS feature is turned on and 15 Minute Measurements collection is turned from off to on with the **collect15min=on** parameter, the message "Disabling SEAS Measurements..." is displayed at the UI.

When the SEAS feature is turned on and 15 Minute Measurements collection is running (**collect15min=on**), EAGLE 5 ISS measurements output to the SEAS interface is disabled.

When the SEAS feature is turned on and 15 Minute Measurements collection is turned from on to off with the **collect15min=off** parameter, EAGLE 5 ISS measurements output to the SEAS interface is enabled again.

NOTE: If SEAS reporting is turned on, for the 24 hours after the 15 Minute Measurements option is turned from on to off, 30-minute demand SEAS reports for time periods prior to the option status change will contain only 15 minutes of data, and SEAS will not support reporting at the xx15 and xx45 times.

Some quarter-hour measurements data might not be available for 24 hours after turning 15 Minute Measurements collection on. This condition exists for quarter-hour intervals for which 15 Minute Measurements collection has not yet occurred. Data that was collected on a 30-minute basis is available for reporting for up to 24 hours after it is collected. After the 15 Minute Measurements collection option is turned on, this data remains available on a half-hour basis (xx00 and xx30) but is not available on a quarter-hour basis (xx15 and xx45) because no data was collected on the quarter hours. After the 15 Minute Measurements collection option has been turned on for 24 hours, all 15-minute measurements data is available on a quarter-hour basis (xx00, xx15, xx30, and xx45).

In addition, full 30-minute data coverage will not be available until 24 hours after turning off the 15 Minute Measurements collection option. Reports for specific periods will always contain the amount of data collected for that period.

The action of turning 15-minute measurements feature control status on using the **chg-ctrl-feat** command also has an impact on the generation of measurements reports for **period=active**. Specifically, if the feature control status of 15-minute measurements is turned on and a report is requested for the active interval prior to the next scheduled measurements collection (based on the current 15-minute measurements status), the starting time for the period shown in the report will be incorrect. As soon as the next scheduled collection occurs, active reports will show the correct starting time. For example, if 15-minute feature control status is turned on with the **chg-ctrl-feat** command at 13:03, and the 15-minute measurements collection option is turned on using the **chg-measopts** command at 13:05, and a comp-link report for **period=active** is requested at 13:10, that report will contain an incorrect interval start time. If the same report is requested at 13:20, the start time shown in the report will be correct, because a collection occurred at 13:15.

A similar limitation exists for **period=last**. If the feature control status of 15-minute measurements is turned on and a report is requested for the last interval prior to the next scheduled measurements collection (based on the current 15-minute measurements status), the start and end times for the period shown in the report will be incorrect. The data presented in the report will correspond to the start and end times. As soon as the next scheduled collection occurs, then **period=last** reports will show the correct start and end times and the corresponding data for that interval. To generate measurements from the last collected interval before the first collection with feature control status on, a **period=specific** report will need to be entered. In the example given in the previous paragraph, the first report requested at 13:10 would not give the last interval, but the data given would correspond to the interval shown in the report. The second report requested at 13:20 would show correct start and end times and the data would correspond to the interval.

If the 15 Minute Measurements collection option is turned from on to off in the first 15 minutes of a half-hour (xx00-xx15 or xx30-xx45) and a demand report is requested in the second 15 minutes of a half-hour (xx15-xx30 or xx45-xx60) for **period=last** or **period** not specified, the report that is displayed will be the last 15-minute interval (xx00-xx15 or xx30-xx45), not the last collected 15-minute interval (xx45-xx00 or xx15-xx30). Collection did not occur during this 15-minute period, and the message “Measurements data not current” will be displayed. To report the last collected 15-minute interval, **period=specific** must be specified in the command with the correct **qh/hh** value.

The time interval in each measurements report shows which collection option was on when the measurements were collected. (This might not be the option that is currently on if the option was changed in the last 24 hours).

- xx00-xx15—None. 15 minutes of data will be collected for the quarter-hour xx15.
- xx15-xx30—The xx15 interval will contain no data. The xx30 interval will contain 30 minutes of data.
- xx30-xx45—None. 15 minutes of data will be collected for the quarter-hour xx15.
- xx45-xx00—The xx45 interval will contain no data. The xx00 interval will contain 30 minutes of data.

on/off options

- **all**—Allows automatic generation and FTP transfer of all scheduled measurements reports. If the 15 Minute Measurements feature is turned on and the **collect15min** parameter is specified, then scheduled reports on FTP can be generated every 15 minutes. This parameter does not change the setting of the **platformenable**, **cllibasedname**, **collect15min**, and **oamhcmear** parameters. This option has a default of OFF
- **avldlink**—Allows automatic generation and FTP transfer of the scheduled daily availability measurement report for links. If the 15 Minute Measurements feature is turned on and the **collect15min** parameter is specified, then scheduled reports on FTP can be generated every 15 minutes. This option has a default of OFF.
- **avllink**—Allows automatic generation and FTP transfer of the scheduled hourly availability measurement report for links. If the 15 Minute Measurements feature is turned on and the **collect15min** parameter is specified, then scheduled reports on FTP can be generated every 15 minutes. This option has a default of OFF.
- **avlstplan**—Allows automatic generation and FTP transfer of the scheduled hourly availability measurement report for STPLAN. If the 15 Minute Measurements feature is turned on and the **collect15min** parameter is specified, then scheduled reports on FTP can be generated every 15 minutes. This option has a default of OFF.
- **cllibasedname**—CLLI-based measurements report file name option. This option has a default of OFF.
- **collect15min**—15 Minute Measurements collection function. This option has a default of OFF.
- **complink**—Allows automatic generation and FTP transfer of the scheduled component measurement report for links. If the 15 Minute Measurements feature is turned on and the **collect15min** parameter is specified, then scheduled reports on FTP can be generated every 15 minutes. This option has a default of OFF.
- **complnkset**—Allows automatic generation and FTP transfer of the scheduled component measurement report for linksets. If the 15 Minute Measurements feature is turned on and the

- collect15min** parameter is specified, then scheduled reports on FTP can be generated every 15 minutes. This option has a default of OFF.
- **compsectpasoc**—Allows automatic generation and FTP transfer of the scheduled component measurement report for per association SCTP data. If the 15 Minute Measurements feature is turned on and the **collect15min** parameter is specified, then scheduled reports on FTP can be generated every 15 minutes. This option has a default of OFF.
 - **compsectpcard**—Allows automatic generation and FTP transfer of the scheduled component measurement report for per card SCTP data. If the 15 Minute Measurements feature is turned on and the **collect15min** parameter is specified, then scheduled reports on FTP can be generated every 15 minutes. This option has a default of OFF.
 - **compua**—Allows automatic generation and FTP transfer of the scheduled component measurement report for M3UA and SUA application server/association pairs. If the 15 Minute Measurements feature is turned on and the **collect15min** parameter is specified, then scheduled reports on FTP can be generated every 15 minutes. This option has a default of OFF.
 - **gtwylnkset**—Allows automatic generation and FTP transfer of scheduled GTWY measurement report for linksets. If the 15 Minute Measurements feature is turned on and the **collect15min** parameter is specified, then scheduled reports on FTP can be generated every 15 minutes. This option has a default of OFF.
 - **gtwylsdestni**—Allows automatic generation and FTP transfer of scheduled GTWY link set measurement report for destination NI. If the 15 Minute Measurements feature is turned on and the **collect15min** parameter is specified, then scheduled reports on FTP can be generated every 15 minutes. This option has a default of OFF.
 - **gtwylsonismt**—Allows automatic generation and FTP transfer of scheduled GTWY linkset measurement report for ISUP message type per linkset per originating NI. If the 15 Minute Measurements feature is turned on and the **collect15min** parameter is specified, then scheduled reports on FTP can be generated every 15 minutes. This option has a default of OFF.
 - **gtwylsorigni**—Allows automatic generation and FTP transfer of scheduled GTWY link set measurement report for originating NI. If the 15 Minute Measurements feature is turned on and the **collect15min** parameter is specified, then scheduled reports on FTP can be generated every 15 minutes. This option has a default of OFF.
 - **gtwyorigni**—Allows automatic generation and FTP transfer of scheduled GTWY link measurement report for originating NI. If the 15 Minute Measurements feature is turned on and the **collect15min** parameter is specified, then scheduled reports on FTP can be generated every 15 minutes. This option has a default of OFF.
 - **gtwyorigninc**—Allows automatic generation and FTP transfer of scheduled GTWY link measurement report for originating NI and NC. If the 15 Minute Measurements feature is turned on and the **collect15min** parameter is specified, then scheduled reports on FTP can be generated every 15 minutes. This option has a default of OFF.
 - **gtwystp**—Allows automatic generation and FTP transfer of scheduled GTWY measurement report for STP. If the 15 Minute Measurements feature is turned on and the **collect15min** parameter is specified, then scheduled reports on FTP can be generated every 15 minutes. This option has a default of OFF.
 - **nmlink**—Allows automatic generation and FTP transfer of the scheduled network management measurement report for links. This option has a default of OFF.
 - **nmlnkset**—Allows automatic generation and FTP transfer of the scheduled network management measurement report for link sets. This option has a default of OFF.

- **nmstp**—Allows automatic generation and FTP transfer of scheduled network management measurement report for STP. This option has a default of OFF.
- **oamhcmeas**—Turns ON the Integrated Measurements collection function on the E5-OAM card. This option cannot be turned OFF.
- **platformenable**—Turns ON the Measurements Platform collection function. This option cannot be turned OFF.
- **systotidpr**—Allows scheduled reports for IDPR Measurement Pegs on FTP to be generated every 30 minutes. If the 15 Minute Measurements feature is turned on and the **collect15min** parameter is specified, then scheduled reports on FTP can be generated every 15 minutes. This option has a default of OFF.
- **systotstp**—Allows automatic generation and FTP transfer of scheduled measurement report for STP system totals. If the 15 Minute Measurements feature is turned on and the **collect15min** parameter is specified, then scheduled reports on FTP can be generated every 15 minutes. This option has a default of OFF.
- **systotstplan**—Allows automatic generation and FTP transfer of the scheduled measurement report for the STPLAN feature system totals. If the 15 Minute Measurements feature is turned on and the **collect15min** parameter is specified, then scheduled reports on FTP can be generated every 15 minutes. This option has a default of OFF.
- **systottt**—Allows automatic generation and FTP transfer of scheduled measurement report for translation type system totals. If the 15 Minute Measurements feature is turned on and the **collect15min** parameter is specified, then scheduled reports on FTP can be generated every 15 minutes. This option has a default of OFF.

chg-mrn

Change Mated Relay Node

Use this command to add new point codes, modify existing point codes and relative costs, and add or modify Alternate RI Mate data in the Mated Relay Node (MRN) table. The Intermediate GTT Load-Sharing (IGTTLS) feature must be on to enter this command. The GTT Load Sharing with Alternate Routing Indicator Feature (GTT LS ARI) must be enabled to provision an Alternate RI Mate.

If the IGTTLS feature is on, and the Flexible GTT Load Sharing feature (FGTTLS) is enabled, then entries are added to or changed in existing MRN sets in the MRN table.

If the IGTTLS feature is on, and the FGTTLS feature is not enabled, then the MRN table can contain a maximum of 3000 entries. If both the IGTTLS and FGTTLS features are on, then the MRN table can contain a maximum of 6000 entries.

CAUTION: If any entries are provisioned in the SCCP-SERV table, the maximum number of entries that the MRN table can contain is reduced by that amount. Enter the `rtrv-sccp-serv` command output to see if entries exist in the SCCP-SERV table. See the Notes section for additional information on multiplicity modes.

Keyword: `chg-mrn`

Related Commands: `dlt-mrn`, `ent-mrn`, `rtrv-mrn`

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

NOTE: The `mapset`, `mappc`, and `mapssn` parameters indicate whether an Alternate RI Mate search is performed in the MAP table if all PCs provisioned in a given MRN Set are unavailable or congested.

:pc= (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: `pca`

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, `ni = 000` is not valid.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is not valid if `ni = 001-005`.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is valid if `ni = 006-255`.

The point code `000-000-000` is not a valid point code.

:pc/pca/pci/pcn/pcn24= (mandatory)

Post-GTT-translated point code.

:pci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code `0-000-0` is not a valid point code.

:pcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmti` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

*n**n**n**n*—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:eswt= (optional)

Entity set weight. This parameter specifies the weight assigned to each PC in a weighted entity set. This parameter cannot be specified when adding PCs to a weighted entity set or when modifying RC or weight values for an individual PC.

Range: 1-99 none

none—Changes a weighted entity set to a non-weighted entity set.

:force= (optional)

The **force=yes** parameter must be specified to modify the **rc**, **rc1**, **rc2**, **rc3**, or **rc4** parameter and the **wt**, **wt1**, **wt2**, **wt3**, or **wt4** parameter in the same command.

Modification of the **wt**, **wt1**, **wt2**, **wt3**, or **wt4** parameters is dependent on the parameter's current multiplicity state, which is dependent on the RC value. Changing the **rc** parameter value can change the multiplicity state, which can then cause any of the weight parameter values to become invalid.

Range: yes**:grpwt=** (optional)

Group weight. This parameter specifies the weight assigned to each PC in a weighted RC group.

This parameter cannot be specified when adding PCs to a weighted entity set or when modifying RC or weight values for an individual PC.

Range: 1-99**:mappc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-nm)*.

Synonym: mappca**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

Default: 000-000-000

:mappc\mappca\mappci\mappcn\mappcn24= (optional)

Alternate RI Mate point code.

:mappci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

Default: 0-000-0

:mappcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfmt** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

Default: 00000

:mappcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

Default: 000-000-000

:mapset= (optional)

Alternate RI Mate MAP Set ID. This parameter specifies the MAP set where Alternate Routing Indicator searches are performed.

Range: 1-36000 dflt

dflt—Default MAP Set

If the **mappc** and **mapssn** parameters are specified, and the **mapset** parameter is not specified, then the **mapset** parameter is automatically set to a value of **dflt**.

Default: No change to the current value

:mapssn= (optional)

Alternate RI Mate Subsystem Number. This parameter specifies the subsystem number that is used for the Alternate Routing Indicator search.

Range: 2-255 *, none

If the **mapssn=*** parameter is specified, then the values specified for the **mapset** and **mappc** parameters must already exist in the MAP table.

Default: No change to the current value

:mrnset= (optional)

MRN set ID.

Range: 1-3000 dflt

dflt—Default MRN set.

:pc1= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca1

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

:pc1/pca1/pci1/pcn1/pcn241= (optional)

Alternate post-GTT-translated point code.

:pc2= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca2

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

:pc2/pca2/pci2/pcn2/pcn242= (optional)

Alternate post-GTT-translated point code.

:pc3= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca3

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

:pc3/pca3/pci3/pcn3/pcn243= (optional)

Alternate post-GTT-translated point code.

:pc4= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca4

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

:pc4/pca4/pci4/pcn4/pcn244= (optional)

Alternate post-GTT-translated point code.

:pci1= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pci2= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pci3= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pci4= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pcn1= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn2= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn241= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:pcn243= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:pcn244= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:pcn3= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn4= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:rc= (optional)

Relative cost. This parameter specifies the relative cost of the route for the primary PC.

Range: 0-99

:rc1= (optional)

Relative cost 1. This parameter specifies the relative cost of the route for mate PC 1.

Range: 0-99

:rc2= (optional)

Relative cost 2. This parameter specifies the relative cost of the route for mate PC 2.

Range: 0-99

:rc3= (optional)

Relative cost 3. This parameter specifies the relative cost of the route for mate PC 3.

Range: 0-99

:rc4= (optional)

Relative cost 4. This parameter specifies the relative cost of the route for mate PC 4.

Range: 0-99

:thr= (optional)

Threshold. This parameter specifies the in-service threshold of all PCs in a weighted entity set or RC group.

This parameter cannot be specified when adding PCs to a weighted entity set or RC group or when modifying RC or weight values for an individual PC.

If the **thr** parameter is not specified, a value of 1% is assigned to each weighted PC.

Range: 1-100

:wt= (optional)

Weight. This parameter specifies the new weight assigned to the primary PC.

This parameter cannot be specified when adding PCs to a weighted entity set.

Range: 1-99

:wt1= (optional)

Weight 1. This parameter specifies the weight assigned to the mate PC 1 that is being added to the weighted entity set.

Range: 1-99

:wt2= (optional)

Weight 2. This parameter specifies the weight assigned to the mate PC 2 that is being added to the weighted entity set.

Range: 1-99

:wt3= (optional)

Weight 3. This parameter specifies the weight assigned to the mate PC 3 that is being added to the weighted entity set.

Range: 1-99

:wt4= (optional)

Weight 4. This parameter specifies the weight assigned to the mate PC 4 that is being added to the weighted entity set.

Range: 1-99

Example

In the following example, the system searches the MRN table for a point code of 1-1-0. If the point code is found, its relative cost is set to 40.

chg-mrn:pc=1-1-0:rc=40

In the following example, the system searches the MRN table for point code 1-1-0. Having found it, the system then searches the entity set for 1-1-10. If 1-1-10 is not in the entity set, the command will add point code 1-1-10 to the entity set and assign it a relative cost of 30.

chg-mrn:pc=1-1-0:pc1=1-1-10:rc1=30

In the following example, the system searches the MRN table for a point code of 1-1-0. Having found it, the system then searches for each of the two specified associated point codes in the entity set. If neither of the associated point codes are found, the specified point codes and their relative costs are inserted into the entity set in the MRN table.

chg-mrn:pc=1-1-0:pc1=1-1-1:rc1=10:pc2=1-1-10:rc2=20

The following examples include spare point codes.

chg-mrn:pcn=s-1-1-1-123-aa:rc=1:pcn1=s-1-1-1-235-aa:rc1=2:pcn2=s-1-1-1-235-aa:rc2=3

chg-

mrn:pci=s-2-2-1:rc=20:pci1=s-2-2-2:rc1=21:pci2=s-2-100-1:rc2=22

chg-mrn:pc=1-1-1:rc=30:mrnset=df1t

chg-mrn:pc=1-1-1:rc=20:pc1=2-2-2:rc1=20:mrnset=111

chg-mrn:pc=1-1-1:pc1=3-3-3:rc1=30:mrnset=111

The following examples change a non-weighted entity set to a weighted entity set.

chg-mrn:pc=1-1-1:eswt=30

chg-mrn:pc=1-1-1:eswt=30:thr=50

The following example changes a weighted entity set to a non-weighted entity set.

chg-mrn:pc=1-1-1:eswt=none

The following example assigns a weight value to each PC in a weighted RC group within a weighted entity set.

```
chg-mrn:pc=1-1-1:grpwt=20
```

The following example assigns a threshold value to each PC in the RC group within a weighted entity set.

```
chg-mrn:pc=1-1-1:thr=70
```

The following example assigns a weight and threshold to each PC in an RC group within a weighted entity set.

```
chg-mrn:pc=1-1-1:grpwt=20:thr=70
```

The following example assigns PC 1-1-1 a weight of 30.

```
chg-mrn:pc=1-1-1:wt=30
```

The following example adds PC 1-1-10 to the weighted entity set containing PC 1-1-0 and assigns PC 1-1-10 an RC of 30 and a weight of 20.

```
chg-mrn:pc=1-1-0:pc1=1-1-10:rc1=30:wt1=20
```

The following example assigns specified PCs and their associated RCs and weights to the weighted entity set that contains the point code 1-1-0.

```
chg-mrn:pc=1-1-0:pc1=1-1-1:rc1=10:wt1=35:pc2=1-1-10:rc2=20:wt2=20
```

The following example modifies both RC values and weights for PCs in an existing weighted entity set.

```
chg-  
mrn:pc=1-1-0:rc=30:wt=10:pc1=1-1-10:rc1=20:pc2=1-1-2:wt2=5:force=  
yes
```

The following example modifies only weights for PCs in an existing weighted entity set.

```
chg-mrn:pc=1-1-0:wt=10:pc1=1-1-10:wt1=20:pc2=1-1-2:wt2=5  
chg-mrn:pc=1-1-1:mrnset=111:mapset=df1t:mappc=2-1-1:mapssn=10  
chg-mrn:pc=1-1-1:mrnset=111:mapssn=*  
chg-mrn:pc=1-1-1:mrnset=111:mapset=1:mappc=2-1-2:mapssn=12  
chg-mrn:pci=1-002-1:mrnset=10:mapset=2:mappcn=00126:mapssn=12
```

Dependencies

The Intermediate Global Title Translation Load Sharing feature must be turned on before this command can be entered.

The **apca** and **pcn24** parameters cannot be specified for the same MRN set.

When a new point code is specified, its relative cost (**rc**) must be specified; a new point code and its relative cost must be entered together in the command.

A new point code that is specified in the command must not already exist in the MRN table.

The point codes cannot have the same value as the EAGLE 5 ISS SID.

The same point code value cannot be entered more than once in the MRN table.

Each point code group can contain a maximum of 32 point codes.

ITU-N point codes must be in the format set by the **npcfmti** parameter of the **chg-stpopts** command. (Use the **rtrv-stpopts** command to display the STP option settings).

Mate remote point codes must already exist as destinations in the Ordered Route entity set or reside in a cluster destination for which ordered routes are specified.

To change the relative cost for a point code, the point code must already exist in the MRN table.

The Flexible GTT Loadsharing feature must be enabled before the **mrnset** parameter can be specified..

If the Flexible GTT Loadsharing feature is enabled, the specified PC must already exist in the specified MRN set.

The specified MRN set must already exist in the MRN table.

One or more point codes in the command will exceed the maximum number of point codes that can be entered into the MRN table (3000 if the IGTTLS feature is turned on and 6000 if the IGTTLS and FGTTLS features are turned on).

The Weighted GTT Loadsharing feature must be turned on before the **wt/wt1/wt2/wt3/wt4**, **eswt**, **grpwt**, or **thr** parameter can be specified.

If the **rc** parameter is not specified, the **wt** parameter cannot be specified.

The **eswt** and **grpwt** parameters cannot be specified together in the command.

If the **eswt=none** parameter is specified, the **thr** parameter cannot be specified.

If the **eswt**, **grpwt**, or **thr** parameters are specified, the **rc/rc1/rc2/rc3/rc4** and **wt/wt1/wt2/wt3/wt4** parameters cannot be specified.

If the Weighted GTT Loadsharing feature is enabled, and individual PCs are being modified, the **wt** or **rc** parameter must be specified for each PC.

Alternate point codes cannot be specified when modifying an entity set or RC group.

If the **pc1/pc2/pc3/pc4** parameter is specified for a weighted entity set, a corresponding **wt1/wt2/wt3/wt4** parameter must be specified.

If the **pc1/pc2/pc3/pc4** parameter is specified for a non-weighted entity set, the **wt1/wt2/wt3/wt4** parameter cannot be specified.

The **eswt=none** parameter cannot be specified for non-weighted entity sets.

The **grpwt** and **thr** parameters cannot be specified for non-weighted entity sets.

At least one additional point code must be specified.

If the **wt/wt1/wt2/wt3/wt4** parameter is specified, the corresponding **pc/pc1/pc2/pc3/pc4** parameter must be specified.

The **pc/pc1/pc2/pc3/pc4** parameter values must be full point codes.

At least one optional parameter must be specified.

If the Weighted GTT Loadsharing feature is not enabled, and individual PCs are being modified, the **rc** parameter must be specified for each PC.

The **eswt**, **grpwt**, and **thr** parameters cannot be specified for solitary or dominant entity sets.

If the **chg-sid:pctype=ansi** command is entered, a value of *ni=000* cannot be specified. If the **chg-sid:pctype=ansi** command is entered, and a value of *ni=001 – 005* is specified, a value of *nc=000* cannot be specified

The **force=yes** parameter must be specified before the **rc**, **rc1**, **rc2**, **rc3**, or **rc4** parameter can be specified in the same command with the **wt**, **wt1**, **wt2**, **wt3**, or **wt4** parameter.

The **force** parameter can be used only to specify the **rc**, **rc1**, **rc2**, **rc3** or **rc4** parameter and the **wt**, **wt1**, **wt2**, **wt3**, or **wt4** parameter in the same command.

The value specified for the **pc/pc1/pc2/pc3/pc4** parameter cannot be associated with a proxy point code.

The GTT LS ARI feature must be enabled before the **mapset**, **mappc**, or **mapssn** parameter can be specified.

The value specified for the **mappc** parameter must be a full point code.

The point codes and alternate RI Mate point codes must have compatible network types as shown:

- ITUI, ITU-N, ITU-I spare, ITU-N-spare—ITUI, ITU-N, ITU-I spare, ITU-N-spare
- ANSI—ANSI
- ITUN-24—ITUN-24

The value specified for the **mapset** parameter must already exist in the MAP table.

The values specified for the **mappc** and **mapssn** parameters must already exist in the specified MAP Set.

The values specified for the **mapset** and **mappc** parameters must already exist in the MAP table.

The value specified for the **mappc** parameter cannot match an existing STP point code.

The **mappc** and **mapssn** parameters must be specified together in the command.

Notes

For the MRN commands, an entity set consists of a group of PCs that are used for traffic distribution, and an RC group consists of PCs within an entity set that have the same RC. In loadsharing mode, an entity set contains 1 RC group. In combined/dominant loadsharing mode, an entity set can contain multiple loadsharing groups.

All of the point codes that are specified in one command must exist in the same point code group in the MRN table.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

The EAGLE 5 ISS supports the following multiplicity modes for nodes/subsystems.

- A group of replicated PCs are in *dominant* mode if each PC in the group has a unique RC. The specified subsystem with the lowest RC acts as the primary subsystem, while the mate subsystem acts as a backup. In the event of congestion, messages route to the mate subsystem. When the congestion subsides, messages are again routed to the primary (dominant) subsystem.
- A group of replicated PCs are in *load sharing* mode if each PC in the group has the same RC. All messages are evenly distributed at the SCCP level to all nodes/subsystems in the group. In the event of congestion or failure, the non-affected subsystem assumes the load of its failed or congested mate.
- The *combined load sharing/dominant* mode supports a combination of load sharing and dominant mode. A group of PCs are in combined load sharing/dominant mode when at least two of the PCs have the same RC and another node subsystem in the group has a different RC. A combination of node accessibility and RC determines the preferred PC.

When the Weighted GTT Loadsharing feature is turned on, weighted entity sets and RC groups are supported, and threshold values can be assigned to each PC.

When the GTT LS ARI feature is enabled, the Alternate RI Mate for an MRN Set can be provisioned.

Output

```
chg-mrn:pci=1-1-2:mrnset=111:mapset=10:mappc=1-1-1:mapssn=*

;

chg-mtc-measopts**Change Maintenance Measurements Options**

Use this command to enable or disable the automatic generation and FTP transfer of scheduled maintenance measurements reports to the FTP server.

Keyword: chg-mtc-measopts

Related Commands: chg-ftp-serv, chg-meas, chg-measopts, chg-netopts, dlt-ftp-serv, ent-ftp-serv, rept-ftp-meas, rept-meas, rept-stat-meas, rtrv-ftp-serv, rtrv-measopts, rtrv-mtc-measopts, rtrv-netopts

Command Class: Link Maintenance

Parameters

NOTE: As of Release 44.0, the mtcdaiq, mtcdatinpq, mtcdeir, mtcgttpath, mtcmlink, mtcmlinkset, mtcldnp, mtcldmap, mtcldnp, mtcldsetpasoc, mtcldsetpcard, mtcldstp, mtcldstplan, mtcldua, mtcldvflex, mtchaiq, mtchatinpq, mtcheir, mtchgttpath, mtchlnp, mtchmap, mtchnp, mtchvflex parameters can be specified individually or as options for the on and off parameters.

NOTE: The options for the on and off parameters are specified in the Notes section.

:mtcdaiq= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled daily maintenance measurement report for ANSI41 AnalyzedInformation Query (ANSI41 AIQ).

Range: on, off

Default: No change to the current value.

System

Default: off

:mtcdatinpq= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled daily maintenance measurement report for ATI Number Portability Query (ATINP).

Range: on, off

Default: No change to the current value

System

Default: off

:mtcdeir= (optional)

Activates or deactivates the automatic generation and FTP transfer of the daily maintenance measurement report for Equipment Identity Register (EIR).

Range: on, off

Default: No change to the current value

System

Default: off

:mtcdgttpath= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled daily maintenance measurement report for GTT Action per path measurements.

Range: on, off

Default: No change to the current value

System

Default: off

:mtcdlink= (optional)

Activates or deactivates the automatic generation and FTP transfer of the daily maintenance measurement report for links.

Range: on, off
Default: No change to the current value
System
Default: off

:mtcdlnkset= (optional)

Activates or deactivates the automatic generation and FTP transfer of the daily maintenance measurement report for link sets.

Range: on, off
Default: No change to the current value
System
Default: off

:mtcdlnp= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled daily maintenance measurement report for LNP.

Range: on, off
Default: No change to the current value
System
Default: off

:mtcdmap= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled daily maintenance measurement report per GSM MAP Screening server entry.

Range: on, off
Default: No change to the current value
System
Default: off

:mtcdnp= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled daily maintenance measurement report for INP.

Range: on, off
Default: No change to the current value
System
Default: off

:mtcdsctpasoc= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled daily maintenance measurement report for per association SCTP data.

Range: on, off
Default: No change to the current value

:mtcdsctpcard= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled daily maintenance measurement report for per card SCTP data.

Range: on, off
Default: No change to the current value

:mtcdstp= (optional)

Activates or deactivates the automatic generation and FTP transfer of the daily maintenance measurement report for STP.

Range: on, off
Default: No change to the current value
System
Default: off

:mtcdstplan= (optional)

Activates or deactivates the automatic generation and FTP transfer of the daily maintenance measurement report for STPLAN.

Range: on, off

Default: No change to the current value

System

Default: off

:mtcdua= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled daily maintenance measurement report for M3UA and SUA application server/association pairs.

Range: on, off

Default: No change to the current value

System

Default: off

:mtcdvflex= (optional)

Activates or deactivates the automatic generation and FTP transfer of the daily maintenance measurement report for V-Flex (Voice Mail Router).

Range: on, off

Default: No change to the current value

System

Default: off

:mtchaiq= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled hourly maintenance measurement report of ANSI41 AnalyzedInformation Query (ANSI41 AIQ).

Range: on, off

Default: No change to the current value.

System

Default: off

:mtchatinpq= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled hourly maintenance measurement report of Any Time Interrogation (ATI) Number Portability (NP) Queries.

Range: on, off

Default: No change to the current value

System

Default: off

:mtcheir= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled hourly maintenance measurement report for Equipment Identity Register (EIR).

Range: on, off

Default: No change to the current value

System

Default: off

:mtchgttpath= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled hourly maintenance measurement report for GTT Action per path measurements.

Range: on, off

Default: No change to the current value

System

Default: off

:mtchlnp= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled hourly maintenance measurement report for LNP.

Range: on, off

Default: No change to the current value

System

Default: off

:mtchmap= (optional)

Activates or deactivates the automatic generation and FTP transfer of scheduled hourly maintenance measurement report per GSM MAP Screening server entry.

Range: on, off

Default: No change to the current value

System

Default: off

:mtchnp= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled hourly maintenance measurement report for INP.

Range: on, off

Default: No change to the current value

System

Default: off

:mtchvflex= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled hourly maintenance measurement report for V-Flex (Voice Mail Router).

Range: on, off

Default: No change to the current value

System

Default: off

:off= (optional)

This parameter turns off the specified options. Up to 8 comma-separated unique options can be specified.

Range: mtcdaiq, mtcdatainpq, mtcdair, mtcggttath, mtcclink, mtcclnkset, mtcclnp, mtcclmap, mtcclnp, mtcclspasoc, mtcclspcard, mtcclstp, mtcclstplan, mtcclua, mtcclvflex, mtchaiq, mtchatinpq, mtcheir, mtchggttath, mtchlnp, mtchmap, mtchnp, mtchvflex

:on= (optional)

This parameter turns on the specified options. Up to 8 comma-separated unique options can be specified.

Range: mtcdaiq, mtcdatainpq, mtcdair, mtcggttath, mtcclink, mtcclnkset, mtcclnp, mtcclmap, mtcclnp, mtcclspasoc, mtcclspcard, mtcclstp, mtcclstplan, mtcclua, mtcclvflex, mtchaiq, mtchatinpq, mtcheir, mtchggttath, mtchlnp, mtchmap, mtchnp, mtchvflex

Example

```
chg-mtc-measopts:mtcdair=off:mtcheir=on
```

```
chg-mtc-measopts:mtchvflex=on:mtcdvflex=on
```

```
chg-mtc-measopts:mtchaiq=on:mtcdaiq=on
```

```

chg-mtc-
measopts : on=mtcdaiq,mtcdatinpq,mtcdeir,mtcdgttpath,mtcdlink,mtcd
lnkset,mtcdlnp,mtcdmap
chg-mtc-
measopts : off=mtcdsctpcard,mtcdstp,mtcdstplan,mtcdua,mtcdvflex,mtc
haiq : on=mtchlmp,mtchmap

```

Dependencies

The LNP feature must be turned on before the **mtchlmp=on** or **mtcdlnp=on** parameter can be specified.

The GSM Map Screening (GSMSCR) feature must be turned on before the **mtcdmap=on** parameter or the **mtchmap=on** parameter can be specified.

The Equipment Identity Register (EIR) feature must be turned on before the **mtcheir=on** parameter or the **mtcdeir=on** parameter can be specified.

This command is not allowed while in upgrade mode.

The V-Flex feature must be turned on before the **mtchvflex=on** parameter or the **mtcdvflex=on** parameter can be specified.

The ATINP feature must be enabled before the **mtchatinpq=on** parameter or the **mtcdatinpq=on** parameter can be specified.

The A-Port, G-Port, IS41 GSM Migration, MO SMS IS41-to-GSM Migration, MO-based GSM SMS NP, MO-based IS41 SMS NP, Prepaid SMS Intercept Ph1, TIF ASD, TIF GRN, TIF Number Portability, or TIF Simple Number Substitution feature must be enabled, or the INP feature must be turned on before the **mtchnp=on** parameter or the **mtcdnp=on** parameter can be specified.

The ANSI41 AIQ feature must be enabled before the **mtchaiq=on** or **mtcdaiq=on** parameter can be specified.

The Integrated Measurements or Measurements Platform feature must be turned on before this command can be entered.

The GTT Action - DISCARD, GTT Action - FORWARD, or GTT Action - DUPLICATE feature must be enabled before the **mtchgttpath=on** or **mtcdgttpath=on** parameter can be specified.

The same option cannot be specified for the **on** and **off** parameters in the same command.

Parameters cannot be specified individually and as options for the **on** or **off** parameter in the same command.

Notes

Activated scheduled reports are generated and transferred to the customer's FTP server

The **rept-ftp-meas** command can be used to manually generate and transfer one report at a time as needed.

The *Maintenance Manual* provides detailed information on measurements and measurement reports.

on/off options

- **mtcdaiq** —Allows automatic generation and FTP transfer of the scheduled daily maintenance measurement report for ANSI41 AnalyzedInformation Query (ANSI41 AIQ). The option has a default of OFF.
- **mtcdatinpq** —Allows automatic generation and FTP transfer of the scheduled daily maintenance measurement report for ATI Number Portability Query (ATINP). The option has a default of OFF.

- **mtcdeir** —Allows automatic generation and FTP transfer of the daily maintenance measurement report for Equipment Identity Register (EIR). The option has a default of OFF.
- **mtcdgttpath** —Allows automatic generation and FTP transfer of the scheduled daily maintenance measurement report for GTT Action per path measurements. The option has a default of OFF.
- **mtcdlink** —Allows automatic generation and FTP transfer of the daily maintenance measurement report for links. The option has a default of OFF.
- **mtcdlinkset** —Allows automatic generation and FTP transfer of the daily maintenance measurement report for link sets. The option has a default of OFF.
- **mtcdlnp** —Allows automatic generation and FTP transfer of the scheduled daily maintenance measurement report for LNP. The option has a default of OFF.
- **mtcdmap** —Allows automatic generation and FTP transfer of the scheduled daily maintenance measurement report per GSM MAP Screening server entry. The option has a default of OFF.
- **mtcdnp** —Allows automatic generation and FTP transfer of the scheduled daily maintenance measurement report for INP. The option has a default of OFF.
- **mtcdsctpasoc** —Allows automatic generation and FTP transfer of the scheduled daily maintenance measurement report for per association SCTP data. The option has a default of OFF.
- **mtcdsctpcard** —Allows automatic generation and FTP transfer of the scheduled daily maintenance measurement report for per card SCTP data. The option has a default of OFF.
- **mtcdstp** —Allows automatic generation and FTP transfer of the daily maintenance measurement report for STP. The option has a default of OFF.
- **mtcdstplan** —Allows automatic generation and FTP transfer of the daily maintenance measurement report for STPLAN. The option has a default of OFF.
- **mtcdua** —Allows automatic generation and FTP transfer of the scheduled daily maintenance measurement report for M3UA and SUA application server/association pairs. The option has a default of OFF.
- **mtcdvflex** —Allows automatic generation and FTP transfer of the daily maintenance measurement report for V-Flex (Voice Mail Router). The option has a default of OFF.
- **mtchaiq** —Allows automatic generation and FTP transfer of the scheduled hourly maintenance measurement report of ANSI41 AnalyzedInformation Query (ANSI41 AIQ). The option has a default of OFF.
- **mtchatinpq** —Allows automatic generation and FTP transfer of the scheduled hourly maintenance measurement report of Any Time Interrogation (ATI) Number Portability (NP) Queries. The option has a default of OFF.
- **mtcheir** —Allows automatic generation and FTP transfer of the scheduled hourly maintenance measurement report for Equipment Identity Register (EIR). The option has a default of OFF.
- **mtchgttpath** —Allows automatic generation and FTP transfer of the scheduled hourly maintenance measurement report for GTT Action per path measurements. The option has a default of OFF.
- **mtchlnp** —Allows automatic generation and FTP transfer of the scheduled hourly maintenance measurement report for LNP. The option has a default of OFF.

- **mtchmap** —Allows automatic generation and FTP transfer of scheduled hourly maintenance measurement report per GSM MAP Screening server entry. The option has a default of OFF.
- **mtchnp** —Allows automatic generation and FTP transfer of the scheduled hourly maintenance measurement report for INP. The option has a default of OFF.
- **mtchvflex** —Allows automatic generation and FTP transfer of the scheduled hourly maintenance measurement report for V-Flex (Voice Mail Router). The option has a default of OFF.

chg-netopts

Change Network Options

Use this command to change the Private Virtual Network (PVN) address and PVN subnet mask values for the IP networks and the network address and subnet mask values for the Fast Copy networks used by the EAGLE 5 ISS.

CAUTION: Ensure that the configured addresses do not conflict with the DHCP IP addresses leased to STC cards (see the `mode=full` report generated by the `rept-stat-card` command). Conflicting IP addresses can adversely affect the EAGLE 5 Integrated Monitoring Support feature.

Keyword: chg-netopts

Related Commands: rtrv-netopts

Command Class: Database Administration

Parameters

:fcna= (optional)

Fast Copy Network A. This parameter specifies the network address for the Fast Copy A network.

NOTE: The `fcna` parameter consists of a classless Inter Domain Routing (Supernet) address with a network prefix of up to 23 bits.

Range: 0.0.2.0-255.255.253.0

The last 9 bits are zero (0) and are reserved for the Host ID.

Default: No change to the current value

System

Default: 172.21.48.00

:fcnb= (optional)

Fast Copy Network B. This parameter specifies the network address for the Fast Copy B network.

NOTE: The `fcnb` parameter consists of a classless Inter Domain Routing (Supernet) address with a network prefix of up to 23 bits.

Range: 0.0.2.0-255.255.253.0

The last 9 bits are zero (0) and are reserved for the Host ID.

Default: No change to the current value
System
Default: 172.22.48.00

:pvn= (optional)

Private Virtual Network address for the EAGLE 5 ISS. The value must be valid for a Class B network IP address. The host portion of the PVN address must be 0 based on the PVMASK.

Range: 128.0.0.0-191.255.255.0
 4 numbers separated by dots in the range 128.0.0.0 to 191.255.255.0

Default: No change to the current value
System
Default: 172.20.48.00

:pvmask= (optional)

This parameter specifies a subnet mask for the EAGLE 5 ISS PVN.

Range: The value must be valid for a Class B network IP address as shown in the following table.

Table 5-13. Valid PVN Subnet Mask Values

Valid for Class B Networks	
255.255.0.0	255.255.248.0
255.255.128.0	255.255.252.0
255.255.192.0	255.255.254.0
255.255.224.0	255.255.255.0
255.255.240.0	

Default: No change to the current value
System
Default: 255.255.252.00

Example

```
chg-netopts :pvn=170.120.50.1:pvmask=255.255.252.0
chg-netopts :fcna=170.120.50.0
chg-netopts :fcnb=172.121.50.0
```

Dependencies

At least one pair of optional parameters must be specified in the command (i.e. **pvn** and **pvmask** or **fcna** and **fcnb**).

The **pvn** and **pvmask** IP addresses cannot have the same value.

The **pvn** and **pvmask** parameters must be specified together in the command.

The IP network address specified by the **pvn/pvmask** or **fcna/fcnb** parameters cannot be the same as, overlap, or include any IP network or host addresses assigned to any Ethernet interface for any IP card.

The IP Network address specified by the **pvn** and **pvmask** parameters or the **fcna** and **fcnb** parameters cannot have an existing route in the IP Route table.

The E5IS feature must be turned on before this command can be specified.

The value specified for the **fcna** parameter must be a classless Inter Domain Routing (Supernet) address with a 23-bit network prefix.

The value specified for the **fcnb** parameter must be a classless Inter Domain Routing (Supernet) address with a 23-bit network prefix.

If the **femode=fcopy** parameter is specified (see the **chg-eisopts** command) for an IPSG or IPGHC GPL, then the **fcna** and **fcnb** parameters cannot be specified.

The **eiscopy=off** parameter must be specified (see the **chg-eisopts** command) before the **pvn** or **pvnmask** parameter can be specified.

The same value cannot be specified for the **pvn**, **fcna**, and **fcnb** parameters.

The same value cannot be specified for the **fcna** and **fcnamask** parameters.

The same value cannot be specified for the **fcnb** and **fcnbmask** parameters.

The value specified for the **pvn** parameter must be a valid Class B network IP address. The host portion of the value specified for the **pvn** parameter must be **0.0.0.0** based on the value specified for the **pvnmask** parameter.

The value specified for the **pvnmask** parameter must be a valid subnet IP address.

Notes

Fast Copy Cards

E5-ENET or E5-ENET-B cards running the IPSG or IPGHC GPL are considered to be *FC-capable*. A card running the IPGHC GPL must be in the IS-NR State before the card can be considered *FC-capable*. This restriction does not apply to cards running the IPSG GPL. An *FC-capable* card is considered *FC-enabled* when Fast Copy monitoring is enabled for the respective GPL.

Output

```
chg-netopts: fcna=170.120.50.0
tekelecstp 10-12-09 16:00:29 EST EAGLE 43.0.0
chg-netopts:fcna=170.120.50.0
Command entered at terminal #4.
CAUTION: Ensure that configured PVN/FCNA/FCNB addresses do not conflict
with the DHCP IP addresses leased to STC cards.

;
```

chg-npp-as

Change a NPP Action Set

Use this command to change a Numbering Plan Processor (NPP) Action Set (AS). An AS is used by the NPP to assist with digit string filtering, conditioning, and encoding for selected EAGLE 5 ISS applications. An AS is a collection of NPP Conditioning Actions (CAs), Service Actions (SAs), and Formatting Actions (FAs).

Keyword: **chg-npp-as**

Related Commands: **ent-npp-as**, **dlt-npp-as**, **rtrv-npp-as**

Command Class: Database Administration

Parameters

NOTE: CAs and FAs are processed in consecutive order. If the comma-separated list is used, then the CAs and FAs are processed in the order that they are specified in the list. If individual parameters are used, then the CAs and FAs do not have to be specified in consecutive numerical

order. However, they must be consecutively numbered within the command and must contain ca1 or fa1, respectively.

NOTE: SAs are processed in order of high-to-low precedence. If the comma-separated list is used, then the SAs must be specified in high-to-low precedence order in the list, and cannot be duplicated in the list. If multiple SAs have the same precedence, then the SAs are processed in the order in which they appear in the list. If individual parameters are used, then the SA with the highest precedence must be assigned as the value for sa1, and additional SAs must be assigned in descending precedence to consecutively numbered parameters. The SA parameters do not have to be specified in consecutive numerical order in the command. However, they must be consecutively numbered within the command and must contain sa1.

NOTE: The ac*, dn*, sn*, and cc* values refer to all CAs that begin with ac, dn, sn, or cc, respectively.

NOTE: To change the value of a single CA, FA, or SA within an AS, all of the associated parameters that were specified for that CA, FA, or SA for the AS must be entered.

NOTE: Refer to the *Numbering Plan Processor (NPP) Overview* and to the Feature Manual for the feature of interest for more information on provisioning Action Sets and for definitions for the CA, FA, and SA values.

NOTE: The sa(X)dgts parameters are currently not supported by any feature.

NOTE: The sa(X)val parameters are used by the TIF Range CgPN Blacklist and TIF Subscriber CgPN Blacklist features. Up to 2 numerical values can be specified in each list.

NOTE: If an sa(X) value is changed or removed, then any associated sa(X)val and sa(X)dgts parameters are set to none unless a new value is specified in the command.

NOTE: Support of a numerical values list (sa(X)val parameter) is specific to the Service and Service Action.

:asn= (mandatory)

Action set name. This parameter specifies the name of the AS.

Range: aaaaaaaaa
1 alphabetic character followed by up to 9 alphanumeric characters

:ca= (optional)

Conditioning Action list. This parameter specifies a comma-separated CA list that can be applied to an incoming digit string. Up to 12 CAs can be specified in the list. The CAs are processed in the order they are specified in the list.

Range: ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, pfx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfb1, pfb2, pfb3, pfb4, pfb5, pfb6, pfb7, pfb8, pfc1, pfc2, pfc3, pfc4, pfc5, pfc6, pfc7, pfc8, pfd1, pfd2, pfd3, pfd4, pfd5, pfd6, pfd7, pfd8, pfe1, pfe2, pfe3, pfe4, pfe5, pfe6, pfe7, pfe8, pxf1, pxf2, pxf3, pxf4, pxf5, pxf6, pxf7, pxf8, cc1, cc2, cc3, cdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn, acdef, cccgpn, accgpn1, accgpn2, accgpn3, accgpn4, accgpn5, accgpn6, accgpn7, accgpn8

:ca1= (optional)

Conditioning action 1. This parameter specifies the first CA that can be applied to an incoming digit string.

Range: ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfb1, pfb2, pfb3, pfb4, pfb5, pfb6, pfb7, pfb8, pfc1, pfc2, pfc3, pfc4, pfc5, pfc6, pfc7, pfc8, pfd1, pfd2, pfd3, pfd4, pfd5, pfd6, pfd7, pfd8, pxe1, pxe2, pxe3, pxe4, pxe5, pxe6, pxe7, pxe8, pxf1, pxf2, pxf3, pxf4, pxf5, pxf6, pxf7, pxf8, cc1, cc2, cc3, cdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn, acdef, cccgpn, accgpn1, accgpn2, accgpn3, accgpn4, accgpn5, accgpn6, accgpn7, accgpn8

:ca10= (optional)

Conditioning action 10. This parameter specifies the tenth CA that can be applied to an incoming digit string.

Range: ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfb1, pfb2, pfb3, pfb4, pfb5, pfb6, pfb7, pfb8, pfc1, pfc2, pfc3, pfc4, pfc5, pfc6, pfc7, pfc8, pfd1, pfd2, pfd3, pfd4, pfd5, pfd6, pfd7, pfd8, pxe1, pxe2, pxe3, pxe4, pxe5, pxe6, pxe7, pxe8, pxf1, pxf2, pxf3, pxf4, pxf5, pxf6, pxf7, pxf8, cc1, cc2, cc3, cdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn, acdef, cccgpn, accgpn1, accgpn2, accgpn3, accgpn4, accgpn5, accgpn6, accgpn7, accgpn8

:ca11= (optional)

Conditioning action 11. This parameter specifies the eleventh CA that can be applied to an incoming digit string.

Range: ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfb1, pfb2, pfb3, pfb4, pfb5, pfb6, pfb7, pfb8, pfc1, pfc2, pfc3, pfc4, pfc5, pfc6, pfc7, pfc8, pfd1, pfd2, pfd3, pfd4, pfd5, pfd6, pfd7, pfd8, pxe1, pxe2, pxe3, pxe4, pxe5, pxe6, pxe7, pxe8, pxf1, pxf2, pxf3, pxf4, pxf5, pxf6, pxf7, pxf8, cc1, cc2, cc3, cdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn, acdef, cccgpn, accgpn1, accgpn2, accgpn3, accgpn4, accgpn5, accgpn6, accgpn7, accgpn8

:ca12= (optional)

Conditioning action 12. This parameter specifies the twelfth CA that can be applied to an incoming digit string.

Range: ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfb1, pfb2, pfb3, pfb4, pfb5, pfb6, pfb7, pfb8, pfc1, pfc2, pfc3, pfc4, pfc5, pfc6, pfc7, pfc8, pfd1, pfd2, pfd3, pfd4, pfd5, pfd6, pfd7, pfd8, pxe1, pxe2, pxe3, pxe4, pxe5, pxe6, pxe7, pxe8, pxf1, pxf2, pxf3, pxf4, pxf5, pxf6, pxf7, pxf8, cc1, cc2, cc3, cdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13,

dn14, dn15, dnx, znx, aclac, accgpn, acdef, cccgpn, accgpn1, accgpn2, accgpn3, accgpn4, accgpn5, accgpn6, accgpn7, accgpn8

:ca2= (optional)

Conditioning action 2. This parameter specifies the second CA that can be applied to an incoming digit string.

Range: ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfb1, pfb2, pfb3, pfb4, pfb5, pfb6, pfb7, pfb8, pfc1, pfc2, pfc3, pfc4, pfc5, pfc6, pfc7, pfc8, pfd1, pfd2, pfd3, pfd4, pfd5, pfd6, pfd7, pfd8, pxe1, pxe2, pxe3, pxe4, pxe5, pxe6, pxe7, pxe8, pxf1, pxf2, pxf3, pxf4, pxf5, pxf6, pxf7, pxf8, cc1, cc2, cc3, cdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn, acdef, cccgpn, accgpn1, accgpn2, accgpn3, accgpn4, accgpn5, accgpn6, accgpn7, accgpn8

:ca3= (optional)

Conditioning action 3. This parameter specifies the third CA that can be applied to an incoming digit string.

Range: ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfb1, pfb2, pfb3, pfb4, pfb5, pfb6, pfb7, pfb8, pfc1, pfc2, pfc3, pfc4, pfc5, pfc6, pfc7, pfc8, pfd1, pfd2, pfd3, pfd4, pfd5, pfd6, pfd7, pfd8, pxe1, pxe2, pxe3, pxe4, pxe5, pxe6, pxe7, pxe8, pxf1, pxf2, pxf3, pxf4, pxf5, pxf6, pxf7, pxf8, cc1, cc2, cc3, cdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn, acdef, cccgpn, accgpn1, accgpn2, accgpn3, accgpn4, accgpn5, accgpn6, accgpn7, accgpn8

:ca4= (optional)

Conditioning action 4. This parameter specifies the fourth CA that can be applied to an incoming digit string.

Range: ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfb1, pfb2, pfb3, pfb4, pfb5, pfb6, pfb7, pfb8, pfc1, pfc2, pfc3, pfc4, pfc5, pfc6, pfc7, pfc8, pfd1, pfd2, pfd3, pfd4, pfd5, pfd6, pfd7, pfd8, pxe1, pxe2, pxe3, pxe4, pxe5, pxe6, pxe7, pxe8, pxf1, pxf2, pxf3, pxf4, pxf5, pxf6, pxf7, pxf8, cc1, cc2, cc3, cdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn, acdef, cccgpn, accgpn1, accgpn2, accgpn3, accgpn4, accgpn5, accgpn6, accgpn7, accgpn8

:ca5= (optional)

Conditioning action 5. This parameter specifies the fifth CA that can be applied to an incoming digit string.

Range: ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfb1, pfb2, pfb3, pfb4, pfb5, pfb6, pfb7, pfb8, pfc1, pfc2, pfc3, pfc4, pfc5, pfc6, pfc7, pfc8, pfd1, pfd2, pfd3, pfd4, pfd5, pfd6, pfd7, pfd8, pxe1, pxe2, pxe3, pxe4, pxe5, pxe6, pxe7, pxe8, pxf1, pxf2, pxf3, pxf4, pxf5, pxf6, pxf7, pxf8, cc1, cc2, cc3, cdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15,

snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn, acdef, cccgpn, accgpn1, accgpn2, accgpn3, accgpn4, accgpn5, accgpn6, accgpn7, accgpn8

:ca6= (optional)

Conditioning action 6. This parameter specifies the sixth CA that can be applied to an incoming digit string.

Range: **ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfb1, pfb2, pfb3, pfb4, pfb5, pfb6, pfb7, pfb8, pfc1, pfc2, pfc3, pfc4, pfc5, pfc6, pfc7, pfc8, pfd1, pfd2, pfd3, pfd4, pfd5, pfd6, pfd7, pfd8, pxe1, pxe2, pxe3, pxe4, pxe5, pxe6, pxe7, pxe8, pxf1, pxf2, pxf3, pxf4, pxf5, pxf6, pxf7, pxf8, cc1, cc2, cc3, cdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn, acdef, cccgpn, accgpn1, accgpn2, accgpn3, accgpn4, accgpn5, accgpn6, accgpn7, accgpn8**

:ca7= (optional)

Conditioning action 7. This parameter specifies the seventh CA that can be applied to an incoming digit string.

Range: **ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfb1, pfb2, pfb3, pfb4, pfb5, pfb6, pfb7, pfb8, pfc1, pfc2, pfc3, pfc4, pfc5, pfc6, pfc7, pfc8, pfd1, pfd2, pfd3, pfd4, pfd5, pfd6, pfd7, pfd8, pxe1, pxe2, pxe3, pxe4, pxe5, pxe6, pxe7, pxe8, pxf1, pxf2, pxf3, pxf4, pxf5, pxf6, pxf7, pxf8, cc1, cc2, cc3, cdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn, acdef, cccgpn, accgpn1, accgpn2, accgpn3, accgpn4, accgpn5, accgpn6, accgpn7, accgpn8**

:ca8= (optional)

Conditioning action 8. This parameter specifies the eighth CA that can be applied to an incoming digit string.

Range: **ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfb1, pfb2, pfb3, pfb4, pfb5, pfb6, pfb7, pfb8, pfc1, pfc2, pfc3, pfc4, pfc5, pfc6, pfc7, pfc8, pfd1, pfd2, pfd3, pfd4, pfd5, pfd6, pfd7, pfd8, pxe1, pxe2, pxe3, pxe4, pxe5, pxe6, pxe7, pxe8, pxf1, pxf2, pxf3, pxf4, pxf5, pxf6, pxf7, pxf8, cc1, cc2, cc3, cdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn, acdef, cccgpn, accgpn1, accgpn2, accgpn3, accgpn4, accgpn5, accgpn6, accgpn7, accgpn8**

:ca9= (optional)

Conditioning action 9. This parameter specifies the ninth CA that can be applied to an incoming digit string.

Range: **ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfb1, pfb2, pfb3, pfb4, pfb5, pfb6, pfb7, pfb8, pfc1, pfc2, pfc3, pfc4, pfc5, pfc6, pfc7, pfc8, pfd1, pfd2, pfd3, pfd4, pfd5, pfd6, pfd7, pfd8, pxe1, pxe2, pxe3, pxe4, pxe5, pxe6, pxe7, pxe8, pxf1, pxf2, pxf3, pxf4, pxf5, pxf6, pxf7, pxf8, cc1, cc2, cc3, cdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1,**

sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn, acdef, cccgpn, accgpn1, accgpn2, accgpn3, accgpn4, accgpn5, accgpn6, accgpn7, accgpn8

:fa= (optional)

Formatting Action list. This parameter specifies a comma-separated FA list that can be applied to the outgoing digit string. Up to 12 FAs can be specified in the list. The FAs are processed in the order they are specified in the list and cannot be duplicated.

Range: **sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid, srfimsi, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, rnospodn, rnospoz, rnosposn, asdoth, grnoth**

:fa1= (optional)

Formatting action 1. This parameter specifies the first FA that can be applied to the outgoing digit string.

Range: **sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid, rnospodn, rnospoz, rnosposn, srfimsi, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, asdoth, grnoth**

:fa10= (optional)

Formatting action 10. This parameter specifies the tenth FA that can be applied to the outgoing digit string.

Range: **sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid, srfimsi, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, rnospodn, rnospoz, rnosposn, asdoth, grnoth**

:fa11= (optional)

Formatting action 11. This parameter specifies the eleventh FA that can be applied to the outgoing digit string.

Range: **sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid, srfimsi, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, rnospodn, rnospoz, rnosposn, asdoth, grnoth**

:fa12= (optional)

Formatting action 12. This parameter specifies the twelfth FA that can be applied to the outgoing digit string.

Range: **sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid, srfimsi, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, rnospodn, rnospoz, rnosposn, asdoth, grnoth**

:fa2= (optional)

Formatting action 2. This parameter specifies the second FA that can be applied to the outgoing digit string.

Range: **sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid, srfimsi, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, rnospodn, rnospoz, rnosposn, asdoth, grnoth**

:fa3= (optional)

Formatting action 3. This parameter specifies the third FA that can be applied to the outgoing digit string.

Range: sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid, srfimsi, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, rnospodn, rnospoz, rnosposn, asdoth, grnoth

:fa4= (optional)

Formatting action 4. This parameter specifies the fourth FA that can be applied to the outgoing digit string.

Range: sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid, srfimsi, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, rnospodn, rnospoz, rnosposn, asdoth, grnoth

:fa5= (optional)

Formatting action 5. This parameter specifies the fifth FA that can be applied to the outgoing digit string.

Range: sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid, srfimsi, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, rnospodn, rnospoz, rnosposn, asdoth, grnoth

:fa6= (optional)

Formatting action 6. This parameter specifies the sixth FA that can be applied to the outgoing digit string.

Range: sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid, srfimsi, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, rnospodn, rnospoz, rnosposn, asdoth, grnoth

:fa7= (optional)

Formatting action 7. This parameter specifies the seventh FA that can be applied to the outgoing digit string.

Range: sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid, srfimsi, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, rnospodn, rnospoz, rnosposn, asdoth, grnoth

:fa8= (optional)

Formatting action 8. This parameter specifies the eighth FA that can be applied to the outgoing digit string.

Range: sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid, srfimsi, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, rnospodn, rnospoz, rnosposn, asdoth, grnoth

:fa9= (optional)

Formatting action 9. This parameter specifies the ninth FA that can be applied to the outgoing digit string.

Range: sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid, srfimsi, dlmd, dlme, dlmf, dlmg, dlmh, dlmi, dlmj, dlmk, dlml, dlmm, dlmn, dlmo, dlmp, rnospodn, rnospoz, rnosposn, asdoth, grnoth

:ofnai= (optional)

Outgoing filter nature of address indicator. This parameter specifies the filter nature of address indicator (FNAI) class of the outgoing digit string.

Range: **intl, natl, nai1, nai2, nai3, unkn, inc**

intl— **intl** value provisioned in the **chg-npp-serv** command

natl— **natl** value provisioned in the **chg-npp-serv** command

nai1— **nai1** value provisioned in the **chg-npp-serv** command

nai2— **nai2** value provisioned in the **chg-npp-serv** command

nai3— **nai3** value provisioned in the **chg-npp-serv** command

unkn— **unkn** value provisioned in the **chg-npp-serv** command

inc— NAI of the incoming digit string

:sa= (optional)

Service Action list. This parameter specifies a comma-separated SA list that can be applied to an incoming digit string. Up to 8 SAs can be specified in the list. The SAs must be specified in high-to-low precedence order in the list, and cannot be duplicated in the list.

Range: **rtdbtrn, rtdbtsp, rtdbtrnsp, cdial, cncchck, cdpnnp, cgpnp, cgpnsverqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, snscgpn, fraudchk, pprelay, migrate, asdlkup, grnlkup, cgpnasdrqd, cgpngrnrqd, nscgpn, nscdpn, blkstqry, blkstrly, cgpnrty, nocgpnrls, fpxrls, blrls, blnfndrls, inprtg, skgtartg, none**

none—Deletes ALL SAs from the Action Set.

:sa1= (optional)

Service action 1. This parameter specifies the first SA that can be applied to an incoming digit string. SAs are service-specific.

Range: **rtdbtrn, rtdbtsp, rtdbtrnsp, cdial, cncchck, cdpnnp, cgpnp, cgpnsverqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, snscgpn, fraudchk, pprelay, migrate, asdlkup, grnlkup, cgpnasdrqd, cgpngrnrqd, nscgpn, nscdpn, blkstqry, blkstrly, cgpnrty, nocgpnrls, fpxrls, blrls, blnfndrls, inprtg, skgtartg, none**

none—Deletes ALL SAs from the Action Set.

:sa1dgts= (optional)

Service Action 1 digit string. This parameter specifies a digit string that can be used with the first SA.

Range: 1-8 digits, **none**
1-8 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—Deletes digit string for this SA

:sa1val= (optional)

Service Action 1 numerical values list. This parameter specifies a comma-separated numerical values list that can be used with the first SA.

Range: **0-65534 none**
none—Deletes all numerical values for this SA from list

:sa2= (optional)

Service action 2. This parameter specifies the second SA that can be applied to an incoming digit string.

SAs are service-specific.

Range: **rtdbtrn, rtdbtsp, rtdbtrnsp, cdial, cncchck, cdpnnp, cgpnp, cgpnsverqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, snscgpn, fraudchk, pprelay, migrate, asdlkup, grnlkup, cgpnasdrqd, cgpngrnrqd, nscgpn, nscdpn, blkstqry, blkstrly, cgpnrty, nocgpnrls, fpxrls, blrls, blnfndrls, inprtg, skgtartg**

- :sa2dgts=** (optional)
Service Action 2 digit string. This parameter specifies a digit string that can be used with the second SA.
- Range:** 1-8 digits, **none**
1-8 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—Deletes digit string for this SA
- :sa2val=** (optional)
Service action 2 numerical values list. This parameter specifies a comma-separated numerical values list that can be used with the second SA.
- Range:** **0-65534 none**
none—Deletes all numerical values for this SA from list
- :sa3=** (optional)
Service action 3. This parameter specifies the third SA that can be applied to an incoming digit string. SAs are service-specific.
- Range:** **rtdbtrn, rtdbtsp, rtdbtrnsp, cdial, ccncchk, cdpnnp, cgpnpn, cgpnsverqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, snscgpn, fraudchk, pprelay, migrate, asdlkup, grnlkup, cgpnasdrqd, cgpngrnrqd, nscgpn, nscdpn, blklstqry, blklstly, cgpnrtdg, nocgpnrls, fpxrls, blrls, blnfndrls, inprtq, skgtartg**
- :sa3dgts=** (optional)
Service Action 3 digit string. This parameter specifies a digit string that can be used with the third SA.
- Range:** 1-8 digits, **none**
1-8 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—Deletes digit string for this SA
- :sa3val=** (optional)
Service Action 3 numerical values list. This parameter specifies a comma-separated numerical values list that can be used with the third SA.
- Range:** **0-65534 none**
none—Deletes all numerical values for this SA from list
- :sa4=** (optional)
Service action 4. This parameter specifies the fourth SA that can be applied to an incoming digit string. SAs are service-specific.
- Range:** **rtdbtrn, rtdbtsp, rtdbtrnsp, cdial, ccncchk, cdpnnp, cgpnpn, cgpnsverqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, snscgpn, fraudchk, pprelay, migrate, asdlkup, grnlkup, cgpnasdrqd, cgpngrnrqd, nscgpn, nscdpn, blklstqry, blklstly, cgpnrtdg, nocgpnrls, fpxrls, blrls, blnfndrls, inprtq, skgtartg**
- :sa4dgts=** (optional)
Service Action 4 digit string. This parameter specifies a digit string that can be used with the fourth SA.
- Range:** 1-8 digits, **none**
1-8 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—Deletes digit string for this SA
- :sa4val=** (optional)
Service Action 4 numerical values list. This parameter specifies a comma-separated numerical values list that can be used with the fourth SA.
- Range:** **0-65534 none**
none—Deletes all numerical values for this SA from list

:sa5= (optional)

Service action 5. This parameter specifies the fifth SA that can be applied to an incoming digit string. SAs are service-specific.

Range: **rtdbtrn, rtdbtsp, rtdbtrnsp, cdial, ccncchk, cdpnnp, cgpnp, cgpnsverqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, snsccgpn, fraudchk, pprelay, migrate, asdlkup, grnlkup, cgpnasdrqd, cgpngrnrqd, nscgpn, nscdpn, blkstqry, blklstly, cgpnrty, nocgpnrls, fpxrls, blrls, blnfndrls, inprty, skgtartg**

:sa5dgts= (optional)

Service Action 5 digit string. This parameter specifies a digit string that can be used with the fifth SA.

Range: 1-8 digits, **none**
1-8 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—Deletes digit string for this SA

:sa5val= (optional)

Service Action 5 numerical values list. This parameter specifies a comma-separated numerical values list that can be used with the fifth SA.

Range: **0-65534 none**
none—Deletes all numerical values for this SA from list

:sa6= (optional)

Service action 6. This parameter specifies the sixth SA that can be applied to an incoming digit string. SAs are service-specific.

Range: **rtdbtrn, rtdbtsp, rtdbtrnsp, cdial, ccncchk, cdpnnp, cgpnp, cgpnsverqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, snsccgpn, fraudchk, pprelay, migrate, asdlkup, grnlkup, cgpnasdrqd, cgpngrnrqd, nscgpn, nscdpn, blkstqry, blklstly, cgpnrty, nocgpnrls, fpxrls, blrls, blnfndrls, inprty, skgtartg**

:sa6dgts= (optional)

Service Action 6 digit string. This parameter specifies a digit string that can be used with the sixth SA.

Range: 1-8 digits, **none**
1-8 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—Deletes digit string for this SA

:sa6val= (optional)

Service Action 6 numerical values list. This parameter specifies a comma-separated numerical values list that can be used with the sixth SA.

Range: **0-65534 none**
none—Deletes all numerical values for this SA from list

:sa7= (optional)

Service action 7. This parameter specifies the seventh SA that can be applied to an incoming digit string.

SAs are service-specific.

Range: **rtdbtrn, rtdbtsp, rtdbtrnsp, cdial, ccncchk, cdpnnp, cgpnp, cgpnsverqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, snsccgpn, fraudchk, pprelay, migrate, asdlkup, grnlkup, cgpnasdrqd, cgpngrnrqd, nscgpn, nscdpn, blkstqry, blklstly, cgpnrty, nocgpnrls, fpxrls, blrls, blnfndrls, inprty, skgtartg**

:sa7dgts= (optional)

Service Action 7 digit string. This parameter specifies a digit string that can be used with the seventh SA.

Range: 1-8 digits, **none**
 1-8 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—Deletes digit string for this SA

:sa7val= (optional)

Service Action 7 numerical values list. This parameter specifies a comma-separated numerical values list that can be used with the seventh SA.

Range: **0-65534 none**
none—Deletes all numerical values for this SA from list

:sa8= (optional)

Service action 8. This parameter specifies the eighth SA that can be applied to an incoming digit string.

SAs are service-specific.

Range: **rtdbtrn, rtdbtsp, rtdbtrnsp, cdial, ccncchk, cdpnnp, cgpnp, cgpnsverqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, snsngpn, fraudchk, pprelay, migrate, asdlkup, grnlkup, cgpnasdrqd, cgpngrnrqd, nscgpn, nscdpn, blklstqry, blklstly, cgpnrty, nocgpnrls, fpxrls, blrls, blnfnrls, inprtg, skgtartg**

:sa8dgts= (optional)

Service Action 8 digit string. This parameter specifies a digit string that can be used with the eighth SA.

Range: 1-8 digits, **none**
 1-8 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—Deletes digit string for this SA

:sa8val= (optional)

Service Action 8 numerical values list. This parameter specifies a comma-separated numerical values list that can be used with the eighth SA.

Range: **0-65534 none**
none—Deletes all numerical values for this SA from list

Dependencies

One of the following combinations of Conditioning Actions must be specified:

- **znx**
- **cc***, **dn***
- **cc***, **ac***, **sn***

The existing or new Formatting Actions specified for the AS must contain the corresponding Formatting Action that a Conditioning Action will populate or load.

The AS must contain a CA that can load or populate the specified FA.

If specified, the **caX** parameters must be consecutively numbered, always including **ca1**. The parameters do not have to be entered in sequential order in the command.

If specified, the **saX** parameters must be consecutively numbered and must include **sa1**. The parameters do not have to be entered in sequential order in the command.

If specified, the **faX** parameters must be consecutively numbered, always including **fa1**. The parameters do not have to be entered in sequential order in the command.

The CAs within an AS cannot condition more than 32 digits.

The AS cannot contain CAs that load or populate the same FA.

Conditioning Actions must be specified for inclusion in an individual Action Set using valid number conditioning rules:

- If the ZNX Conditioning Action is specified, then the CC*, AC*, SN*, DN*, and DNX Conditioning Actions cannot be specified.
- If the CC* AND DN* or DNX Conditioning Actions are specified, then the AC*, SN*, SNX, and ZNX Conditioning Actions cannot be specified.
- If the CC*, AC*, AND SN* or SNX Conditioning Actions are specified, then the DN*, DNX, and ZNX Conditioning Actions cannot be specified.

The same value cannot be specified for the **faX** parameters within an AS.

The AS cannot contain the following combinations of FAs:

- If the DN Formatting Action is specified, then the AC, SN, and ZN Formatting Actions cannot be specified.
- If the ZN Formatting Action is specified, then the AC, CC, SN, and DN Formatting Actions cannot be specified.
- If the SN Formatting Action is specified, then the ZN and DN Formatting Actions cannot be specified.
- If the RNOSPODN, RNOSPOSN, or RNOSPOZN Formatting Action is specified, then the RN, SP, SN, DN, and ZN Formatting Actions cannot be specified.
- The RNOSPODN, RNOSPOSN, and RNOSPOZN Formatting Actions cannot be specified together.

If specified, the FPFX CA must be the first value (**fpfx**) in the **ca** value list or **caX** parameter sequence.

If specified, the ZNX, SNX, or DNX CA must be the final value (**znx**, **snx**, or **dnx**) in the **ca** value list or **caX** parameter sequence.

The same value cannot be specified for the **saX** parameters within an AS.

If rules that reference an AS exist, then the AS cannot be changed.

The **ca** and **caX**, **fa** and **faX**, and **sa** and **saX** parameters cannot be specified together in the command.

The AS specified by the **asn** parameter must already exist.

If no Service Actions are provisioned, then only a value of **none** can be specified for the **sa1val** parameter.

If less than 2 Service Actions are provisioned, then only a value of **none** can be specified for the **sa2val** parameter.

If less than 3 Service Actions are provisioned, then only a value of **none** can be specified for the **sa3val** parameter.

If less than 4 Service Actions are provisioned, then only a value of **none** can be specified for the **sa4val** parameter.

If less than 5 Service Actions are provisioned, then only a value of **none** can be specified for the **sa5val** parameter.

If less than 6 Service Actions are provisioned, then only a value of **none** can be specified for the **sa6val** parameter.

If less than 7 Service Actions are provisioned, then only a value of **none** can be specified for the **sa7val** parameter.

If less than 8 Service Actions are provisioned, then only a value of **none** can be specified for the **sa8val** parameter.

If no Service Actions are provisioned, then only a value of **none** can be specified for the **sa1dgts** parameter.

If less than 2 Service Actions are provisioned, then only a value of **none** can be specified for the **sa2dgts** parameter.

If less than 3 Service Actions are provisioned, then only a value of **none** can be specified for the **sa3dgts** parameter.

If less than 4 Service Actions are provisioned, then only a value of **none** can be specified for the **sa4dgts** parameter.

If less than 5 Service Actions are provisioned, then only a value of **none** can be specified for the **sa5dgts** parameter.

If less than 6 Service Actions are provisioned, then only a value of **none** can be specified for the **sa6dgts** parameter.

If less than 7 Service Actions are provisioned, then only a value of **none** can be specified for the **sa7dgts** parameter.

If less than 8 Service Actions are provisioned, then only a value of **none** can be specified for the **sa8dgts** parameter.

Notes

None.

chg-npp-serv**Change NPP Service Data**

Use this command to change a Numbering Plan Processor (NPP) service entry. An NPP service is any EAGLE 5 ISS feature that uses the NPP to assist with the processing of digit strings.

NOTE: This command can be used to enter values for the dlma - dlmc parameters.

However, if these parameters have a value other than none in the tifopts:dlma - dlmc or ttropts:dlma - dlmc commands, then those values will overwrite the values that were entered for the parameters using the chg-npp-serv command for the TIF and IDPR services, respectively.

NOTE: The intl, natl, nai1, nai2, nai3, and unkn parameters are used to change the FNAI class to NAI mappings for a service.

A value of incoming must be specified for the ttropts:snai parameter before the intl, natl, nai1, nai2, nai3, and unkn parameters can be changed to non-default values for the IDPRCDPN(X) service.

A value of incoming must be specified for the ttropts:cgsnai parameter before the intl, natl, nai1, nai2, nai3, and unkn parameters can be changed to non-default values for the IDPRCGPN service.

A value of nai must be specified for the is41smsopts:mosmsnai parameter before the intl, natl, nai1, nai2, nai3, and unkn parameters can be changed to non-default values for the MOSMSICDPN service

A value of nai must be specified for the gsmmsopts:mosmsnai parameter before the intl, natl, nai1, nai2, nai3, and unkn parameters can be changed to non-default values for the MOSMSGCDPN service

Keyword: chg-npp-serv

Related Commands: chg-npp-srs, dlt-npp-srs, ent-npp-srs, rtrv-npp-serv, rtrv-npp-srs

Command Class: Database Administration

Parameters

:srvn= (mandatory)

Service name. This parameter specifies the name of the NPP Service.

Range: nppt, idprcdpn, idprcgp, tif, tif2, tif3, mosmsicgpn, mosmsicdpn, mosmsgcgpn, mosmsgcdpn, iarcdpn, iarcgpn, idprcdpn2, idprcdpn3, idprcdpn4, tifcgp, tifcgp2, tifcgp3

nppt — NPP Test Service

idprcdpn — IDPRCDPN Service

idprcgp — IDPRCGPN Service

tif — TIF Service

tif2 — TIF2 Service

tif3 — TIF3 Service

mosmsicgpn — MOSMSICGPN Service

mosmsicdpn — MOSMSICDPN Service

mosmsgcgpn — MOSMSGCGPN Service

mosmsgcdpn — MOSMSGCDPN Service

iarcdpn — IARCDPN Service

iarcgpn — IARCGPN Service

idprcdpn2 — IDPRCDPN2 Service

idprcdpn3 — IDPRCDPN3 Service

idprcdpn4 — IDPRCDPN4 Service

tifcgp — TIFCGPN Service

tifcgp2 — TIFCGPN2 Service

tifcgp3 — TIFCGPN3 Service

- :dlma=** (optional)
This parameter specifies a delimiter that is used to format the outgoing dialed number.
Range: 1-16 digits, **none**
1-16 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—deletes the current value of the delimiter
Default: **none**
- :dlmb=** (optional)
This parameter specifies a delimiter that is used to format the outgoing dialed number.
Range: 1-16 digits, **none**
1-16 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—deletes the current value of the delimiter
Default: **none**
- :dlmc=** (optional)
This parameter specifies a delimiter that is used to format the outgoing dialed number.
Range: 1-16 digits, **none**
1-16 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—deletes the current value of the delimiter
Default: **none**
- :dlmd=** (optional)
This parameter specifies a delimiter that is used to format the outgoing dialed number.
Range: 1-16 digits, **none**
1-16 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—deletes the current value of the delimiter
Default: **none**
- :dlme=** (optional)
This parameter specifies a delimiter that is used to format the outgoing dialed number.
Range: 1-16 digits, **none**
1-16 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—deletes the current value of the delimiter
Default: **none**
- :dlmf=** (optional)
This parameter specifies a delimiter that is used to format the outgoing dialed number.
Range: 1-16 digits, **none**
1-16 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—deletes the current value of the delimiter
Default: **none**
- :dlmg=** (optional)
This parameter specifies a delimiter that is used to format the outgoing dialed number.
Range: 1-16 digits, **none**
1-16 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—deletes the current value of the delimiter
Default: **none**
- :dlmh=** (optional)
This parameter specifies a delimiter that is used to format the outgoing dialed number.
Range: 1-16 digits, **none**
1-16 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—deletes the current value of the delimiter
Default: **none**

:dlmi= (optional)

This parameter specifies a delimiter that is used to format the outgoing dialed number.

Range: 1-16 digits, **none**
1-16 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—deletes the current value of the delimiter

Default: **none**

:dlmj= (optional)

This parameter specifies a delimiter that is used to format the outgoing dialed number.

Range: 1-16 digits, **none**
1-16 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—deletes the current value of the delimiter

Default: **none**

:dlmk= (optional)

This parameter specifies a delimiter that is used to format the outgoing dialed number.

Range: 1-16 digits, **none**
1-16 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—deletes the current value of the delimiter

Default: **none**

:dlml= (optional)

This parameter specifies a delimiter that is used to format the outgoing dialed number.

Range: 1-16 digits, **none**
1-16 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—deletes the current value of the delimiter

Default: **none**

:dlmm= (optional)

This parameter specifies a delimiter that is used to format the outgoing dialed number.

Range: 1-16 digits, **none**
1-16 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—deletes the current value of the delimiter

Default: **none**

:dlmn= (optional)

This parameter specifies a delimiter that is used to format the outgoing dialed number.

Range: 1-16 digits, **none**
1-16 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—deletes the current value of the delimiter

Default: **none**

:dlmo= (optional)

This parameter specifies a delimiter that is used to format the outgoing dialed number.

Range: 1-16 digits, **none**
1-16 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—deletes the current value of the delimiter

Default: **none**

:dlmp= (optional)

This parameter specifies a delimiter that is used to format the outgoing dialed number.

Range: 1-16 digits, **none**
1-16 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
none—deletes the current value of the delimiter

Default: **none**

:intl= (optional)

International. This parameter maps an International FNAI class to the NAI of the incoming digit string.

Range: 0-255 none

none—A rule with an FNAI or OFNAI of **intl** cannot be provisioned

Default: No change to the current value

System

Default: 1 - IARCDPN, IARCGPN services and all MOSMS services

4 - NPPT, TIF, TIF2, TIF3, IDPRCDPN, IDPRCDPN2, IDPRCDPN3, IDPRCDPN4 and IDPRCGPN services

:nai1= (optional)

This parameter maps an NAI-1 FNAI class to the NAI of the incoming digit string.

Range: 0-255 none

none—A rule with an FNAI or OFNAI of **nai1** cannot be provisioned

Default: No change to the current value

System

Default: none

:nai2= (optional)

This parameter maps an NAI-2 FNAI class to the NAI of the incoming digit string.

Range: 0-255 none

none—A rule with an FNAI or OFNAI of **nai2** cannot be provisioned

Default: No change to the current value

System

Default: none

:nai3= (optional)

This parameter maps an NAI-3 FNAI class to the NAI of the incoming digit string.

Range: 0-255 none

none—A rule with an FNAI or OFNAI of **nai3** cannot be provisioned

Default: No change to the current value

System

Default: none

:natl= (optional)

This parameter maps a National FNAI class to the NAI of the incoming digit string.

Range: 0-255 none

none—A rule with an FNAI or OFNAI of **natl** cannot be provisioned

Default: No change to the current value

System

Default: 0 - IARCDPN, IARCGPN, MOSMSICDPN and MOSMSICGPN services

2 - MOSMSGCDPN and MOSMSGCGPN services

3 - NPPT, TIF, TIF2, TIF3, IDPRCDPN, IDPRCDPN2, IDPRCDPN3, IDPRCDPN4, and IDPRCGPN services

:status= (optional)

This parameter specifies whether the service can be processed by the NPP.

Range: off, on

off— The service cannot be processed by the NPP.

on— The service can be processed by the NPP.

The **status=on** parameter must be specified before a service can be processed by the NPP.

Default: off

:unkn= (optional)

This parameter maps an Unknown FNAI class to the NAI of the incoming digit string.

Range: 0-255

Default: No change to the current value

System 0 - NPPT, TIF, TIF2, TIF3, IDPRCDPN, IDPRCDPN2, IDPRCDPN3, IDPRCDPN4,

Default: IDPRCGPN, MOSMSGCDPN and MOSMSGCGPN services

2 - IARCDPN, IARCGPN, MOSMSICDPN and MOSMSICGPN services

Example

```
chg-npp-serv:svn=nppt:status=on
```

```
chg-npp-serv:svn=nppt:status=on:nai3=6:intl=15:natl=50
```

```
chg-npp-serv:svn=nppt:status=on:nai3=6:intl=15
```

```
chg-npp-
```

```
serv:svn=tif:dlma=1234567890abcdef:dlmb=aaaaabbbbbcdd:dlmc=10  
2030405
```

Dependencies

The service specified by the **svn** parameter must have associated rules before the **status=on** parameter can be specified.

If the service specified by the **svn** parameter references any NPP rules, then the **intl**, **natl**, **nai1**, **nai2**, and **nai3** parameters cannot have a value of **none**.

Output

```
chg-npp-serv:svn=nppt:status=on:nai3=6:intl=15:natl=50
```

```
tekelecstp 08-05-17 15:55:35 EAGLE 39.0.0
```

```
chg-npp-serv:svn=nppt:status=on:nai3=6:intl=15:natl=50
```

```
CHG-NPP-SERV: MASP A - COMPLTD
```

```

chg-npp-srs

Change a NPP Service Rule Set

Use this command to change the Action Set (AS) that is associated with a Numbering Plan Processor (NPP) Rule. An NPP Rule is an association between a single NPP filter and an AS.

NOTE: The contents of the AS are configured using the ent/chg-npp-as commands.

Keyword: chg-npp-srs

Related Commands: chg-npp-as, dlt-npp-srs, ent-npp-as, ent-npp-srs, rtrv-npp-as, rtrv-npp-srs

Command Class: Database Administration

Parameters

:fdl= (mandatory)

Filter digit length. This parameter specifies the number of digits on the incoming digit string that is filtered by the NPP.

Range: 1-32 *

*—multiple lengths of digit strings can be filtered

:fnai= (mandatory)

Filter nature of address indicator. This parameter specifies the filter Nature of Address Indicator (NAI) class.

Range: intl, natl, nai1, nai2, nai3, unkn

intl — filter messages with NAI=INTL

natl — filter messages with NAI=NATL

nai1 — filter messages with NAI=NAI1
nai2 — filter messages with NAI=NAI2
nai3 — filter messages with NAI=NAI3
unkn — filter messages with NAI=UNKN

The **chg-npp-serv** command is used to assign values to the various FNAI classes.

:fpx= (mandatory)

Filter prefix. This parameter specifies the prefix used to filter incoming digit strings.

Range: 1-16 digits, *, ?

1 - 16 hexadecimal digits inclusive of single digit wildcard (?); or wildcard (*) matching the entire digit string; valid digits are ?, 0-9, a-f, A-F.

:srvn= (mandatory)

Service name. This parameter specifies the name of the NPP Service.

Range: **nppt, idprcdpn, idprcgpn, tif, tif2, tif3, mosmsicgpn, mosmsicdpn, mosmsgcgpn, mosmsgcdpn, iarcdpn, iarcgpn, idprcdpn2, idprcdpn3, idprcdpn4, tifcgpn, tifcgpn2, tifcgpn3**

nppt — NPP Test Service

idprcdpn — IDPRCDPN Service

idprcgpn — IDPRCGPN Service

tif — TIF Service

tif2 — TIF2 Service

tif3 — TIF3 Service

mosmsicgpn — MOSMSICGPN Service

mosmsicdpn — MOSMSICDPN Service

mosmsgcgpn — MOSMSGCGPN Service

mosmsgcdpn — MOSMSGCDPN Service

iarcdpn — IARCDPN Service

iarcgpn — IARCGPN Service

idprcdpn2 — IDPRCDPN2 Service

idprcdpn3 — IDPRCDPN3 Service

idprcdpn4 — IDPRCDPN4 Service

tifcgpn — TIFCGPN Service

tifcgpn2 — TIFCGPN2 Service

tifcgpn3 — TIFCGPN3 Service

:asn= (optional)

Action set name. This parameter specifies the name of the AS.

Range: *aaaaaaaa*

1 alphabetic character followed by up to 9 alphanumeric characters

Default: No change to the current value

:invkserv= (optional)

Invoke service name. This parameter specifies the name of the NPP service to be invoked.

NOTE: As of Release 44.0, only the tifcgpn, tifcgpn2, tifcgpn3, and none values are supported.

Range: **nppt, idprcdpn, idprcgpn, tif, tif2, tif3, mosmsicgpn, mosmsicdpn, mosmsgcgpn, mosmsgcdpn, iarcdpn, iarcgpn, idprcdpn2, idprcdpn3, idprcdpn4, tifcgpn, tifcgpn2, tifcgpn3, none**

nppt, none — NPP Test Service

idprcdpn, none — IDPRCDPN Service

idprcgpn, none — IDPRCGPN Service

tif, none — TIF Service

tif2, none — TIF2 Service

tif3, none— TIF3 Service
mosmsicgpn, none— MOSMSICGPN Service
mosmsicdpn, none— MOSMSICDPN Service
mosmsgcgpn, none— MOSMSGCGPN Service
mosmsgcdpn, none— MOSMSGCDPN Service
iarcdpn, none— IARCDPN Service
iarcgpn, none— IARCGPN Service
idprcdpn2, none— IDPRCDPN2 Service
idprcdpn3, none— IDPRCDPN3 Service
idprcdpn4, none— IDPRCDPN4
tifcgpn, none— TIFCGPN
tifcgpn2, none— TIFCGPN2
tifcgpn3, none— TIFCGPN3
none—no additional NPP services are invoked

Default: No change to the current value

System

Default: none

Example

```

chg-npp-srs:svrn=nppt:fpfx=a:fdl=16:fnai=intl:asn=asn3
chg-npp-
srs:svrn=tif:fnai=intl:fpfx=9090:fdl=:asn=set1:invkserv=tifcgpn
chg-npp-srs:svrn=idprcdpn4:fpfx=91:fnai=intl:asn=asn9:fdl=12
  
```

Dependencies

The AS specified by the **asn** parameter must already exist in the NPP AS table.

The AS specified by the **asn** parameter cannot contain Conditioning Actions that are not supported by the service specified by the **svrn** parameter.

The AS specified by the **asn** parameter cannot contain Service Actions that are not supported by the service specified by the **svrn** parameter.

The AS specified by the **asn** parameter cannot contain Formatting Actions that are not supported by the service specified by the **svrn** parameter.

The AS specified by the **asn** parameter cannot contain Service Actions that do not conform to the precedence order that is supported by the service specified by the **svrn** parameter.

The Conditioning Actions in the AS specified by the **asn** parameter cannot condition more digits than allowed by the **fdl** parameter.

If the **fdl=*** parameter is specified, then the AS specified by the **asn** parameter must contain Conditioning Actions that support variable digit string conditioning.

The NPP Rule that is specified by the **fdl**, **fnai**, **fpfx**, and **svrn** parameters must already exist in the NPP Rule table.

All of the features associated with the Service Actions in the AS specified by the **asn** parameter must be turned on before the AS can be used.

The Service Actions in the AS specified by the **asn** parameter cannot violate mutual exclusivity rules defined by the service specified by the **svrn** parameter. Refer to the Feature Manual for the feature of interest for additional information.

The AS specified by the **asn** parameter cannot contain an OFNAI class with a value of **none**.

At least one TIF feature must be turned on before an AS containing the CDIAL Service Action can be specified as a value for the **asn** parameter.

The TIF SCS Forwarding feature must be turned on before an AS containing the FWDSCS Service Action can be specified as a value for the **asn** parameter.

The TIF Simple Number Substitution feature must be turned on before an AS containing the SNSCGPN Service Action can be specified as a value for the **asn** parameter.

The TIF Number Portability feature must be turned on before an AS containing the CRP, NPNRLS, CGPNNPRQD, NPRELAY, or NPRLS Service Action can be specified as a value for the **asn** parameter.

The IDPR ASD feature must be enabled before an AS containing the ASDLKUP or CPGNASDRQD Service Action can be specified as a value for the **asn** parameter with the IDPRCDPN(X) or IDPRCGPN service.

The IDPR GRN feature must be enabled before an AS containing the GRNLKUP or CGPNGRNRQD Service Action can be specified as a value for the **asn** parameter with the IDPRCDPN(X) or IDPRCGPN service.

An AS containing the ASDLKUP and CPGNASDRQD Service Actions cannot be specified as a value for the **asn** parameter.

An AS containing the GRNLKUP and CGPNGRNRQD Service Actions cannot be specified as a value for the **asn** parameter.

If a value of **tif**, **tif2**, or **tif3** is specified for the **servn** parameter, then the TIF ASD feature must be enabled before an AS containing the ASDLKUP or CPGNASDRQD Service Action can be specified as value for the **asn** parameter.

The TIF GRN feature must be enabled before an AS containing the GRNLKUP or CGPNGRNRQD Service Actions can be specified as a value for the **asn** parameter with the TIF services.

If a value of **mosmsgcdpn**, **mosmsgcgpn**, **mosmsicdpn**, or **mosmsicgpn** is specified for the **servn** parameter, then the MO SMS ASD feature must be enabled before an AS containing the ASDLKUP or CPGNASDRQD Service Action can be specified as a value for the **asn** parameter.

If a value of **mosmsgcdpn**, **mosmsgcgpn**, **mosmsicdpn**, or **mosmsicgpn** is specified for the **servn** parameter, then the MO SMS GRN feature must be enabled before an AS containing the CGPNGRNRQD or GRNLKUP Service Action can be specified as a value for the **asn** parameter.

If a rule contains an FPFX with a wildcard value, then the rule cannot also contain an AS where the FPFX Conditioning Action is specified.

The TIF Number Substitution feature must be enabled before an AS containing the NSCGPN or NSCDPN Service Action can be specified as a value for the **asn** parameter.

The AS specified by the **asn** parameter cannot contain both the NSCGPN and SNSCGPN Service Actions.

If a value of **mosmsgcdpn** or **mosmsgcgpn** is specified for the **servn** parameter, then the Prepaid SMS Intercept Ph1 feature must be enabled before an AS containing the PPRELAY Service Action can be specified as a value for the **asn** parameter.

If the **servn=mosmsgcgpn** parameter is specified, then the Portability Check for MO SMS feature must be enabled before an AS containing the FRAUDCHK Service Action can be specified as a value for the **asn** parameter.

If the **servn=mosmsicdpn** parameter is specified, then the MO SMS IS41-to-GSM Migration feature must be enabled before an AS containing the MIGRATE Service Action can be specified as a value for the **asn** parameter.

If the **servn=mosmsicdpn** parameter is specified, then the MO-based IS41 SMS NP feature must be enabled before an AS containing the CDPNNP Service Action can be specified as a value for the **asn** parameter.

If the **servn=mosmsgcdpn** parameter is specified, then the MO-based GSM SMS NP feature must be enabled before an AS containing the CDPNNP Service Action can be specified as a value for the **asn** parameter.

The IDP A-Party Routing feature must be enabled before the AS specified by the **asn** parameter can contain the CGPNRTG Service Action.

The IDP A-Party Blacklist feature must be enabled before the AS specified by the **asn** parameter can contain the BLKLSTQRY or BLKLSTRLY Service Action.

If the AS specified by the **asn** parameter contains the BLKLSTQRY Service Action, then the AS cannot contain any other Service Actions.

If the **srvn=idprcdpn(X)** parameter is specified, then the Action Set specified by the **asn** parameter cannot contain both the ACCGPN* and CCCGPN Conditioning Actions.

If a value of **iarcddpn** or **iarcgpn** is specified for the **servn** parameter, then the IAR Base feature must be enabled before an AS containing the CCNCCHK, CDIAL, or CPGNSRVRQQD Service Action can be specified as a value for the **asn** parameter.

If a value of **iarcddpn** or **iarcgpn** is specified for the **servn** parameter, then the IAR NP feature must be enabled before an AS containing the CDPNNP or CGPNNP Service Action can be specified as a value for the **asn** parameter.

If a value of **iarcddpn** or **iarcgpn** is specified for the **servn** parameter, then the IAR ASD feature must be enabled before an AS containing the ASDLKUP or CGPNASDRQD Service Action can be specified as a value for the **asn** parameter.

If a value of **iarcddpn** or **iarcgpn** is specified for the **servn** parameter, then the IAR GRN feature must be enabled before an AS containing the GRNLKUP or CGPNGRNRQD Service Action can be specified as a value for the **asn** parameter.

If the NPP Service specified by the **srvn** parameter does not support invoking another NPP Service, then only a value of **none** can be specified for the **invkserv** parameter.

If the NPP Service specified by the **srvn** parameter can invoke the TIFCGPN NPP Service, then only a value of **tifcgpn** or **none** can be specified for the **invkserv** parameter.

If the NPP Service specified by the **srvn** parameter can invoke the TIFCGPN3 NPP Service, then only a value of **tifcgpn3** or **none** can be specified for the **invkserv** parameter.

If the AS specified by the **asn** parameter contains the ASDOTHER or GRNOTHER Formatting Action, then the **invkserv=none** parameter cannot be specified.

If the AS specified by the **asn** parameter contains the CGPNASDRQD, CGPNGRNQD, CGPNSVCRQD, NSCGPN, or SNSCGPN Service Action, then only a value of **none** can be specified for the **invkserv** parameter.

The TIF Range CgPN Blacklist feature must be enabled before:

- an AS containing the NOCGPNRLS Service Action can be specified as a value for the **asn** parameter and a value of **tif**, **tif2**, or **tif3** can be specified for the **srvn** parameter
- an AS containing the FPFXRLS Service Action can be specified as a value for the **asn** parameter and a value of **tifcgpn**, **tifcgpn2**, or **tifcgpn3** can be specified for the **srvn** parameter

If the AS specified by the **asn** parameter contains the FPFXRLS Service Action, then no other Service Action can be specified in the AS.

If the AS specified by the **asn** parameter contains the FPFXRLS Service Action, then the AS must also contain a numerical values list with 2 numerical values.

If the AS specified by the **asn** parameter contains the FPFXRLS Service Action, then the 2 numerical values specified by the numerical values list must each be between **0-127**.

If the AS specified by the **asn** parameter contains the NOCGPNRLS Service Action, then the AS must also contain a numerical values list with 2 numerical values.

If the AS specified by the **asn** parameter contains the NOCGPNRLS Service Action, then the 2 numerical values specified by the numerical values list must each be between **0-127**.

The TIF Subscr CgPN Blacklist feature must be enabled before an AS containing the BLRLS or BLNFNDRLS Service Action can be specified as a value for the **asn** parameter, and a value of **tifcgn**, **tifcgn2**, or **tifcgn3** can be specified as a value for the **srvn** parameter.

If the AS specified by the **asn** parameter contains the BLRLS Service Action, then the AS must also contain a numerical values list with 2 numerical values.

If the AS specified by the **asn** parameter contains the BLRLS Service Action, then the 2 numerical values specified by the numerical values list must each be between **0-127**.

If the AS specified by the **asn** parameter contains the BLNFNDRLS Service Action, then the AS must also contain a numerical values list with 2 numerical values.

If the AS specified by the **asn** parameter contains the BLNFNDRLS Service Action, then the 2 numerical values specified by the numerical values list must each be between **0-127**.

If the Service specified by the **srvn** parameter does not support a numerical value list for the first Service Action in the AS specified by the **asn** parameter, then the **sa1val** parameter in the AS can only have a value of **none**.

If the Service specified by the **srvn** parameter does not support a numerical value list for the second Service Action in the AS specified by the **asn** parameter, then the **sa2val** parameter in the AS can only have a value of **none**.

If the Service specified by the **srvn** parameter does not support a numerical value list for the third Service Action in the AS specified by the **asn** parameter, then the **sa3val** parameter in the AS can only have a value of **none**.

If the Service specified by the **srvn** parameter does not support a numerical value list for the fourth Service Action in the AS specified by the **asn** parameter, then the **sa4val** parameter in the AS can only have a value of **none**.

If the Service specified by the **srvn** parameter does not support a numerical value list for the fifth Service Action in the AS specified by the **asn** parameter, then the **sa5val** parameter in the AS can only have a value of **none**.

If the Service specified by the **srvn** parameter does not support a numerical value list for the sixth Service Action in the AS specified by the **asn** parameter, then the **sa6val** parameter in the AS can only have a value of **none**.

If the Service specified by the **srvn** parameter does not support a numerical value list for the seventh Service Action in the AS specified by the **asn** parameter, then the **sa7val** parameter in the AS can only have a value of **none**.

If the Service specified by the **srvn** parameter does not support a numerical value list for the eighth Service Action in the AS specified by the **asn** parameter, then the **sa8val** parameter in the AS can only have a value of **none**.

If the Service specified by the **srvn** parameter does not support a digit string for the first Service Action in the AS specified by the **asn** parameter, then the **sa1dgts** parameter in the AS can only have a value of **none**.

If the Service specified by the **srvn** parameter does not support a digit string for the second Service Action in the AS specified by the **asn** parameter, then the **sa2dgts** parameter in the AS can only have a value of **none**.

If the Service specified by the **srvn** parameter does not support a digit string for the third Service Action in the AS specified by the **asn** parameter, then the **sa3dgts** parameter in the AS can only have a value of **none**.

If the Service specified by the **srvn** parameter does not support a digit string for the fourth Service Action in the AS specified by the **asn** parameter, then the **sa4dgts** parameter in the AS can only have a value of **none**.

If the Service specified by the **srvn** parameter does not support a digit string for the fifth Service Action in the AS specified by the **asn** parameter, then the **sa5dgts** parameter in the AS can only have a value of **none**.

If the Service specified by the **srvn** parameter does not support a digit string for the sixth Service Action in the AS specified by the **asn** parameter, then the **sa6dgts** parameter in the AS can only have a value of **none**.

If the Service specified by the **srvn** parameter does not support a digit string for the seventh Service Action in the AS specified by the **asn** parameter, then the **sa7dgts** parameter in the AS can only have a value of **none**.

If the NPP Service specified by the **srvn** parameter can invoke the TIFCGPN2 NPP Service, then only a value of **tifcgp2** or **none** can be specified for the **invkserv** parameter.

If the Service specified by the **srvn** parameter does not support a digit string for the eighth Service Action in the AS specified by the **asn** parameter, then the **sa8dgts** parameter in the AS can only have a value of **none**.

At least one optional parameter must be specified.

A new value must be specified for the **asn** or **invkserv** parameter.

Notes

chg-oap-config

Change OAP Configuration

Use this command to configure the EAGLE 5 ISS database with the OAP configuration information. This information is sent to the specified OAP with the **act-oap-config** command.

NOTE: This command enables you to configure the OAP from the EAGLE 5 ISS terminal. You should no longer perform this function from a terminal connected to the OAP.

NOTE: As of Release 42.0, this command is obsolete.

Keyword: chg-oap-config

Related Commands: chg-lnp-serv, chg-sid, dlt-lnp-serv, ent-lnp-serv, rtrv-lnp-serv, rtrv-oap-config, rtrv-sid

Command Class: Database Administration

Parameters

NOTE: You must provision the EAGLE 5 ISS database with valid information for the SEAS feature if this feature is turned on (as shown by SEAS=on in the output of the rtrv-feat

command). The information must be provisioned to clear the checksum mismatch alarm (UAM 0364).

NOTE: The following parameters are no longer available: **lsms, mpssel, mssel, mnsap, snsap, spsel, sssel**

:aipaddr= (optional)

The IP address of OAP A. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. A sample IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number. If you are unsure of your IP address, check with your Information Services department.

Range: **1-223, 0-255**
 4 numbers separated by dots
 1-223—first number
 0-255—the other three numbers

:aname= (optional)

The name assigned to OAP A.

This parameter is mandatory for SEAS.

Range: *x*xxxxxxxxxxxx
 1 alphabetic character followed by 1 to 13 alphanumeric characters.
 The value must be enclosed in double quotation marks (" "); for example,
 aname="tekelec-10".

:anmask= (optional)

The netmask for OAP A. If you are not sure that your network requires this configuration, check with your Information Services department.

Depending on your network configuration, this parameter may be mandatory for SEAS.

Range: 4 numbers separated by dots, with each number in the range of **0-255**.

:arouter= (optional)

The IP address of the default router assigned to OAP A. This is a TCP/IP address expressed in standard "dot notation." IP addresses consist of the system's network number and the machine's unique host number. A sample IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number. If you are not sure if your network requires this configuration, check with your Information Services department.

Depending on your network configuration, this parameter may be mandatory for SEAS.

Range: **1-223, 0-255**
 4 numbers separated by dots
 1-223—first number
 0-255—the other three numbers

:bipaddr= (optional)

The IP address of OAP B. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. A sample IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number. If you are unsure of your IP address, check with your Information Services department.

Range: **1-223, 0-255**
 4 numbers separated by dots
 1-223—first number
 0-255—the other three numbers

:bname= (optional)

The name assigned to OAP B.

This parameter is mandatory for SEAS.

Range: *x*xxxxxxxxxxxx

1 alphabetic character followed by 1 to 13 alphanumeric characters.

The value must be enclosed in double quotation marks (" "), for example,

bname="tekelec-10" .

:bnmask= (optional)

The netmask for OAP B. If you are not sure that your network requires this configuration, check with your Information Services department.

Depending on your network configuration, this parameter may be mandatory for SEAS.

Range: **1-223, 0-255**

4 numbers separated by dots

1-223—first number

0-255—the other three numbers

:brouter= (optional)

The IP address of the default router assigned to OAP B. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. A sample IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number. If you are not sure that your network requires this configuration, check with your Information Services department.

Depending on your network configuration, this parameter may be mandatory for SEAS.

Range: 4 numbers separated by dots, with each number in the range of **0-255**.

:cfg= (optional)

The number of OAPs being configured.

This parameter is mandatory for SEAS.

Range: **sngl, dual**

sngl— OAP A

dual— OAP A and OAP B

:seaccli= (optional)

The common language location identifier (CLLI) of the SEAC the OAP is connecting to.

This parameter is mandatory for SEAS.

Range: *a*yyyyyyyyyy

1 alphabetic character followed by 1 to 10 alphanumeric characters.

:x25mode= (optional)

The mode of the x.25 link to the SEAC.

This parameter is mandatory for SEAS.

Range: **dte, dce**

:x25ps= (optional)

The x.25 packet size for the link to the SEAC.

This parameter is mandatory for SEAS.

Range: **7, 8**

Example

```
chg-oap-config:aname="tekelec-xx":bname="tekelec-xx"
```

```
chg-oap-config:aipaddr=128.132.64.15:bipaddr=128.132.64.16
```

Dependencies

At least one parameter must be specified each time the **chg-oap-config** command is entered.

The **chg-oap-config** command allows one or several parameters to be specified at a time. If the required information for a feature has already been provisioned in the EAGLE 5 ISS database, all of the parameters for that feature do not need to be specified when you make a change. It is mandatory, however, that the configuration data in the EAGLE 5 ISS and the OAP database match. The EAGLE 5 ISS generates an alarm (UAM 0364) if the EAGLE 5 ISS database is not provisioned with the same information as the OAP.

To keep OAP parameters in sync with the EAGLE 5 ISS, a checksum is created using all of the OAP configuration data stored on the EAGLE 5 ISS. The OAP also calculates this checksum based on the data it has. The OAP returns this checksum every five seconds. The EAGLE 5 ISS compares the checksums, and generates the following alarm within ten seconds of any mismatch:

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
* nnnn.0364 * OAP A Configuration data checksum mismatch
```

The alarm is cleared when a maintenance poll returns a checksum that matches the EAGLE 5 ISS' checksum, indicating that the databases are back in sync. The EAGLE 5 ISS clears the alarm within five seconds. The following UAM clears the alarm:

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
nnnn.0365 OAP A Configuration data checksum alarm cleared
```

In addition to parameters configured with the **chg-oap-config** command, the EAGLE 5 ISS' Site ID (:cli) is also included in the checksum. See the **chg-sid** command for more information.

The SEAS feature must be turned on before the **seaccli** parameter can be specified.

The SEAS feature must be turned on before the **x25ps** parameter can be specified.

The SEAS feature must be turned on before the **x25mode** parameter can be specified.

Notes

None

Output

```
chg-oap-config: aipaddr=128.132.64.15:bipaddr=128.132.64.16

chg-pid

Change Password ID

Use this command to change your password.

When this command is executed, you are prompted to enter your current password. This prevents anyone but you from changing your password.

Keyword: chg-pid

Related Commands: act-user, chg-secu-dflt, chg-user, dact-user, dlt-user, ent-user, login, logout, rept-stat-user, rtrv-secu-dflt, rtrv-secu-user, rtrv-user

Command Class: Basic

Parameters

This command has no parameters.

Example

```
chg-pid
```

Dependencies

This command cannot be entered from a terminal that is configured as an OAP terminal.

The password can contain up to 12 characters.

The password must contain at least the number of characters specified by the **minlen** parameter in the **chg-secu-dflt** command.

The password must contain at least the number of alphabetic characters specified by the **alpha** parameter in the **chg-secu-dflt** command.

The password must contain at least the number of numeric characters specified by the **num** parameter in the **chg-secu-dflt** command.

The password must contain at least the number of punctuation characters specified by the **punc** parameter in the **chg-secu-dflt** command.

The password cannot contain the associated User ID.

The number of days specified by the **minintrvl** parameter in the **chg-secu-dflt** command must pass between password changes.

The password must contain fewer duplicate characters from the existing password than the number specified by the **pchreuse** parameter in the **chg-secu-dflt** command.

The password cannot be the same as a previous password if the limit in the password history, specified by the **preuse** parameter of the **chg-secu-dflt** command, has been reached.

The current password cannot be entered as the new password.

The OA&M IP Security Enhancements feature must be turned on before passwords can be created or modified from a telnet terminal (terminal IDs 17-40).

The value entered for password verification must match the value entered for the password.

Notes

When a new system is shipped, both the user ID and password are set to the system. Change these immediately to ensure system security.

Output**chg-pid**

```

Enter Old Password : <old password> Enter New Password : <new password>

If secu-dflt parameter preuse is non zero and pchreuse is non zero:

New password must contain:

- between 8 and 12 characters
- at least 1 alphabetic character(s) ('a'-'z')
- at least 1 numeric character(s) ('0'-'9')
- at least 1 punctuation character(s) (e.g. \$%@#)

New password must:

- be unique from the old password
- be unique from the last 2 historical password(s)
- not reuse more than 4 character(s) from the old password

If secu-dflt parameter preuse is non zero and pchreuse is zero:

New password must contain:

- between 8 and 12 characters
- at least 1 alphabetic character(s) ('a'-'z')
- at least 1 numeric character(s) ('0'-'9')
- at least 1 punctuation character(s) (e.g. \$%@#)

New password must:

- be unique from the old password
- be unique from the last 2 historical password(s)

If secu-dflt parameter preuse is zero and pchreuse is non zero:

New password must contain:

- between 8 and 12 characters
- at least 1 alphabetic character(s) ('a'-'z')
- at least 1 numeric character(s) ('0'-'9')
- at least 1 punctuation character(s) (e.g. \$%@#)

New password must:

- be unique from the old password
- not reuse more than 4 character(s) from the old password

If secu-dflt parameter preuse is zero and pchreuse is zero:

New password must contain:

- between 8 and 12 characters
- at least 1 alphabetic character(s) ('a'-'z')
- at least 1 numeric character(s) ('0'-'9')
- at least 1 punctuation character(s) (e.g. \$%@#)

New password must:

- be unique from the old password

chg-ppsopts**Change Prepaid SMS Options**

Use this command to enter Prepaid Short Message Service options (PPSOPTS) in the database. This command updates the PPSOPTS Table with entries that correspond to Intelligent Network (IN) platforms.

Keyword: chg-ppsopts

Related Commands: rtrv-ppsopts

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

NOTE: If the CgPA GTA matches the value of the **gta**, **gta1**, **gta2**, or **gta3** parameter during message screening, then the message falls through to GTT instead of receiving PPSMS screening.

:bpartychk= (optional)

MO SMS B-Party PPSMS Check. This parameter specifies whether a prepaid check on the B-Party is performed on an incoming MO SMS message.

Range: **off, on**
 off— Prepaid Check on B-Party is not performed
 on— Prepaid Check on B-Party is performed

Default: No change to current value

System

Default: **off**

:gta= (optional)

Global title address. This parameter specifies the entity address for an IN platform and determines whether an incoming message receives PPSMS screening.

Range: 1-15 digits
 Valid digits are **0-9, A-F, a-f**.

Default: No change to current value

:gta1= (optional)

Global title address. This parameter specifies the entity address for an IN platform and determines whether an incoming message receives PPSMS screening.

Range: 1-15 digits
 Valid digits are **0-9, A-F, a-f**.

Default: No change to current value.

:gta2= (optional)

Global title address. This parameter specifies the entity address for an IN platform and determines whether an incoming message receives PPSMS screening.

Range: 1-15 digits
 Valid digits are **0-9, A-F, a-f**.

Default: No change to current value.

:gta3= (optional)

Global title address. This parameter specifies the entity address for an IN platform and determines whether an incoming message receives PPSMS screening.

Range: 1-15 digits
 Valid digits are **0-9, A-F, a-f**.

Default: No change to current value.

:ngta= (optional)

New global title address. This parameter specifies an entity address that replaces an existing entity address for an IN platform.

Range: 1-15 digits, **none**
 Valid digits are **0-9, A-F, a-f**.
 none—Deletes the current value.

Default: No change to current value.

:pc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **pca**

Range: **p-, 000-255, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid for *ni = 001-005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.

Enter **none** to delete the point code.

The point code **000-000-000** is not a valid point code.

Default: No change to current value.

:pci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

Enter **none** to delete the point code.

The point code **0-000-0** is not a valid point code.

Default: No change to current value.

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

Enter **none** to delete the point code.

Default: No change to current value.

:ppt= (optional)

Prepaid portability type. This parameter specifies the IN platform where the incoming message is sent.

Range: 1-32

:ri= (optional)

Routing indicator. This parameter specifies the IN platform routing indicator.

Range: **gt, ssn**

gt— Routes on the GT value.

ssn— Routes on the SSN value.

Default: No change to current value.

:setid= (optional)

Set ID. This parameter specifies the MAP set ID (if the **ri=ssn** parameter is specified) or the MRN set ID (if the **ri=gt** parameter is specified) that is used by a loadsharing IN platform.

If the FGTTLS feature is not enabled, lookup is performed in the default set of the MAP table or MRN table.

Range: 1 - 36000, none, dflt

1 - 36000, none, dflt— MAP Table

1 - 3000—MRN table

none—Lookup is not performed. This value applies only to the MRN table.

dflt—Lookup is performed in the default MAP set or MRN set.

Default: No change to current value.

:ssn= (optional)

Subsystem number

Range: 2-255 none

Default: none

Example

The following command provisions a single GTA in the PPSOPTS table.

```
chg-ppsopts:gta=1234
```

The following command provisions four GTAs in the PPSOPTS table.

```
chg-ppsopts:gta=1101:gta1=1102:gta2=1103:gta3=1104
```

The following command replaces an existing GTA with a new GTA.

```
chg-ppsopts:gta=1101:ngta=4567
```

The following command deletes a specified GTA from the PPSOPTS table.

```
chg-ppsopts:gta=1102:ngta=none
```

The following command deletes the pc, ri, and setid values for a specified IN platform.

```
chg-ppsopts:ppt=1:pci=none
```

The following command provisions a loadsharing set for a specified IN platform.

```
chg-ppsopts:ppt=2:setid=2
```

The following example provisions point code, routing indicator, and set ID values for a specified IN platform and loadsharing set.

```
chg-ppsopts:ppt=1:pci=1-1-1:ri=gt:setid=1
```

The following command provisions the prepaid check on B-Party.

```
chg-ppsopts:bpartychk=on
```

The following example provisions ANSI point code, routing indicator, and set ID values for a specified IN platform and loadsharing set.

```
chg-ppsopts:ppt=2:pca=2-2-1:ri=ssn:setid=4
```

Dependencies

At least one parameter must be specified.

The PPSMS, IDP A-Party Routing, or IDP Service Key Routing feature must be turned on before this command can be entered.

If the **ngta** parameter is specified, then the **gta** parameter must be specified.

The **gta**, **gta1**, **gta2**, and **gta3** parameters cannot have a value of **none**.

If the **ngta** parameter is specified, the **gta** parameter value must already exist in the database.

The **ngta** parameter value cannot already exist in the database.

The value specified for the for the **pc**, **pca**, **pci**, or **pcn** parameter cannot be the same as the STP True Point Code.

The value specified for the **pc**, **pca**, **pci**, or **pcn** parameter cannot be the same as the STP Capability Point Code.

If the **pc**, **ri**, **ssn**, or **setid** parameter is specified, then the **ppt** parameter must be specified.

If the **gta1**, **gta2**, or **gta3** parameter is specified, then the **ngta** parameter cannot be specified.

The Flexible GTT Load Sharing (FGTTLS) feature must be enabled before the **setid** parameter can be specified.

If the **ri=gt** parameter is specified, then the value of the **setid** parameter cannot exceed the value of the maximum MRN set ID.

The value specified for the **pc**, **pca**, **pci**, or **pcn** parameter must already exist in the Routing Indicator table.

The value of the **gta**, **gta1**, **gta2**, or **gta3** parameter cannot already exist in the database unless the **ngta** parameter is specified.

The **pc/pca/pci/pcn** parameter and the **ri** parameter must be specified together in the command, or a value of **none** must be specified for the **pc/pca/pci/pcn** parameter.

The **gta**, **gta1**, **gta2**, and **gta3** parameters cannot have the same value.

A maximum of 32 GTA values (for 32 IN platforms) can be defined in the database.

If the Flexible GTT Load Sharing (FGTTLS) feature is enabled, and if the **ri=ssn** parameter is specified, then the values specified for the **pc/pca/pci/pcn**, and **ssn** parameters must exist in the MAP table in the MAP set specified by the **setid** parameter, or in the default MAP set if the **setid** parameter is not specified.

If the **ri=gt** parameter is specified, then the value specified for the **pc**, **pca**, **pci**, or **pcn** parameter must exist in the MRN table.

If the **ri=ssn** parameter is specified, then the **setid=none** parameter cannot be specified.

The **pc/pca/pci/pcn**, **ri**, **setid**, and **ssn** parameters must be specified before the **ppt** parameter can be specified.

The **pc**, **pca**, **pci**, or **pcn** parameter must be provisioned for the prepaid type specified by the **ppt** parameter before the **setid** parameter can be specified.

If a value of **none** is specified for the **pc**, **pca**, **pci**, or **pcn** parameter, then the **ri** or **setid** parameter cannot be specified.

If the Flexible GTT Load Sharing (FGTTLS) feature is not enabled, and if the **ri=ssn** parameter is specified, then the value specified for the **pc**, **pca**, **pci**, or **pcn** parameter must exist in the default MAP set of the MAP table.

The value specified for the **pc/pca/pci/pcn** parameter cannot be associated with a proxy point code.

If the **ssn** parameter is specified, then the **pc/pca/pci/pcn** parameter must be specified.

Notes

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes.

The GTA digits are used during message screening to determine whether an incoming message should receive PPSMS screening. If the CgPA GTA matches the value of any of the GTA parameters, then the message falls through to GTT instead of receiving PPSMS screening.

The point code and routing indicator values (the **pc**, **pca**, **pci**, **pcn**, and **ri** parameters) are used to route messages from prepaid subscribers to the correct IN for credit checking.

Output

```
chg-ppsopts:ppt=1:pci=1-1-1:ri=gt:setid=1
tekelecstp 06-06-25 09:04:14 EST EAGLE 37.0.0
CHG-PPSOPTS: MASP A - COMPLTD
;
```

chg-prefix

Change Prefix

Use this command to enter the name of a feature, the value of a prefix used by the feature, and a prefix number that is used to refer to the prefix from another table.

Keyword: **chg-prefix**

Related Commands: **dlt-prefix**, **rtrv-ctrl-feat**, **rtrv-prefix**

Command Class: Database Administration

Parameters

:feature= (mandatory)

Feature Name. This parameter specifies the name of an enabled controlled feature that is supported by this command. The parameter value must match the feature name as it is displayed in the **rtrv-ctrl-feat** command output.

Range: *aaaaaaaaaaaaaaaaaaaaaaaa*

1 alphabetic character and up to 24 optional alphanumeric characters and spaces, enclosed in double quotation marks.

The parameter value is not case-sensitive; upper case or lower case or both can be entered.

Part or all of the feature name can be entered. If part of the feature name is specified, the entry must start with the first letter of the name, and must contain enough of the name to uniquely identify the feature. For example, there are two feature names that begin with "GSM MAP." Enough additional characters to identify which GSM MAP feature is being entered (at least "GSM MAP SR" to identify the "GSM MAP SRI Redirect" feature). This command supports the following controlled features:

- GSM MAP SRI Redirect
- ISUP NP for EPAP

:prefix= (mandatory)

Prefix Value. Prefix table entries for the GSM MAP SRI Redirect and ISUP NP with EPAP features.

Range: 1-15 digits
1-15 hexadecimal digits; valid digits are **0-9**, **a-f**, **A-F**.

Default: Current value

:prefixnum= (mandatory)

Prefix Number. The prefix number identifies the prefix value to use for the specified feature name.

Range: 1-7
 1-3 for GSM MAP SRI Redirect feature prefix values
 1-5 for ISUP NP with EPAP feature prefix values
 6 for the ISUP NP with EPAP feature Insertion Country Code
 7 for the ISUP NP with EPAP feature Deletion Condition value

Default: Current value

Example

Define a prefix with prefix number 1 for the ISUP NP with EPAP feature.

```
chg-prefix:feature="isup np with epap":prefix=1004:prefixnum=1
```

Define a prefix with prefix number 2 and specify part of the GSM MAP SRI Redirect feature name.

```
chg-prefix:feature="GSM MAP SRI":prefix=104:prefixnum=2
```

Dependencies

The specified feature name value (**feature** parameter) must be enclosed in double quotation marks (" ").

The G-Port feature must be turned on before a prefix can be defined for the GSM MAP SRI Redirect feature.

The GSM MAP SRI Redirect feature must be enabled before a GSM MAP SRI Redirect prefix can be defined.

The ISUP NP with EPAP feature must be enabled before an ISUP NP with EPAP prefix can be defined.

The specified prefix value must contain a number of digits that is equal to or greater than the minimum number of digits required by the specified feature.

The specified prefix value must contain a number of digits that is equal to or less than the maximum number of digits required by the specified feature.

The prefix value **none** is not valid for GSM MAP SRI Redirect prefixes.

The specified prefix number (**prefixnum**) must be valid for the specified feature.

The maximum number of prefixes that can be defined is:

- 3 for the GSM MAP SRI Redirect feature
- 5 values, 1 Insertion Country Code, and 1 Deletion Condition for the ISUP NP with EPAP feature

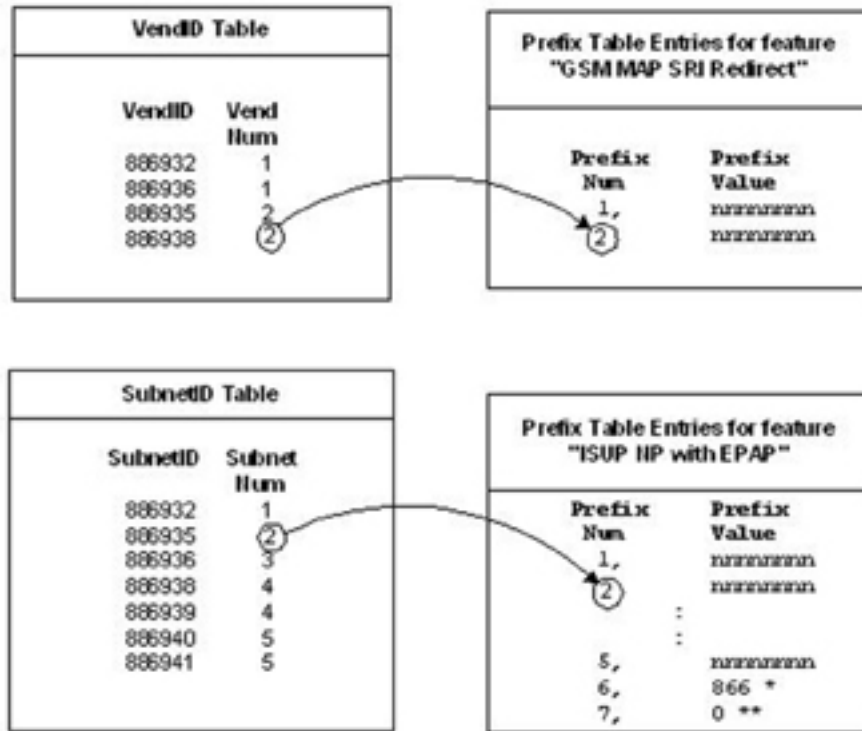

The specified feature name must be the name of an enabled controlled feature as it is displayed in the **rtrv-ctrl-feat** command output. The specified feature must be the GSM MAP SRI Redirect or ISUP NP for EPAP feature.

The FEATPFX table cannot be full when a new entry is added.

Notes

The Prefix table contains different groups of entries based on the features that are turned on. For the GSM MAP SRI Redirect for Serving HLR feature, the entries are referenced by the VendID table, based on a Vendor Number matching a Prefix Number. For the ISUP NP with EPAP feature, the entries are referenced by the SubnetID table, based on a Subnet Number matching a Prefix Number. The Prefix table for the ISUP NP with EPAP feature also reserves Prefix Number 6 for the Insertion Country Code value, and reserves Prefix Number 7 for the Deletion Condition value. Figure 5-8 illustrates the references to the Prefix table.

Figure 5-8. Prefix Table References

* Reserved for the ISUP NP with EPAP feature Insertion Country Code value

** Reserved for the ISUP NP with EPAP feature Deletion Condition value

For the ISUP NP with EPAP feature:

- When the Insertion Country Code (prefix number 6) is defined, the following information message appears:
ISUP NP with EPAP, Insertion Country Code value is now defined
- When the Deletion Condition (prefix number 7) is defined, the following information message appears:
ISUP NP with EPAP, Deletion Condition value is now defined

Output

chg-prefix:feature="isup np with epap":prefix=1004:prefixnum=1

```
rlghncxa03w 04-09-20 09:04:14 EST EAGLE 31.11.0
CHG-PREFIX: MASP A - COMPLTD
```

;

chg-rte

Change Route

Use this command to change the “cost,” or priority of a route. The cost is based on whether this route is first choice, second choice, and so on. Prioritize routes in such a way that the most direct route (fewest intermediate signaling points) is highest priority.

Keyword: chg-rte

Related Commands: chg-dstn, dlt-dstn, dlt-rte, ent-dstn, ent-rte, rept-stat-dstn, rept-stat-rte, rtrv-dstn, rtrv-rte

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:lsn= (mandatory)

Linkset name. This parameter specifies the name of the linkset associated with the route. The linkset name must be unique.

Range: *ayyyyyyyyy*
1 alphabetic character followed by 9 alphanumeric characters

:dpc= (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: dpc

Range: **p-, 000-255, ***
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—p-
The asterisk value (*) is not valid for the *ni* subfield.
When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.
When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001–005*.
When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006–255*.
The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Destination point code.

:dpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—s-, p-, ps-
zone—0-7
area—000-255
id—0-7
The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code.

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:force= (optional)

This parameter allows **nl sn** to be same as the **il sn** in the exception routes of the destination or allows **apc** to be same as **opc** in the exception routes of the destination.

Range: **yes**

:nl sn= (optional)

New linkset name. This parameter specifies the new linkset name associated with the route.

Range: *ayyyyyyyy*

1 alphabetic character followed by 9 alphanumeric characters

Default: The current value

:rc= (optional)

Relative cost (priority) for the route. Zero (**0**) is the highest priority, **99** the lowest.

Range: **0-99**

Default: The current value

Example

```
chg-rte: lsn=rlgh03:rc=0:dpc=244-003-001
```

```
chg-rte: dpc=25-*-*:lsn=myls:rc=10
```

The following example changes route for dpcn 4085-aa using linkset e1m2itun to relative cost of 30:

```
chg-rte: dpcn=4085-aa:lsn=e1m2itun:rc=30
```

The following example changes route for dpcn2410-100-14 using linkset we123624 to a relative cost of 25:

```
chg-rte: dpcn24=10-100-14:lsn=we123624:rc=25
```

The following example changes route for private point code dpcp-1-1-1 using linkset we123642 to relative cost of 50:

```
chg-rte: dpc=p-1-1-1:lsn=we123642:rc=50
```

The following example changes route for spare point code dpcns-4085-aa using linkset e1m2itun to relative cost of 30:

```
chg-rte: dpc=s-4085-aa:lsn=e1m2itun:rc=30
```

The following example changes route for private point code dpcn24p-1-100-1 using linkset we123624 to relative cost of 25:

```
chg-rte:dpcn24=p-1-100-1:lsn=we123624:rc=25
```

The following example changes route for private and spare point code dpcips-1-104-1 using linkset e1m2itui to relative cost of 30:

```
chg-rte:dpci=ps-1-104-1:lsn=e1m2itui:rc=30
```

Dependencies

The 6-Way Loadsharing on Routesets feature must be turned on before more than 2 routes can be provisioned with the same relative cost.

If the **ipgwapc=yes** parameter is specified, then the associated **dpc/dpca/dpci/dpcn/dpcn24** parameter cannot have a cluster route assigned.

If the identity of a route is being changed because of a change in the linkset name, the database must not already contain the new linkset name and destination address.

If the **nlsn** parameter is specified, the link set must already exist in the database and at least one link must be assigned to the link set.

If a new linkset name (the **nlsn** parameter) is specified for an existing destination network address (*ni-*-**), or destination network cluster address (*ni-nc-**), the linkset type used in the route (see the **chg-ls** command) must be either **b**, **c**, or **d**.

If the specified destination address is a full point code address (*ni-nc-ncm*) and is a member of a provisioned cluster (*ni-nc-**), whether the attributes of the ordered routes assigned to the cluster can be changed is determined by the destination address's NCAI (Nested Cluster Allowed Indicator). The NCAI is set with the **ncai** parameter of the **ent/chg-dstn** commands.

- If the **ncai=no** parameter is specified, the cluster point code is not a nested cluster point code and the attributes of the ordered routes assigned to the cluster cannot be changed.
- If the **ncai=yes** parameter is specified, the specified destination address is a member of a provisioned nested cluster where the attributes of the ordered routes assigned to the cluster can be changed.

If the specified destination address is a network cluster address (*ni-nc-**), how the attributes of the specified ordered route are changed is determined by the setting of the destination address's NCAI.

- If the **ncai=no** parameter is specified, the attributes of the specified ordered route are changed for each signaling point code having the same network identifier (*ni*) and network cluster (*nc*) codes.
- If the **ncai=yes** parameter is specified, the specified destination address is a nested cluster where changing the attributes of the ordered routes for the cluster does not affect the attributes of the ordered routes of the provisioned members.

The route destination's type must match the route's linkset adjacent point code or the route's linkset secondary adjacent point code type.

Only IPGW routes are allowed for private point codes.

If the **dpcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

Network routing is valid only if the NRT feature is on. The NRT feature is turned on with the **chg-feat** command.

When using network routing, if the destination point code has a value of * in the *nc* field, the *ncm* field must also be * (for example, **dpc=21-*-***).

At least one of the following optional parameters must be specified: **nda**, **nz nlsn**, and **nrc**.

The current destination address must be a full or a cluster point code.

All linksets that are currently assigned to a route set must still be equipped.

The linkset specified by the **lsn** parameter must exist in the routeset of the destination table entry.

If a new link set (**nlsn** parameter) is specified in the command, that link set name must exist in the active LINK SET entity.

The specified DPC must be in the database.

Only a single route is allowed for an APC or SAPC for an IPGWx linkset. The changed route must include the APC or SAPC's IPGWx linkset with the destination equal to the APC or SAPC.

The adjacent point code must match the destination point code type (Obsolete in IP7 3.0)

The STP shall ensure that the ITU-N ordered route destination's group code must match the route's Link Set Adjacent PC's group code for all linksets other than IPGWI and IPLIMI. (obsolete in IP7 4.0)

If a proxy linkset is used, then the **nlsn** parameter cannot be specified.

If a proxy linkset is used, then the value specified for the **dpc** parameter cannot be a network cluster address (*ni-nc-**) or network address (*ni-*-**).

The network type of the routeset must be same as the network type of the destination point code.

The value specified for the **rc** parameter must differ from the original routing cost of the associated linkset.

If the value specified for the **dpc** parameter refers to a Proxy Point Code in the Destination table, then the **nlsn** parameter cannot be specified.

Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

Output

```
chg-rtx: lsn=r1gh03:rc=0:dpc=244-003-001

```

chg-rtx

Change Exception Route

Use this command to change an exception route entry in the Routing table.

Keyword: chg-rtx

Related Commands: dlt-rtx, ent-rtx, rept-stat-rtx, rtrv-rtx

Command Class: Database Administration

Parameters

At least one of the following optional parameters must be specified: **opc**, **ilsn**, **si**, or **cic**.

:dpc= (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: dpc

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (mandatory)

Destination point code.

:dpci= (mandatory)

Destination Point Code. ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (mandatory)

Destination Point Code. ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUPUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (mandatory)

Destination Point Code. 24-bit ITU national point code with subfields *main signaling area-subsignaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:lsn= (mandatory)

Linkset name. This parameter specifies the name of the linkset associated with the specified exception route.

Range: *ayyyyyyyyy*
1 alphabetic character followed by up to 9 alphanumeric characters.

:cic= (optional)

Starting Circuit Identification Code. This parameter is used alone or together with the **ecic** parameter as exception routing criteria for the specified exception route.

Range: **1-16383**

:ecic= (optional)

Ending Circuit Identification Code. This parameter, together with the **cic** parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

Range: **0-16383**

:force= (optional)

The **force=yes** parameter must be specified when the **ilsn** parameter value is the same as the **nlsn** parameter value.

Range: **yes**

:ilsn= (optional)

Incoming linkset name. This parameter specifies the name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

Range: *ayyyyyyyyy*
1 alphabetic character followed by up to 9 alphanumeric characters.

:nlsn= (optional)

New linkset name. This parameter specifies the linkset name that replaces the linkset name associated with the specified exception route.

Range: *ayyyyyyyyy*
1 alphabetic character followed by up to 9 alphanumeric characters.

:opc= (optional)

ANSI origination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range: **p-, 000-255**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—p-
When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.
When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.
When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.
The point code **000-000-000** is not a valid point code.

:opc/opca/opci/opcn/opcn24= (optional)

Originating Point Code

:opci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-
zone—0-7
area—000-255
id—0-7

The point code **0-000-0** is not a valid point code.

:opcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfmt** flexible point code option. A group code must be specified when the ITUPUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The prefix subfield indicates a spare point code, private point code or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-
nnnnn—0-16383
gc—aa-zz
m1-m2-m3-m4—0-14 for each member; values must sum to 14

:opcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-subsignaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-
msa—000-255
ssa—000-255
sp—000-255

:rc= (optional)

Relative cost. This parameter specifies the relative cost associated with the specified exception route.

Range: 0-99

:si= (optional)

Service indicator. This parameter is used as part of the exception routing criteria for the specified exception route.

Range: 3-15

Example

This example changes the relative cost of an existing exception route.

```
chg-rtx:dpca=1-1-1:opca=2-3-3:lsn=1set1:rc=30
```

This example changes the linkset associated with the exception route.

```
chg-rtx:dpca=1-2-1:si=3:lsn=1set2:nlsn=1set3
```

This example changes the linkset and relative cost of the exception route.

```
chg-rtx:dpca=1-3-1:ilsn=1set2:lsn=1set3:nlsn=1set4:rc=20
```

```
chg-rtx:dpci=2-100-1:ilsn=1set2:lsn=1set4:rc=10
```

```
chg-rtx:dpci=2-100-1:si=5:lsn=1set5:rc=50
```

Dependencies

Only one of the **opc**, **ilns**, **cic**, or **si** parameters can be specified for a exception route entry.

If the **ecic** parameter is specified, the **cic** parameter must be specified.

The **ecic** parameter value cannot be less than the **cic** parameter value.

The **opc/opca/opci/opcn/opcn24** parameter value cannot be the same as the **dpc** parameter value.

The Origin-Based MTP Routing feature must be turned on before this command can be entered.

The specified combination of exception route parameter conditions must already exist.

The linkset name, as defined by the **ilns**, **lsn**, or **nlsn** parameter, must exist.

The 6-Way Loadsharing on Routesets feature must be turned on before more than 2 routes can be provisioned with the same relative cost for a given exception route criteria.

The network domain of the adjacent point code in the linkset or in the routes in the specified routeset must be the same as the network domain of the specified destination point code or its alias.

The APC/SAPC type and group code in the linkset specified by the **lsn** parameter must match the value specified by the **dpc**, **dpca**, **dpci**, **dpcn** or **dpcn24** parameter.

The **nlsn** parameter value cannot be the same as the **lsn** parameter value.

Either the **nlsn** parameter, the **rc** parameter, or both parameters must be specified.

The value specified for the destination point code must be a full point code and not a cluster or network point code.

The point code specified by the **dpc**, **dpca**, **dpci**, **dpcn**, or **dpcn24** parameter must exist in the destination table.

If the **ilns** and **lsn** parameter have the same value, or if the value specified for the **opc/opca/opci/opcn/opcn24** parameter is the same as the APC of the linkset specified by the **lsn** parameter, then the **force=yes** parameter must be specified.

The route cost specified by the **rc** parameter must differ from the existing route cost for the linkset specified by the **lsn** parameter.

The route associated with the linkset specified by the **lsn** parameter must already exist in the specified exception route.

The route associated with the linkset specified by the **nlsn** parameter cannot already exist in the specified exception route.

The value specified for **opc/opca/opci/opcn/opcn24** parameters cannot be the same as the adjacent point code of the linkset specified by the **lsn** parameter.

Output

```
chg-rtx: dpca=1-1-1 : opc=2-3-3 : lsn=1set1 : rc=30
stdcfg2b 06-05-19 18:20:11 EST EAGLE 35.0.0
CHG-RTX: MASP A - COMPLTD
```

chg-sccp-msg

Change SCCP Message

Use this command to revise an SCCP message.

Keyword: **chg-sccp-msg**

Related Commands: **rtrv-sccp-msg**, **tst-msg**

Command Class: Database Administration

Parameters

NOTE: The nature of address indicator, numbering plan, and TCAP package indicator can be specified by mnemonic or numeric values (cdnai/cdnaiv, cdnp/cdnpv, and tcappkg/tcappkgv respectively).

:msgn= (mandatory)

Message number. This parameter specifies the number of the SCCP message.

Range: 1-10

:active= (optional)

This parameter specifies whether the SCCP message should be sent to the network card for processing.

Range: yes, no

yes — The message is sent to the network card.

no — The message is not sent to the network card.

Default: yes

:cdgta= (optional)

CdPA GTA. This parameter specifies the Called Party Address for the SCCP message.

Range: 1-15 digits

1 - 15 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.

Default: 1234567890

:cdgti= (optional)

CdPA GTI. This parameter specifies the Called Party Global Title Indicator for the SCCP message.

Range: 0-4

:cdnai= (optional)

CdPA NAI. This parameter specifies the Called Party Nature of Address Indicator for the SCCP message.

Range: sub, rsvd, natl, intl

Default: sub

:cdnaiv= (optional)

CdPA NAI V. This parameter specifies the Called Party Nature of Address Indicator Value for the SCCP message.

Range: 0-127

Default: 1

:cdnp= (optional)

CdPA NP. This parameter specifies the Called Party Numbering Plan for the SCCP message.

Range: e164, generic, x121, f69, e210, e212, e214, private

Default: e164

:cdnpv= (optional)

CdPA NP V. This parameter specifies the Called Party Numbering Plan Value for the SCCP message.

Range: 0-15

Default: 1

:cdpc= (optional)

ANSI Called Party point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

Default: **10-10-10** - ANSI 10-10-10

:cdpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:cdpcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:cdpcn24= (optional)

24-bit ITU national CdPA point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:cdssn= (optional)

CdPA SSN. This parameter specifies the Called Party Subsystem Number for the SCCP message.

Range: **0-255 none**

Default: **6**

- :cdtt=** (optional)
CdPA TT. This parameter specifies the Called Party Translation Type for the SCCP message.
Range: 0-255
Default: 0
- :cgta=** (optional)
CgPA GTA. This parameter specifies the Calling Party Address for the SCCP message.
Range: 1-15 digits
Range is 1 - 15 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
Default: 1234567890
- :cggti=** (optional)
CgPA GTI. This parameter specifies the Calling Party Global Title Indicator for the SCCP message.
Range: 0-4
- :cgnai=** (optional)
CgPA NAI. This parameter specifies the Calling Party Nature of Address Indicator for the SCCP message.
Range: sub, rsvd, natl, intl
- :cgnaiv=** (optional)
CgPA NAIIV. This parameter specifies the Calling Party Nature of Address Indicator Value for the SCCP message.
Range: 0-127
Default: 1
- :cgnp=** (optional)
CgPA NP. This parameter specifies the Calling Party Numbering Plan for the SCCP message.
Range: e164, generic, x121, f69, e210, e212, e214, private
- :cgnpv=** (optional)
CgPA NPV. This parameter specifies the Calling Party Numbering Plan Value for the SCCP message.
Range: 0-15
Default: 1
- :cgpc=** (optional)
ANSI CGPA point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).
Range: p-, 000-255
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—p-
When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.
When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.
When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.
The point code **000-000-000** is not a valid point code.
Default: 20-20-20 - ANSI 20-20-20
- :cgpci=** (optional)
ITU international CgPA point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).
Range: s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:cgpcn= (optional)

ITU national CgPA point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:cgpcn24= (optional)

24-bit ITU national CgPA point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:cgssn= (optional)

CgPA SSN. This parameter specifies the Calling Party Subsystem Number for the SCCP message.

Range: **0-255 none**

Default: **8**

:cgtt= (optional)

CgPA TT. This parameter specifies the Calling Party Translation Type for the SCCP message.

Range: **0-255**

Default: **0**

:dpc= (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **dpca**

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.

The point code **000-000-000** is not a valid point code.

Default: 20-20-20 - ANSI 20-20-20

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Point Code.

:dpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:dpcn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

msa—000-255

ssa—000-255

sp—000-255

:eaglegen= (optional)

This parameter specifies whether the message is an EAGLE 5 ISS generated message.

Range: no, yes

no— the message is not an EAGLE 5 ISS generated message

yes — the message is an EAGLE 5 ISS generated message

:lsn= (optional)

Linkset name. This parameter specifies the incoming linkset name for the SCCP message.

Range: *ayyyyyyyyy*
1 alphabetic character followed by up to 9 alphanumeric characters

:opc= (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Range: **p-, 000-255**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—p-
When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.
When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.
When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.
The point code **000-000-000** is not a valid point code.

Default: **10-10-10** - ANSI 10-10-10

:opci= (optional)

ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—s-, p-, ps-
zone—0-7
area—000-255
id—0-7
The point code **0-000-0** is not a valid point code.

:open= (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—s-, p-, ps-
nnnnn—0-16383
gc—aa-zz
m1-m2-m3-m4—0-14 for each member; values must sum to 14

:open24= (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p**

msa—**000–255**

ssa—**000–255**

sp—**000–255**

:selid= (optional)

Selector ID. This parameter specifies the Selector ID used in the first GTT selector search.

Range: **0-65534**

:tcapacn= (optional)

TCAP application context name. This parameter specifies the ITU TCAP *acn* field in the incoming MSU.

Range: **0-255 none**

The *acn* field supports up to 7 subfields separated by a dash (e.g., *1-202-33-104-54-26-007*).

none—there is no ITU TCAP *acn* field in the incoming MSU

:tcapfamily= (optional)

This parameter specifies the ANSI TCAP *family* field in the incoming MSU.

Range: **0-255 none**

none—there is no ANSI TCAP *family* field in the incoming MSU

:tcapopcode= (optional)

This parameter specifies the TCAP *opcode* field in the incoming MSU.

Range: **0-255 none**

none—there is no TCAP *opcode* field in the incoming MSU

:tcappkg= (optional)

TCAP package. This parameter specifies the ANSI TCAP and ITU TCAP package type.

Range: **ituuni, qwop, qwop, resp, cwp, cwop, bgn, end, cnt, ituabort, ansiabort, ansiuni, none**

ituuni, none — ITU unidirectional

qwop, none — Query with Permission

qwop, none — Query without Permission

resp, none — Response

cwp, none — Conversation with Permission

cwop, none — Conversation without Permission

bgn, none — Begin

end, none — End

cnt, none — Continue

ituabort, none — ITU abort

ansiabort, none — ANSI abort

ansiuni, none — ANSI unidirectional

ANSI TCAP Package Types—**ansiuni, qwop, qwop, resp, cwp, cwop, ansiabort**

ITU TCAP Package Types—**bgn, ituabort, ituuni, end, cnt**

:tcappkgv= (optional)

TCAP package value. This parameter specifies the TCAP package type value.

Range: **0-255**

Example

chg-sccp-msg:msgn=1:cgtt=4:cdnp=generic:eaglegen=yes:cdpc=2-2-2

```
chg-sccp-msg:msgn=3:cdgta=324ab12:cdtt=6:cdnaiv=3:cgnai=rsvd
chg-sccp-msg:msgn=5:cdtt=10:opc=4-5-6:cgpcn=1234
chg-sccp-msg:msgn=1:tcappkg=bgn:tcapopcode=34
chg-sccp-msg:msgn=1:cdtt=12:dpci=1-101-1:cgpci=1-101-2
```

Dependencies

At least one optional parameter must be specified.

The **cdnp** and **cdnpv** parameters and the **cgnp** and **cgnpv** parameters cannot be specified together in the command.

The **cdnai** and **cdnaiv** parameters and the **cgnai** and **cgnaiv** parameters cannot be specified together in the command.

A TOBR quantity feature must be turned on before the **tcapacn**, **tcappkg**, **tcappkgv**, **tcapopcode**, or **tcapfamily** parameter can be specified.

The **tcappkg** and **tcappkgv** parameters cannot be specified together in the command.

The values **1** and **3** cannot be specified for the **cdgti** and **cggti** parameters.

The GTT feature must be turned on before this command can be entered.

Notes

None

Output

```
chg-sccp-msg:msgn=1:tcapacn=7-8-9-0
tekelecstp 09-03-02 16:07:33 EST EAGLE 41.0.0
Command entered at terminal #4.
CHG-SCCP-MSG: MASP A - COMPLTD
;
```

chg-sccp-serv

Change SCCP Service

Use this command to:

- Change the state of G-Flex and G-Port services to online or offline. Taking a service offline shifts the processing load to designated nodes.
- Add PCs to an existing service group for service re-route assignment, or change the relative cost (RC) of existing point codes in a group.

Keyword: **chg-sccp-serv**

Related Commands: **dlt-sccp-serv**, **rtrv-sccp-serv**

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:serv= (mandatory)

Service. This parameter specifies the name of the service.

Range: **gflex**, **gport**, **mnp**

gflex — G-Flex (GSM Flexible Numbering)

gport — G-Port (GSM Mobile Number Portability)

mnp — Mobile Number Portability

:gtt= (optional)

GTT option indicator. This parameter specifies whether to use GTT as part of the re-routing procedure when the service is offline, and alternate PCs are not defined or not available.

Range: **no, yes**

no — Do not use GTT as part of the re-routing procedure.

yes — Use GTT as part of the re-routing procedure.

Default: **yes**

:pc1= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **pca1**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:pc1/pca1/pci1/pcn1/pcn241= (optional)

Alternate post-GTT-translated point code.

:pc2= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **pca2**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:pc2/pca2/pci2/pcn2/pcn242= (optional)

Alternate post-GTT-translated point code.

:pc3= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **pca3**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:pc3/pca3/pci3/pcn3/pcn243= (optional)

Alternate post-GTT-translated point code.

:pc4= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca4

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.

The point code **000-000-000** is not a valid point code.

:pc4/pca4/pci4/pcn4/pcn244= (optional)

Alternate post-GTT-translated point code.

:pci1= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pci2= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pci3= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pci4= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pcn1= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn2= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn241= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000–255**

ssa—**000–255**

sp—**000–255**

:pcn242= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000–255**

ssa—**000–255**

sp—**000–255**

:pcn243= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000–255**

ssa—**000–255**

sp—**000–255**

:pcn244= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000–255**

ssa—**000–255**

sp—**000–255**

:pcn3= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn4= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:rc1= (optional)

Relative cost 1. This parameter specifies the relative cost of the route for alternate post-GTT-translated point code 1.

Range: **0-99**

:rc2= (optional)

Relative cost 2. This parameter specifies the relative cost of the route for alternate post-GTT-translated point code 2.

Range: **0-99**

:rc3= (optional)

Relative cost 3. This parameter specifies the relative cost of the route for alternate post-GTT-translated point code 3.

Range: **0-99**

:rc4= (optional)

Relative cost 4. This parameter specifies the relative cost of the route for alternate post-GTT-translated point code 4.

Range: **0-99**

:state= (optional)

This parameter specifies the state of the service.

Re-routing is performed when the service state is **offline**.

Range: **offline, online**

Default: **offline**

Example

```
chg-sccp-serv: serv=gport: state=online
```

```
chg-sccp-
```

```
serv: serv=gport: pca1=1-1-1: rc1=10: pca2=2-2-2: rc2=20: pca3=3-3-3: rc3=30: pca4=4-4-4: rc4=40
```

```
chg-sccp-serv: serv=gport: pci1=2-2-2: rc1=10: pci2=3-3-3: rc2=10
```

```
chg-sccp-serv: serv=gport: state=online: gtt=yes
```

Dependencies

The specified point code network type must match an existing point code network type.

The point code and relative cost parameter values must be specified together as a pair in the command.

The point code cannot match the existing site identification true point code.

The mate remote point code must already exist as destination in the Ordered Route entity set or reside in a cluster destination for which ordered routes are specified.

The SCCP Service table cannot be full when the command is entered. For each supported service (G-Port and G-Flex), up to 7 point codes can be specified for each network type (ANSI, ITU-I, S-ITU-I, ITU-N, S-ITU-N, and ITU-N24).

A maximum of 7 point codes can be allocated to a group or SCCP Service set.

The A-Port or IGM feature, G-Flex feature, and G-Port feature must be enabled before the **serv=mnp**, **serv=gflex**, and **serv=gport** parameter can be specified, respectively.

If the A-Port or IS41 GSM Migration (IGM) feature is enabled, the **serv=gport** parameter cannot be specified.

The A-Port or IGM feature must be enabled before the **serv=mnp** parameter can be specified.

At least one optional parameter must be specified.

At least one PC/RC pair (for example, the **pc1** and **rc1** parameters) must be specified.

The mated point code must be a full point code.

Each new point code (specified by the **pc1**, **pc2**, **pc3** or **pc4** parameter) must already exist in the destination table. See the **ent-dstn** command.

The same point code value cannot be entered more than once in the SCCP-SERV table.

New and existing point codes cannot be entered together in the same command.

The specified MRN set must already exist in the MRN table for the SCCP-SERV table.

If the Flexible GTT Loadsharing feature is enabled, the specified point code must already exist in the specified SCCP-SERV set in the MRN table.

Notes

The SCCP Service table is part of the MRN table.

When using **chg-sccp-serv** to modify relative cost values, all of the point codes that are specified in one command must exist in the same group in the SCCP-SERV table.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

This command supports the assignment of point codes to SCCP Service point code groups used for service re-route assignment. It is used to add point codes to a service group or to change the relative cost (RC) of existing point codes in a service group.

SCCP Service groups are organized by service (G-Flex or G-Port) and PC network type (ANSI, ITU-I, Spare ITU-I, ITU-N, Spare ITU-N, or ITUN-24). Up to 7 point codes can be in a network type grouping for service re-route load sharing. Up to 4 point codes can be added or modified in one command.

The **-sccp-serv** commands differ from the **-mrn** commands in that the service name (**serv** parameter) is required instead of an existing PC in the set serving as the key.

When using **chg-sccp-serv** to add new point codes, none of the point codes that are specified in one command can exist in the group in the SCCP-SERV table and must all be added to the same SCCP-SERV group.

Output

The following example changes the SCCP service for G-Port to provision the point code and relative cost values:

```
chg-sccp-serv: serv=gport: pca1=1-1-1: rc1=10: pc2=1-1-2: rc2=20
tekelecstp 05-12-20 08:35:15 EST 35.0.0
CHG-SCCP-SRV : MASP A - COMPLTD
;
```

chg-sccpopts**Change SCCP Options**

Use this command to change the values of one or more of the SCCP option indicators maintained in the STP options table.

Keyword: **chg-sccpopts**

Related Commands: **rtrv-sccpopts**

Command Class: Database Administration

Parameters

NOTE: As of Release 42.0, the **dfltcgpcasn** and **dfltcgpcisn** parameters are obsolete.

:aclen= (optional)

Area code length. This parameter specifies the length of the area code.

This parameter is used with the CgPN.

Range: **0-8**

Default: No change to the current value

System **0** - If the **aclen** parameter was provisioned in the **chg-tifo** command, then the value

Default: from the **chg-tifo** command is used as the initial value for the **aclen** parameter in the **chg-sccpopts** command.

:cclen= (optional)

Country code length. This parameter specifies the length of the country code.

This parameter is used with the CgPN.

Range: **0-3**

Default: No change to the current value

System

Default: **0**

:class1seq= (optional)

This parameter enables or disables Class 1 message sequencing.

Range: **on, off**

on—Enabled; Class 1 messages are guaranteed to be sequenced, but the messages are not load shared.

off—Disabled; Class 1 message sequencing is not guaranteed, but the messages might be load shared (if appropriate configuration exists).

Default: Current value

System

Default: **off**

:cnvainat= (optional)

This parameter specifies the value of the called party/calling party address Reserved for National Use bit during SCCP conversion when global title translation routes the message to the ITU national network.

Range: **0, 1**

0— The Reserved for National Use bit is not reserved for national use.

1 — The Reserved for National Use bit is reserved for national use.

Default: No change to the current value

System

Default: 1

:delccprefix= (optional)

This parameter specifies how to apply the DELCCPREFIX digit action to a Called Party Global Title Address (CdPA GTA).

Range: **pxfwcc, pfx4all**

pxfwcc — Apply the DELCCPREFIX digit action to the CdPA GTA only when the address has a International format. If this option is selected, then the Country Code is deleted and the GTA is prefixed with the Entity Id.

pfx4all — Apply the DELCCPREFIX digit action to the CdPA GTA in all cases. If this option is selected, then for an International format, the Country Code is deleted and the GTA is prefixed with the Entity Id. For a National format, the GTA is prefixed with the Entity ID.

Default: No change to the current value

System

Default: pfwxwcc

:dfltfallback= (optional)

Default fallback option. This parameter specifies the action that is taken if the last translation doesn't match when performing GTT using a FLOBR-specific GTT mode.

Range: **no, yes**

no — GTT fails and the MSU is discarded

yes — GTT is performed based on the last matched entry

Default: No change to the current value

System

Default: no

:dfltgttmode= (optional)

Default GTT mode. This parameter specifies the system default value of the GTT mode hierarchy used by the EAGLE 5 ISS when performing GTT.

Range: **acdcd, acdegcd, acdcdcg, cd, cdcg, cg, cged, cgacdcd, fcd, fcg, fcgfd, fcdfcg**

acdcd — Advanced CdPA GTT, CdPA GTT

acdegcd — Advanced CdPA GTT, CgPA GTT, CdPA GTT

acdcdcg — Advanced CdPA GTT, CdPA GTT, CgPA GTT

cd — CdPA GTT only

cdcg — CdPA GTT, CgPA GTT

cg — CgPA GTT only

cged — CgPA GTT, CdPA GTT

cgacdcd — CgPA GTT, Advanced CdPA GTT, CdPA GTT

fcd — FLOBR CdPA only

fcg — FLOBR CgPA only

fcgfd — FLOBR CgPA, FLOBR CdPA

fcdfcg — FLOBR CdPA, FLOBR CgPA

:gmstcapce= (optional)

This parameter enables and disables the processing of GSM Map Screening for TCAP_Continue and TCAP_End messages.

Range: **on, off**

on — Enables GSM Map Screening for TCAP_Continue and TCAP_End messages

off — Disables GSM Map Screening for TCAP_Continue and TCAP_End messages

:intlunknai= (optional)

This parameter specifies whether International NAIs (**nai=intl**) are included in Unknown NAIs (**nai=unkn**) and should be considered for country code CgPN (**ccgpn**) conditioning.

Range: **no, yes**

Default: No change to the current value

System

Default: **no**

:mobrscpopc= (optional)

This parameter specifies the OPC that is derived from the SCCP message that is used as an exception class.

Range: **sccp, mtp, tpc**

sccp— The OPC exception class uses the point code within the CGPA, if the CGPA portion of the message is "route-on-dpcsn". If the option is "route-on-gt", the **sccp** option is not used and defaults to the **mtp** option.

mtp— The OPC exception class uses the original MTP OPC value as its criteria.

tpc— The OPC exception class uses the EAGLE 5 ISS true point code for the criteria.

:mtprgtt= (optional)

This parameter specifies whether GTT is performed on an MTP-routed MSU and the routing that is performed on the MSU after GTT.

Range: **off, usemtpc, fullgtt**

off— GTT is not performed

usemtpc— GTT is performed and the MSU is then routed to the original DPC

fullgtt— GTT is performed and the MSU is then routed to a translated DPC

Default: No change to the current value

System

Default: **off**

:mtprgttfallbk= (optional)

This parameter specifies whether an MTP-routed MSU is MTP-routed after GTT failure.

Range: **mtproute, gttfail**

mtproute— perform MTP routing on the MSU if a failure occurs during GTT

gttfail— discard the MSU if a failure occurs during GTT. Send UDTS if required.”

Default: No change to the current value

System

Default: **mtproute**

:subdfrn= (optional)

This parameter specifies whether S-Port Subscriber Differentiation is performed.

Range: **on, off**

on— perform S-Port Subscriber Differentiation

off— do not perform S-Port Subscriber Differentiation

Default: No change to the current value

System

Default: **off**

:tgtt0= (optional)

This parameter enables or disables transaction-based GTT loadsharing for SCCP Class0 UDT, Class0 XUDT, UDTS, and XUDTS messages.

Range: **udt, xudt, both, none**

udt, none— Enables transaction-based GTT loadsharing for UDTS and Class0 UDT messages.

xudt, none— Enables transaction-based GTT loadsharing for XUDTS and Class0 XUDT messages.

both, none— Enables transaction-based GTT loadsharing for UDTS, XUDTS, Class0 UDT, and Class0 XUDT messages.

none— Disables transaction-based GTT loadsharing for UDTS, XUDTS, Class0 UDT, and Class0 XUDT messages.

Default: No change to current value

System

Default: none

:tgtt1= (optional)

This parameter enables or disables transaction-based GTT loadsharing for SCCP Class1 UDT, Class1 XUDT, UDTS, and XUDTS messages.

Range: **udt, xudt, both, none**

udt, none— Enables transaction-based GTT loadsharing for UDTS and Class1 UDT messages.

xudt, none— Enables transaction-based GTT loadsharing for XUDTS and Class1 XUDT messages.

both, none— Enables transaction-based GTT loadsharing for UDTS, XUDTS, Class1 UDT, and Class1 XUDT messages.

none— Disables transaction-based GTT loadsharing for UDTS, XUDTS, Class1 UDT, and Class1 XUDT messages.

Default: No change to current value

System

Default: none

:tgttudtkey= (optional)

This parameter specifies the transaction parameter for incoming UDT(S) messages. Messages with this parameter are routed to the same load-shared PC within a MAPGROUP or MRNGROUP.

Range: **mtp, tcap, sccp, enhmtp**

mtp— Transaction-based GTT loadsharing is performed using the mtp algorithm

tcap— Transaction-based GTT loadsharing is performed using the tcap algorithm

sccp— Transaction-based GTT loadsharing is performed using the sccp algorithm

enhmtp— Transaction-based GTT loadsharing is performed using the enhanced mtp algorithm

Default: No change to current value

System

Default: mtp

:tgttxudtkey= (optional)

This parameter specifies the transaction parameter for incoming XUDT(S) messages. Messages with this parameter are routed to the same load-shared PC within a MAPGROUP or MRNGROUP.

Range: **mtp, sccp, enhmtp**

mtp— Transaction-based GTT loadsharing is performed using the mtp algorithm

sccp— Transaction-based GTT loadsharing is performed using the sccp algorithm

enhmtp— Transaction-based GTT loadsharing is performed using the enhanced mtp algorithm

Default: No change to current value

System

Default: mtp

:unqgttsel= (optional)

This parameter specifies whether a GTT Selector search is performed on overlapped selectors.

Range: **bestmatch, exactmatch**

bestmatch— search overlapped GTT selectors if non-overlapped GTT selectors are not found

exactmatch — search only non-overlapped GTT selectors

:dfltcgpcasn= (obsolete)

Default calling party ANSI point code set name. This parameter specifies the system default of the GTT calling party point code set for ANSI when the **gti=0** parameter is in the incoming MSU.

Range: *aaaaaaaa*, **none**

none—Removes the provisioned CgPA PC set.

:dfltcgpcisn= (obsolete)

Default calling party ITU point code set name. This parameter specifies the system default of the GTT calling party point code set for ITU when the **gti=0** parameter is in the incoming MSU.

Range: *aaaaaaaa*, **none**

1 leading alphabetic character and up to 8 following alphanumeric characters.

none—Removes the provisioned CgPA PC set.

Example

```
chg-sccpopts: class1seq=on
chg-sccpopts: mobrscpopc=sccp
chg-sccpopts: tgtt0=udt
chg-sccpopts: tgtt1=xudt
chg-sccpopts: tgttudtkey=mtp
chg-sccpopts: tgtxudtkey=sccp
chg-sccpopts: cclen=1:aclen=3
chg-sccpopts: dfltfallback=yes
chg-sccpopts: dfltgttmode=fcd
chg-sccpopts: mtprgttfallbk=gttfail
chg-sccpopts: unqgtttsel=exactmatch
```

Dependencies

At least one optional parameter must be specified.

The Origin-based MTP Routing feature must be turned on before the **mobrscpopc** parameter can be specified.

The Origin-based SCCP Routing feature must be turned on before the **dfltgttmode** parameter can have a value of **acdd**, **cgacdd**, **acdcgd**, **acdcgdg**, **cgcd**, **cdcg**, or **cg**.

The Transaction-based GTT Loadsharing feature must be enabled before the **tgtt0**, **tgtt1**, **tgttudtkey**, or **tgtxudtkey** parameters can be specified.

The GSM Map Screening feature must be turned on before the **gmstcapce** parameter can be specified.

The ANSI/ITU SCCP Conversion feature must be enabled before the **cnvainat** parameter can be specified.

The FLOBR feature must be turned on before the **dfltgttmode** parameter can have a value of **fcd**, **fcg**, **fcgfd**, or **fcdfcg** and before the **dfltfallback** parameter can be specified.

The MTP routed messages for SCCP Applications feature or the GWS Stop Action SCCP feature must be enabled before the **mtprggt** or **mtprggtfallbk** parameter can be specified.

The S-Port Subscriber Differentiation feature must be enabled and turned on before the **subdfn** parameter can be specified.

Notes

None.

Output

```

chg-sccpopts:mtprgtt=usemtpc
tekelecstp 10-02-10 20:09:11 EST EAGLE 42.0.0
chg-sccpopts:mtprgtt=usemtpc
Command entered at terminal #4.
CHG-SCCPOPTS: MASP A - COMPLTD
;

```

chg-scr-aftpc**Change Allowed Affected Point Code**

Use this command to change the attributes of a specific screening reference in the allowed affected point code category. Attributes that can be changed are the point code and the subsystem number.

Keyword: **chg-scr-aftpc**

Related Commands: **dlt-scr-aftpc**, **ent-scr-aftpc**, **rtrv-scr-aftpc**

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*
1 alphabetic character followed by up to 3 alphanumeric characters

:ssn= (mandatory)

Subsystem number. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:actname= (optional)

Action name. This parameter specifies the name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see the **chg-gws-actset** and **rtrv-gws-actset** commands).

Range: *ayyyyy*, **none**
1 alphabetic character followed by up to 5 alphanumeric characters.
none—Remove an existing gateway screening stop action set from a gateway screening rule.

:area= (optional)

ITU international area. This parameter specifies the *area* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:id= (optional)

ITU international ID. This parameter specifies the *ID* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7 ***

:msa= (optional)

24-bit ITU-national main signaling area value. This parameter specifies the *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:narea= (optional)

New ITU-international area value. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *
Default: No change to the current value

:nc= (optional)

Network cluster value. This parameter specifies one or more **nc** values for the network indicator and network cluster member values specified by the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 0-255.

Range: 0-255 *

:ncm= (optional)

Network cluster member value. This parameter specifies one or more **ncm** values for the network indicator and network cluster values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 0-255.

Range: 0-255 *

:ni= (optional)

Network indicator value. This parameter specifies one or more **ni** values for the network cluster and network cluster member values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 0-255.

Range: 0-255 *

:nid= (optional)

New ITU-international ID value. An asterisk (*) indicates the full range of values from 0-7.

Range: 0-7 *

Default: No change to the current value

:nmsa= (optional)

New 24-bit ITU-national main signaling area value. This parameter specifies the new *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 0-255.

Range: 0-255 *

:nnc= (optional)

New network cluster. This parameter specifies one or more **nnc** values for the screening reference specified in the **sr** parameter. It specifies the new *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 0-255.

Range: 0-255 *

Default: No change to the current value

:nncm= (optional)

New network cluster member. This parameter specifies one or more **ncm** values for the screening reference specified in the **sr** parameter. It specifies the new *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 0-255.

Range: 0-255 *

Default: No change to the current value

:nni= (optional)

New network identifier. This parameter specifies one or more **nni** values for the screening reference specified in the **sr** parameter. It specifies the new *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 0-255.

Range: 0-255 *
Default: No change to the current value

:npc= (optional)

New ITU-national point code. An asterisk (*) indicates the full range of values from 0-16383.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you use multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: 0-16383 *
Default: No change to the current value

:npc= (optional)

ITU national point code. An asterisk (*) indicates the full range of values from 0-16383.

Range: 0-16383 *

:npct= (optional)

New point code subtype. This parameter indicates whether the specified new ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process. This halts the gateway screening process, and the message then proceeds through normal routing.

Range: stop

Default: No change to the current value

:nsp= (optional)

New 24-bit ITU national signaling point. This parameter specifies the new *sp* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 0-255.

Range: 0-255 *

:nsr= (optional)

Next screening reference. This parameter specifies which screening reference in the specified screening category (**nsfi**) is to be used in the screening process.

Range: ayy

1 alphabetic character followed by up to 3 alphanumeric characters

Default: No change to the current value

:nssa= (optional)

New 24-bit ITU national sub signaling area. This parameter specifies the new *ssa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 0-255.

Range: 0-255 *

:nssn= (optional)

New subsystem number. An asterisk (*) indicates the full range of values from 0-255.

Range: 0-255 *

Default: No change to the current value

:nzone= (optional)

New ITU-international zone. This parameter specifies a new *zone* for the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from 0-7.

Range: 0-7, *

Default: No change to the current value

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:sp= (optional)

24-bit ITU national signaling point. This parameter specifies the *sp* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *

:ssa= (optional)

24-bit ITU national sub signaling area. This parameter specifies the *ssa* in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *

:zone= (optional)

ITU international zone. This parameter specifies the *zone* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: 0-7, *

Example

```
chg-scr-
```

```
aftpc:sr=iec:ni=240:nc=010:ncm=010:ssn=254:nni=240:nnc=003:nncm=030:nssn=253
```

```
chg-scr-
```

```
aftpc:sr=iec:ni=240:nc=008:ncm=203:nssn=253:nsfi=stop:actname=copy
```

```
chg-scr-
```

```
aftpc:sr=aft1:zone=1:area=2:id=3:nsfi=stop:ssn=1:pcst=s:npcst=none
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gws=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

A complete point code must be specified, and must be one, and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

At least one optional parameter must be specified.

The new affected point code and subsystem number to be changed cannot already exist in the affected point code entity set.

The **actname** parameter value must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

If the **zone=*** parameter is specified, the **area=*** and **id=*** parameters must be specified.

If the **area=*** parameter is specified, the **id=*** parameter must be specified.

If the **msa=*** parameter is specified, the **ssa=*** and **sp=*** parameters must be specified.

If the **ssa=*** parameter is specified, the **sp=*** parameter must be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc=*** parameter is specified, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **nsfi** parameter is specified, the parameter value must be **stop**.

If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

The character **c** is not a valid value for the **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, and **npc** parameters.

The Gateway Screening Rules table can contain a maximum of 372,600 rules.

The specified screening reference (**sr**) must already exist in the database.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** and **npcst** parameters cannot be specified for ANSI and ITU-N24 point codes.

The affected point code and subsystem number to be changed must already exist in the affected point code entity set.

Notes

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

An asterisk cannot be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-aftpc** command.

If the screen set reaches 100% capacity (indicated by the “100% full” message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to the card. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

A screening reference is assigned to screen sets using the **ent-scrset** command. A screening reference can belong to multiple screen sets.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
chg-scr-
aftpc: sr=iec: ni=240: nc=010: ncm=010: ssn=254: nni=240: nnc=003: nncm=0

chg-scr-blkdpc**Change Blocked DPC**

Use this command to change the attributes of a specific screening reference in the blocked DPC category. Attributes that can be changed are the blocked destination point code, next screening function identifier, and the next screening reference.

Keyword: **chg-scr-blkdpc**

Related Commands: **dlt-scr-blkdpc**, **ent-scr-blkdpc**, **rtrv-scr-blkdpc**

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

Action name. This parameter specifies the name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*, **none**

1 alphabetic character followed by up to 5 alphanumeric characters.

none—Remove an existing gateway screening stop action set from a gateway screening rule.

:area= (optional)

ITU international area. This parameter specifies the *area* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255** *, C

:id= (optional)

ITU international ID. This parameter specifies the *ID* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7** *, C

:msa= (optional)

24-bit ITU-national main signaling area value. This parameter specifies the *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255** *, C

:narea= (optional)

New ITU-international area value. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255** *, C

Default: No change to the current value

:nc= (optional)

Network cluster value. This parameter specifies one or more **nc** values for the network indicator and network cluster member values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255** *, C

:ncm= (optional)

Network cluster member value. This parameter specifies one or more **ncm** values for the network indicator and network cluster values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *, C

:ni= (optional)

Network indicator value. This parameter specifies one or more **ni** values for the network cluster and network cluster member values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *, C

:nid= (optional)

New ITU-international ID value. An asterisk (*) indicates the full range of values from **0–7**.

Range: 0-7, *, C

Default: No change to the current value

:nmsa= (optional)

New 24-bit ITU-national main signaling area value. This parameter specifies the new *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *, C

:nnc= (optional)

New network cluster. This parameter specifies one or more **nnc** values for the screening reference specified in the **sr** parameter. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *, C

Default: No change to the current value

:nncm= (optional)

New network cluster member. This parameter specifies one or more **nncm** values for the screening reference specified in the **sr** parameter. It specifies the new *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *, C

Default: No change to the current value

:nni= (optional)

New network identifier. This parameter specifies one or more **nni** values for the screening reference specified in the **sr** parameter. It specifies the new *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *, C

Default: No change to the current value

:nnp= (optional)

New ITU-national point code. An asterisk (*) indicates the full range of values from **0–16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you use multiple-part ITU national point codes, see

"Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: 0-16383 *, C
Default: No change to the current value

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from 0–16383.

Range: 0-16383 *, C

:npcst= (optional)

New point code subtype. This parameter indicates whether the specified new ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: cgpa, destfld, fail, isup, stop

cgpa—Allowed CGPA is the next screening category.

destfld—Allowed destination field (DESTFLD) is the next screening category.

fail—Discard the received message.

isup—ISUP message type (ISUP) is the next screening category.

stop—The gateway screening process ends and the message proceeds through normal routing.

Default: No change to the current value

:nsp= (optional)

New 24-bit ITU national signaling point. This parameter specifies the new *sp* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 0-255.

Range: 0-255 *, C

:nsr= (optional)

Next screening reference. This parameter specifies which screening reference in the specified screening category (**nsfi**) is to be used in the screening process.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: No change to the current value

:nssa= (optional)

New 24-bit ITU national sub signaling area. This parameter specifies the new *ssa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 0-255.

Range: 0-255 *, C

:nzone= (optional)

New ITU-international zone. This parameter specifies a new *zone* for the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from 0–7.

Range: 0-7 *, C

Default: No change to the current value

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:sp= (optional)

24-bit ITU national signaling point. This parameter specifies the *sp* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255** *, C

:ssa= (optional)

24-bit ITU national sub signaling area. This parameter specifies the *ssa* in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255** *, C

:zone= (optional)

ITU international zone. This parameter specifies the *zone* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7** *, C

Example

```
chg-scr-
blkdpc: sr=iec: ni=240: nc=010: ncm=010: nni=240: nnc=003: nncm=030
chg-scr-blkdpc: sr=iec: ni=c: nc=c: ncm=c: nsfi=cgpa: nsr=wrld2
chg-scr-blkdpc: sr=iec: ni=240: nc=010: ncm=010: nsfi=stop: actname=cr
chg-scr-blkdpc: sr=bdp1: npc=128: nsfi=fail: pcst=s: npcst=none
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

A complete point code must be specified, using the **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or **npc** combination unless a value of **c** for “continue” is specified.

A new point code entry must be specified by one, and only one of the four point code parameter combinations: **nni-nnc-nncm**, **nzone-narea-nid**, **nmsa-nssa-nsp**, or **nnpc**. If the new point code entry is a different point code type than the existing point code entry, all subfields of the new point code type must be specified.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

At least one optional parameter must be specified.

The blocked DPC specified by **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or the **npc** parameter must already exist in the screening reference or within an existing range of DPCs.

The new blocked DPC or DPC range defined by **ni-nc-ncm**; **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must not already exist in the screening reference or within an existing range of DPCs.

If an asterisk (*) is specified for the new blocked DPC, nothing that matches the specified range of DPCs can already exist in the DPC screening table for the screening reference.

If the **actname** parameter is specified, the **nsfi-stop** parameter must be specified.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACTNAME* field of the **rtrv-gws-actset** command output.

If the **area=*** parameter is specified, then the **id=*** parameter must be specified.

If the **msa=*** parameter is specified, then the **ssa=*** and the **sp=*** parameters must be specified.

If the **msa=c** parameter is specified, then the **ssa** and the **sp** parameters must have a value of **c** or must not be specified. If the **msa=c** parameter is specified, and the **ssa** and the **sp** parameters are not specified, then the **ssa** and **sp** parameters default to a value of **c**.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **ni=c** parameter is specified, then the **nc** and the **ncm** parameters must have a value of **c** or must not be specified. If the **ni=c** parameter is specified, and the **nc** and the **ncm** parameters are not specified, then the **nc** and **ncm** parameters default to a value of **c**.

If the specified **ni-nc-ncm**, **zone-area-id**, or **msa-ssa-sp** is not equal to **c-c-c**, or if the **npc=c** parameter is not specified, then the **nsfi=fail** parameter must be specified, and the **nsr** parameter cannot be specified.

If the **nnc** parameter is specified as a range, the **nncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nnc** parameter is specified as a single value or a range, a single value must be specified for the **nmi** parameter.

If the **nnc** parameter is specified as an asterisk (**nnc=***), the **nncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **nmi** and the **nnc** parameters must be specified with a single value.

If the **nmi** parameter is specified as an asterisk (**nmi=***) or as a range, the **nnc** and **nncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the value of the **nsfi** parameter is not **stop** or **fail**, then the **nsr** parameter must be specified.

If the **nsfi=fail** parameter is specified, then the **nmi**, **nc**, **nncm**, **narea**, **nzone**, **nid**, **nmsa**, **nssa**, **nsp**, and **npc** parameters cannot have a value of **c**.

The specified screening reference (**sr**) must already exist in the database.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The **pcst** and **npcst** parameters cannot be specified with **c** for a blocked screen reference (**sr**).

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** and **npcst** parameters cannot be specified for ANSI and ITU-N24 point codes.

If the **ssa=*** parameter is specified, then the **sp=*** parameter must be specified.

If the **zone=*** parameter is specified, then the **area=*** and the **id=*** parameters must be specified.

If the **zone=c** parameter is specified, then the **area** and the **id** parameters must have a value of **c** or must not be specified. If the **zone=c** parameter is specified, and the **area** and the **id** parameters are not specified, then the **area** and **id** parameters default to a value of **c**.

The **nsfi=fail** parameter cannot be specified when changing a continue entry.

The **nsfi** and **nsr** parameters cannot be specified when changing a screening entry that is other than the continue entry (**c-c-c**).

The value of the **nsfi** parameter must be valid for the BLKDPC entity type.

If the specified **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp** is equal to **c-c-c** or if the **npc=c** parameter is specified, the **nsfi=fail** parameter cannot be specified, and the **nni**, **nnc**, **nncm**, **nzone**, **narea**, **nid**, **nmsa**, **nssa**, **nsp**, and **nnpc** parameters cannot be specified. Point code **c-c-c** and **npc=c** cannot be changed to a numbered point code.

The **nsfi** and **nsr** parameters must point to an existing screen, or the **nsfi=stop** parameter must be specified, and the **nsr** parameter cannot be specified.

Notes

When a blocked DPC screening reference is created, the first entry for a point code must be **c-c-c**, or **c** for the **npc** parameter. Subsequent entries must be specific point codes.

The character **c** is used in the blocked DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked DPC screens. When screening for a blocked DPC and the point code being screened does not match any of the point codes in the blocked DPC screens, the message is not rejected and the screening process continues.

There must be an entry in the blocked DPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code is **npc=c** or subfields equal to **c-c-c**. When the character **c** is specified, the **nsfi** and **nsr** parameters must be specified.

If the character **c** is specified for the parameters **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp**, the character **c** is the only value that can be specified for all three parameters. No other values can be used. For example, a point code **c-c-255** is not allowed. The point code must be **c-c-c**. The asterisk (*) value cannot be used with the character **c** (for example, a point code **c-c-*** is not allowed).

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code **c-c-c** or **npc=c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

If the current **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp** is equal to **c-c-c** or **npc=c**, only the **nsfi** and **nsr** can be changed. Otherwise, only the blocked DPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

An asterisk cannot be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the **ent-scr-blkdpc** command.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** and **npcst** parameters indicate whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

chg-scr-blkopc**Change Blocked OPC**

Use this command to change the attributes associated with a screening reference in the blocked OPC category. Attributes that can be changed are the point code, next screening function identifier, and next screening reference.

Keyword: **chg-scr-blkopc**

Related Commands: **dlt-scr-blkopc**, **ent-scr-blkopc**, **rtrv-scr-blkopc**

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

Name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*, **none**

1 alphabetic character followed by up to 5 alphanumeric characters.

none—Remove an existing gateway screening stop action set from a gateway screening rule.

:area= (optional)

ITU international area. This parameter specifies the *area* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255** *, C

:id= (optional)

ITU international ID. The parameter specifies the *ID* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7** *, C

:msa= (optional)

24-bit ITU-national main signaling area value. This parameter specifies the *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255** *, C

:narea= (optional)

New ITU-international area value. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255** *, C

Default: No change to the current value

:nc= (optional)

Network cluster value. This parameter specifies one or more **nc** values for the network indicator and network cluster member values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the

point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *, C

:ncm= (optional)

Network cluster member value. This parameter specifies one or more **ncm** values for the network indicator and network cluster values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *, C

:ni= (optional)

Network indicator value. This parameter specifies one or more **ni** values for the network cluster and network cluster member values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *, C

:nid= (optional)

New ITU-international ID value. An asterisk (*) indicates the full range of values from **0–7**.

Range: 0-7, *, C

Default: No change to the current value

:nmsa= (optional)

New 24-bit ITU-national main signaling area value. This parameter specifies the new *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *, C

:nnc= (optional)

New network cluster. This parameter specifies one or more **nnc** values for the screening reference specified in the **sr** parameter. It specifies the new *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *, C

Default: No change to the current value

:nncm= (optional)

New network cluster member. This parameter specifies one or more **nncm** values for the screening reference specified in the **sr** parameter. It specifies the new *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *, C

Default: No change to the current value

:nni= (optional)

New network identifier. This parameter specifies one or more **nni** values for the screening reference specified in the **sr** parameter. It specifies the new *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *, C

Default: No change to the current value

:nnpc= (optional)

New ITU-national point code. An asterisk (*) indicates the full range of values from **0–16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you use multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: 0-16383 *, C
Default: No change to the current value

:npc= (optional)

ITU national point code. An asterisk (*) indicates the full range of values from 0-16383.

Range: 0-16383 *, C

:npcst= (optional)

New point code subtype. This parameter indicates whether the specified new ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: cgpa, fail, stop, sio, dpc, blkdpc

cgpa — Allowed CGPA

fail — Discard the received message.

stop — The gateway screening process ends and the message proceeds through normal routing.

sio — Allowed SIO

dpc — Allowed DPC

blkdpc — Blocked DPC

Default: No change to the current value

:nsp= (optional)

New 24-bit ITU national signaling point. This parameter specifies the new *sp* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 0-255.

Range: 0-255 *, C

:nsr= (optional)

Next screening reference. The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default: No change to the current value

:nssa= (optional)

New 24-bit ITU national sub signaling area. It specifies the new *ssa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 0-255.

Range: 0-255 *, C

:nzone= (optional)

New ITU-international zone. The parameter specifies a new zone for the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from 0-7.

Range: 0-7 *, C

Default: No change to the current value

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s
Default: none

:sp= (optional)

24-bit ITU national signaling point. This parameter specifies the *sp* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *, C

:ssa= (optional)

24-bit ITU national sub signaling area. This parameter specifies the *ssa* in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *, C

:zone= (optional)

ITU international zone. The parameter specifies the *zone* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: 0-7, *, C

Example

```
chg-scr-
blkopc: sr=iec: ni=240: nc=010: ncm=010: nni=240: nnc=010: nncm=020
chg-scr-blkopc: sr=iec: ni=c: nc=c: ncm=c: nsfi=dpc: nsr=wrld
chg-scr-blkopc: sr=iec: ni=c: nc=c: ncm=c: nsfi=stop: actname=none
chg-scr-blkopc: sr=bop1: npc=128: nsfi=fail: pcst=s: npcst=none
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gws=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

A complete point code must be specified, using the **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or **npc** combination unless a value of **c** for “continue” is specified.

A new point code entry must be specified by one, and only one of the four point code parameter combinations: **nni-nnc-nncm**, **nzone-narea-nid**, **nmsa-nssa-nsp**, or **nnpc**. If the new point code entry is a different point code type than the existing point code entry, all subfields of the new point code type must be specified.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

At least one optional parameter must be specified.

The blocked OPC specified by **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or the **npc** parameter must already exist in the screening reference or within an existing range of OPCs.

The new blocked OPC or OPC range defined by **ni-nc-ncm**; **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must not already exist in the screening reference or within an existing range of OPCs.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

The **actname** parameter value must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACTNAME* field of the **rtrv-gws-actset** command output.

If the **area=*** parameter is specified, then the **id=*** parameter must be specified.

If the **msa=*** parameter is specified, then the **ssa=*** and **sp=*** parameters must be specified.

If the **msa=c** parameter is specified, then the **ssa** and the **sp** parameters must have a value of **c** or must not be specified. If the **msa=c** parameter is specified, and the **ssa** and the **sp** parameters are not specified, then the **ssa** and **sp** parameters default to a value of **c**.

The **nsfi** and **nsr** parameters must point to an existing screen, or the **nsfi=stop** parameter must be specified, and the **nsr** parameter cannot be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc=*** parameter is specified, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **ni=c** parameter is specified, then the **nc** and the **ncm** parameters must have a value of **c** or must not be specified. If the **ni=c** parameter is specified, and the **nc** and the **ncm** parameters are not specified, then the **nc** and **ncm** parameters default to a value of **c**.

If the **nnc** parameter is specified as a range, the **nncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nnc** parameter is specified as a single value or a range, a single value must be specified for the **nni** parameter.

If the **nnc=*** parameter is specified, the **nnm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **nni** and the **nnc** parameters must be specified with a single value.

If the **nni** parameter is specified as an asterisk (**nni=***) or as a range, the **nnc** and **nncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **nsfi=fail** parameter is specified, then the **nni**, **nc**, **nncm**, **narea**, **nzone**, **nid**, **nmsa**, **nssa**, **nsp**, and **npc** parameters cannot have a value of **c**.

When changing a screening entry, and the **nsfi=fail** parameter is specified, the **nni**, **nnc**, **nncm**, **narea**, **nzone**, **nid**, **nmsa**, **nssa**, **nsp**, and **npc** parameters cannot have a value of **c**.

If the specified **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp** is equal to **c-c-c** or if the **npc=c** parameter is specified, the **nsfi=fail** parameter cannot be specified, and the **nni**, **nnc**, **nncm**, **nzone**, **narea**, **nid**, **nmsa**, **nssa**, **nsp**, and **npc** parameters cannot be specified. Point code **c-c-c** and **npc=c** cannot be changed to a numbered point code.

If the specified **ni-nc-ncm**, **zone-area-id**, or **msa-ssa-sp** is not equal to **c-c-c**, or the **npc=c** parameter is not specified, the **nsfi=fail** parameter must be specified, and the **nsr** parameter cannot be specified.

If the **ssa=*** parameter is specified, then the **sp=*** parameter must be specified.

The specified screening reference (**sr**) must already exist in the database.

The Spare Point Code Support feature must be enabled before the **pcst** and **npcst** parameters can be specified.

The **pcst** and **npcst** parameters cannot be specified with **c** for a blocked screen reference (**sr**).

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** and **npcst** parameters cannot be specified for ANSI and ITU-N24 point codes.

If the **zone=*** parameter is specified, then the **area=*** and **id=*** parameters must be specified.

If the **zone=c** parameter is specified, then the **area** and the **id** parameters must have a value of **c** or must not be specified. If the **zone=c** parameter is specified, and the **area** and the **id** parameters are not specified, then the **area** and **id** parameters default to a value of **c**.

If the **actname** parameter is specified, then the **nsfi=stop** parameter must be specified.

The value of the **nsfi** parameter must be valid for the BLKOPC entity type.

nsr can not be specified if a stop action is specified.

If the specified **ni-nc-ncm**, **zone-area-id**, or **msa-ssa-sp** equals **c-c-c**, then the **nsfi=fail** parameter cannot be specified.

If the specified **ni-nc-ncm**, **zone-area-id**, or **msa-ssa-sp** is not equal to **c-c-c**, or if the **npc=c** parameter is not specified, then the **nsfi=fail** parameter must be specified, and the **nsr** parameter cannot be specified.

The **nsfi** and **nsr** parameters cannot be specified when changing a screening entry that is other than **(c-c-c)**.

The the next screening reference (**nsr**) must be specified when the next screening function identifier (**nsfi**) is not equal to **stop** or **fail**.

Notes

When a blocked OPC screening reference is created, the first entry for a point code must be **c-c-c**, or **c** for the **npc** parameter. Subsequent entries must be specific point codes.

The character **c** is used in the blocked OPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked OPC screens. When screening for a blocked OPC and the point code being screened does not match any of the point codes in the blocked OPC screens, the message is not rejected and the screening process continues. There must be an entry in the blocked OPC screens to allow the screening process to continue.

This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code is **npc=c** or subfields equal to **c-c-c**. When the character **c** is specified, the **nsfi** and **nsr** parameters must be specified.

If the character **c** is specified for the parameters **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp**, the character **c** is the only value that can be specified for all three parameters. No other values can be used. For example, a point code **c-c-255** is not allowed. The point code must be **c-c-c**. The asterisk (*) value cannot be used with the character **c** (for example, a point code **c-c-*** is not allowed).

When the point code does not match any entries in the blocked OPC screens, the screening process is directed to the screening reference with the point code **c-c-c** or **npc=c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

If the current **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp** is equal to **c-c-c** or **npc=c**, only the **nsfi** and **nsr** can be changed. Otherwise, only the blocked OPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-blkopc** command.

If the screen set reaches 100% capacity (indicated by the "100% full" message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to the card. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** and **npcst** parameters indicate whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```

chg-scr-cdpa

Change Allowed Called Party Address

Use this command to change the attributes associated with a specific screening reference in the allowed called party address category. Attributes that can be changed are the point code, subsystem number, next screening function identifier, and next screening reference.

Keyword: **chg-scr-cdpa**

Related Commands: **dlt-scr-cdpa**, **ent-scr-cdpa**, **rtrv-scr-cdpa**

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:ssn= (mandatory)

Subsystem number. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:actname= (optional)

Action name. This parameter specifies the name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*, **none**

1 alphabetic character followed by up to 5 alphanumeric characters.

none—Remove an existing gateway screening stop action set from a gateway screening rule.

:area= (optional)

ITU international area. This parameter specifies the *area* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:id= (optional)

ITU international ID. This parameter specifies the *ID* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7 ***

:msa= (optional)

24-bit ITU-national main signaling area value. This parameter specifies the *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:narea= (optional)

New ITU-international area value. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

Default: No change to the current value

:nc= (optional)

Network cluster value. This parameter specifies one or more **nc** values for the network indicator and network cluster member values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

:ncm= (optional)

Network cluster member value. This parameter specifies one or more **ncm** values for the network indicator and network cluster values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

:ni= (optional)

Network indicator value. This parameter specifies one or more **ni** values for the network cluster and network cluster member values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

:nid= (optional)

New ITU-international ID value. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7 ***

Default: No change to the current value

:nmsa= (optional)

New 24-bit ITU-national main signaling area value. This parameter specifies the new *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

:nnc= (optional)

New network cluster. This parameter specifies one or more **nnc** values for the screening reference specified in the **sr** parameter. It specifies the new *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

Default: No change to the current value

:nncm= (optional)

New network cluster member. This parameter specifies one or more **ncm** values for the screening reference specified in the **sr** parameter. It specifies the new *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

Default: No change to the current value

:nni= (optional)

New network identifier. This parameter specifies one or more **nni** values for the screening reference specified in the **sr** parameter. It specifies the new *ni* of the point code represented by *ni-nc-ncm*. A

single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

Default: No change to the current value

:nnp= (optional)

New ITU-national point code. An asterisk (*) indicates the full range of values from **0–16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you use multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: **0-16383 ***

Default: No change to the current value

:npc= (optional)

ITU national point code. An asterisk (*) indicates the full range of values from **0–16383**.

Range: **0-16383 ***

:npst= (optional)

New point code subtype. This parameter indicates whether the specified new ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: **none, s**

Default: **none**

:nscmgfid= (optional)

New SCMG format ID. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **1–255**.

Range: **1-255 ***

Default: No change to the current value

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **aftpc, stop**

aftpc—Allowed affected point code is the next screening category.

stop—The gateway screening process ends and the message proceeds through normal routing.

Default: No change to the current value

:nsp= (optional)

New 24-bit ITU national signaling point. This parameter specifies the new *sp* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

:nsr= (optional)

Next screening reference. The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: No change to the current value

:nssa= (optional)

New 24-bit ITU national sub signaling area. This parameter specifies the new *ssa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

- :nssn=** (optional)
 New subsystem number. An asterisk (*) indicates the full range of values from **0–255**.
Range: **0-255 ***
Default: No change to the current value
- :nzone=** (optional)
 New ITU-international zone. This parameter specifies a new *zone* for the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.
Range: **0-7, *, C**
Default: No change to the current value
- :pcst=** (optional)
 Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).
Range: **none, s**
Default: **none**
- :scmgfid=** (optional)
 SCCP management format ID. This parameter consists of a one-octet field and uniquely defines the function and format of each SCMG message. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **1–255**. The following SCCP message types are screened against the Allowed CDPA table and all others are passed: UDT, UDTS, XUDT, XUDTS.
Range: **1-255 ***
- :sp=** (optional)
 24-bit ITU national signaling point. This parameter specifies the *sp* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0–255**.
Range: **0-255 ***
- :ssa=** (optional)
 24-bit ITU national sub signaling area. This parameter specifies the *ssa* in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0–255**.
Range: **0-255 ***
- :zone=** (optional)
 ITU international zone. This parameter specifies the *zone* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.
Range: **0-7, ***

Example

```
chg-scr-
cdpa: sr=cdp1: ni=5: nc=5: ncm=5: ssn=1: scmgfid=4: nsfi=stop: nni=6: nncm
=3 :nssn=*
chg-scr-
cdpa: sr=cdp1: ni=c: nc=c: ncm=c: ssn=1: scmgfid=3: nsfi=stop: actname=co
PY
chg-scr-
cgpa: sr=cgpa: zone=1: area=2: id=3: ssn=1: sccpmt=9: ri=*: nsfi=stop: pcs
t=s :npcst=none
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

A complete point code must be specified, and must be one and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**, except in the special case of entering **c** for "continue."

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

At least one optional parameter must be specified.

The CDPA point code, **scmgfid**, and **ssn** to be changed must already exist in the CDPA entity set.

The new CDPA point code, **scmgfid**, and **ssn** cannot already exist in the CDPA entity set.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

The **actname** parameter value must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACTNAME* field of the **rtrv-gws-actset** command output.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc=*** parameter is specified, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If the **nnc** parameter is specified as a range, the **nncm** parameter must be specified as an asterisk or as the full range **000-255**

If the **nnc** parameter is specified as a single value or a range, a single value must be specified for the **nmi** parameter.

If the **nnc=*** parameter is specified, the **nnm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **nmi** and the **nnc** parameters must be specified with a single value.

If the **nmi** parameter is specified as an asterisk (**nmi=***) or as a range, the **nnc** and **nncm** parameters must be specified as an asterisk or as the full range **000-255**.

If the **nsfi=aftpc** parameter is specified, the **ssn=1** parameter must be specified.

If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

If the **nsfi** parameter is specified with a value other than **stop**, the **nsr** parameter must be specified.

The next screening function identifier (**nsfi**) and the next screening reference (**nsr**) must point to an existing screen, or the **nsfi** must be equal to **stop** and the **nsr** must not be specified.

The specified screening reference (**sr**) must already exist in the database.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** and **npcst** parameters cannot be specified for ANSI and ITU-N24 point codes.

If the **ssn** parameter is specified with a value other than **1**, the **scmgfid** parameter cannot be specified.

If the **ssn=1** parameter is specified, the **scmgfid** parameter must be specified.

The specified value for the **nsfi** parameter is not valid for **cdpa** screen.

Notes

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

An asterisk can be specified for a parameter value in the **chg-scr-cdpa** and **dlt-scr-cdpa** commands *only* if that parameter value was specified as an asterisk in the **ent-scr-cdpa** command to define the parameter value.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
chg-scr-

chg-scr-cgpa

Change Allowed Calling Party Address

Use this command to change the attributes associated with a specific screening reference in the allowed calling party address category. Attributes that can be changed are the point code, subsystem number, routing indicator, next screening function identifier, and next screening reference.

Keyword: **chg-scr-cgpa**

Related Commands: **dlt-scr-cgpa**, **ent-scr-cgpa**, **rtrv-scr-cgpa**

Command Class: Database Administration

Parameters

:ri= (mandatory)

Routing indicator. This parameter specifies routing instructions to the receiving signaling point. In gateway screening, messages may be screened based on the value of the routing indicator.

Range: **dpc**, **gt**, *****

dpc—Allow a called party address with a routing indicator value of “DPC/SSN.”

gt—Screening stops and gateway screening is bypassed as a forced pass.

*****—Allow both routing indicator values.

- :sccpmt=** (mandatory)
 SCCP message type. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values.
Range: 9, 10, 17, 18, *
 9, * — UDT
 10, * — UDTS
 17, * — XUDT
 18, * — XUDTS
- :sr=** (mandatory)
 Screening reference. This parameter specifies the point code's unique screening reference name.
Range: *ayyy*
 1 alphabetic character followed by up to 3 alphanumeric characters
- :ssn=** (mandatory)
 Subsystem number. An asterisk (*) indicates the full range of values from 1-255.
Range: 1-255 *
- :actname=** (optional)
 Action name. This parameter specifies the name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).
Range: *ayyyyy*, none
 1 alphabetic character followed by up to 5 alphanumeric characters.
none—remove an existing gateway screening stop action set from a gateway screening rule.
- :area=** (optional)
 ITU international area. This parameter specifies the *area* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from 0-255.
Range: 0-255 *
- :id=** (optional)
 ITU international ID. This parameter specifies the *ID* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from 0-7.
Range: 0-7, *
- :msa=** (optional)
 24-bit ITU-national main signaling area value. This parameter specifies the *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 0-255.
Range: 0-255 *
- :narea=** (optional)
 New ITU-international area value. An asterisk (*) indicates the full range of values from 0-255.
Range: 0-255 *
Default: No change to the current value
- :nc=** (optional)
 Network cluster value. This parameter specifies one or more **nc** values for the network indicator and network cluster member values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 0-255.
Range: 0-255 *

:ncm= (optional)

Network cluster member value. This parameter specifies one or more **ncm** values for the network indicator and network cluster values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *

:ni= (optional)

Network indicator value. This parameter specifies one or more **ni** values for the network cluster and network cluster member values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *

:nid= (optional)

New ITU-international ID value. An asterisk (*) indicates the full range of values from **0–7**.

Range: 0-7, *

Default: No change to the current value

:nmsa= (optional)

New 24-bit ITU-national main signaling area value. This parameter specifies the new *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *

:nnc= (optional)

New network cluster. This parameter specifies one or more **nnc** values for the screening reference specified in the **sr** parameter. It specifies the new *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *

Default: No change to the current value

:nncm= (optional)

New network cluster member. This parameter specifies one or more **nncm** values for the screening reference specified in the **sr** parameter. It specifies the new *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *

Default: No change to the current value

:nni= (optional)

New network identifier. This parameter specifies one or more **nni** values for the screening reference specified in the **sr** parameter. It specifies the new *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *

Default: No change to the current value

:nnpc= (optional)

New ITU-national point code. An asterisk (*) indicates the full range of values from **0–16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you use multiple-part ITU national point codes, see

"Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: 0-16383 *
Default: No change to the current value

:npc= (optional)

ITU national point code. An asterisk (*) indicates the full range of values from 0-16383.

Range: 0-16383 *

:npcst= (optional)

New point code subtype. This parameter indicates whether the specified new ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:nri= (optional)

New routing indicator that provides routing instructions to the receiving signaling point. In gateway screening, messages may be screened based on the value of the routing indicator. An asterisk (*) indicates that both routing indicator values (**gt** and **dpc**) will be accepted in the gateway screening process.

Range: dpc, gt, *
dpc—Allow a called party address with a routing indicator value of "DPC/SSN."
gt—Screening stops and gateway screening is bypassed as a forced pass.

Default: No change to the current value

:nscpmt= (optional)

New SCCP message type. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values.

Range: 9, 10, 17, 18, *

Default: No change to the current value

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: cdpa, stop, tt
cdpa—Allowed called party address is the next screening category.
stop—The gateway screening process ends and the message proceeds through normal routing.
tt—Allowed translation type is the next screening category.

Default: No change to the current value

:nsp= (optional)

New 24-bit ITU national signaling point. This parameter specifies the new *sp* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 0-255.

Range: 0-255 *

:nsr= (optional)

Next screening reference. This parameter specifies which screening reference in the specified screening category (**nsfi**) is to be used in the screening process.

Range: ayyy
 1 alphabetic character followed by up to 3 alphanumeric characters

Default: No change to the current value

:nssa= (optional)

New 24-bit ITU national sub signaling area. This parameter specifies the new *ssa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *

:nssn= (optional)

New subsystem number. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *

Default: No change to the current value

:nzone= (optional)

New ITU-international zone. This parameter specifies a new *zone* for the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: 0-7, *, C

Default: No change to the current value

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:sp= (optional)

24-bit ITU national signaling point. This parameter specifies the *sp* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *

:ssa= (optional)

24-bit ITU national sub signaling area. This parameter specifies the *ssa* in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *

:zone= (optional)

ITU international zone. This parameter specifies the *zone* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: 0-7, *

Example

```
chg-scr-cgpa:sr=iec:ni=240:nc=010:ncm=010:ssn=3:ri=dpc
```

```
chg-scr-
```

```
cgpa:sr=iec:ni=240:nc=010:ncm=010:ssn=3:ri=dpc:nsfi=stop:actname=copy
```

```
chg-scr-
```

```
cgpa:sr=cdp1:ni=5:nc=5:ncm=5:ssn=1:ri=dpc:sccpmt=009:nsfi=sdpa:nsr=cdp1
```

```
chg-scr-
```

```
cgpa:sr=cgpa:zone=1:area=2:id=3:ssn=1:sccpmt=9:ri=*:nsfi=stop:pcst=s :npcst=none
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gws=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

A complete point code must be specified, and must be one, and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

At least one optional parameter must be specified.

The CGPA point code or range of point codes, **ri**, **sccpmt**, and subsystem number or numbers to be changed must exist in the CGPA entity set.

The new CGPA point code and subsystem number cannot already exist in the CGPA entity set.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACTNAME* field of the **rtrv-gws-actset** command output.

The next screening function identifier (**nsfi**) and the next screening reference (**nsr**) must point to an existing screen, or the **nsfi** must be equal to **stop** and the **nsr** must not be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If the **nnc** parameter is specified as a range, the **nncm** parameter must be specified as an asterisk or as the full range **000-255**

If the **nnc** parameter is specified as a single value or a range, a single value must be specified for the **nni** parameter.

If the **nnc** parameter is specified as an asterisk (**nnc=***), the **nncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **nni** and the **nnc** parameters must be specified with a single value.

If the **nni** parameter is specified as an asterisk (**nni=***) or as a range, the **nnc** and **nncm** parameters must be specified as an asterisk or as the full range **000-255**.

The **nsfi=cdpa** parameter can be specified only when the **ri=*** or the **ri=dpc** parameter is specified.

The **nsfi=tt** parameter can be specified only when the **ri=*** or the **ri=gt** parameter is specified.

If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

If the **nsfi** parameter has a value other than **stop**, the **nsr** parameter must be specified.

The specified screening reference (**sr**) must already exist in the database.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** and **npcst** parameters cannot be specified for ANSI and ITU-N24 point codes.

The **nsccpmt** and **sccpmt** parameter value must be specified in the range of {**9, 10, 17, 18**, and *****}.

The specified value for the **nsfi** parameter is not valid for **cgpa** screen.

The new CGPA point code, **ri**, **sccpmt**, and subsystem number (**ssn**) to be added can not already exist in the CGPA entity set.

Notes

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

An asterisk can be specified for a parameter value in the **chg-scr-cgpa** and **dlt-scr-cgpa** commands *only* if that parameter value was specified as an asterisk in the **ent-scr-cgpa** command to define the parameter value.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
chg-scr-cgpa:sr=iec:ni=240:nc=010:ncm=010:ssn=3:ri=dpc
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0

chg-scr-destfld

Change an Allowed DESTFLD

Use this command to change the attributes of a specific screening reference in the allowed affected destination field (DESTFLD) category. Attributes that can be changed are the allowed affected destination point codes.

Keyword: **chg-scr-destfld**

Related Commands: **dlt-scr-destfld**, **ent-scr-destfld**, **rtrv-scr-destfld**

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

Action name. This parameter specifies the name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *yyyyy*, **none**
 1 alphabetic character followed by up to 5 alphanumeric characters.
none—remove an existing gateway screening stop action set from a gateway screening rule.

:area= (optional)

ITU international area. This parameter specifies the *area* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255** *

:id= (optional)

ITU international ID. This parameter specifies the *ID* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7** *

:msa= (optional)

24-bit ITU-national main signaling area value. This parameter specifies the *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255** *

:narea= (optional)

New ITU-international area value. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255** *

Default: No change to the current value

:nc= (optional)

Network cluster value. This parameter specifies one or more **nc** values for the network indicator and network cluster member values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255** *

:ncm= (optional)

Network cluster member value. This parameter specifies one or more **ncm** values for the network indicator and network cluster values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255** *

:ni= (optional)

Network indicator value. This parameter specifies one or more **ni** values for the network cluster and network cluster member values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255** *

:nid= (optional)

New ITU-international ID value. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7** *

Default: No change to the current value

:nmsa= (optional)

New 24-bit ITU-national main signaling area value. This parameter specifies the new *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255** *

:nnc= (optional)

New network cluster. This parameter specifies one or more **nnc** values for the screening reference specified in the **sr** parameter. It specifies the new *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

Default: No change to the current value

:nncm= (optional)

New network cluster member. This parameter specifies one or more **ncm** values for the screening reference specified in the **sr** parameter. It specifies the new *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

Default: No change to the current value

:nni= (optional)

New network identifier. This parameter specifies one or more **nni** values for the screening reference specified in the **sr** parameter. It specifies the new *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

Default: No change to the current value

:nnpc= (optional)

New ITU-national point code. An asterisk (*) indicates the full range of values from **0–16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you use multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: **0-16383 ***

Default: No change to the current value

:npc= (optional)

ITU national point code. An asterisk (*) indicates the full range of values from **0–16383**.

Range: **0-16383 ***

:npct= (optional)

New point code subtype. This parameter indicates whether the specified new ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: **none, s**

Default: **none**

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process.

Range: **stop**

stop—The gateway screening process ends and the message proceeds through normal routing.

Default: No change to the current value

:nsp= (optional)

New 24-bit ITU national signaling point. This parameter specifies the new *sp* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

- :nsr=** (optional)
Next screening reference. This parameter specifies the point code's unique screening reference name.
Range: *ayyy*
1 alphabetic character followed by up to 3 alphanumeric characters
- :nssa=** (optional)
New 24-bit ITU national sub signaling area. This parameter specifies the new *ssa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.
Range: **0-255 ***
- :nzone=** (optional)
New ITU-international zone. This parameter specifies a new *zone* for the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.
Range: **0-7, *, C**
Default: No change to the current value
- :pcst=** (optional)
Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).
Range: **none, s**
Default: **none**
- :sp=** (optional)
24-bit ITU national signaling point. This parameter specifies the *sp* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.
Range: **0-255 ***
- :ssa=** (optional)
24-bit ITU national sub signaling area. This parameter specifies the *ssa* in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.
Range: **0-255 ***
- :zone=** (optional)
ITU international zone. This parameter specifies the *zone* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.
Range: **0-7, ***

Example

```
chg-scr-destfld:sr=iecn:ni=240:nc=010:ncm=019&&020:nncm=021
chg-scr-
destfld:sr=iecn:ni=240:nc=010:ncm=019&&020:nsfi=stop:actname=none
chg-scr-
destfld:sr=dst1:zone=1:area=2:id=3:nsfi=stop:pcst=s:npcst=none
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwasa=off** and **gwsa=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

A complete point code must be specified, using the **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or **npc** combination unless a value of **c** for “continue” is specified.

A new point code entry must be specified by one, and only one of the four point code parameter combinations: **nmi-nnc-nncm**, **nzone-narea-nid**, **nmsa-nssa-nsp**, or **nnpc**. If the new point code

entry is a different point code type than the existing point code entry, all subfields of the new point code type must be specified.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

At least one optional parameter must be specified.

The new DESTFLD defined by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must not already exist in the screening reference.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACTNAME* field of the **rtrv-gws-actset** command output.

If the **zone=*** parameter is specified, then the **area=*** and the **id=*** parameters must be specified.

If the **area=*** parameter is specified, then the **id=*** parameter must be specified.

If the **msa=*** parameter is specified, then the **ssa=*** and the **sp=*** parameters must be specified.

If the **ssa=*** parameter is specified, then the **sp=*** parameter must be specified.

If the **nsfi=stop** parameter is specified, then the **nsr** parameter cannot be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc=*** parameter is specified, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If the **nnc** parameter is specified as a range, the **nncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nnc** parameter is specified as a single value or a range, a single value must be specified for the **nni** parameter.

If the **nnc** parameter is specified as an asterisk (**nnc=***), the **nncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **nni** and the **nnc** parameters must be specified with a single value.

If the **nni** parameter is specified as an asterisk (**nni=***) or as a range, the **nnc** and **nncm** parameters must be specified as an asterisk or as the full range **000-255**.

The **nsfi=stop** parameter must be specified in the command

The entry specified by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must already exist in the screening reference.

The specified screening reference (**sr**) must already exist in the database.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** and **npcst** parameters cannot be specified for ANSI and ITU-N24 point codes.

If the **nsfi=fail** parameter is specified, then the **nni**, **nc**, **nncm**, **narea**, **nzone**, **nid**, **nmsa**, **nssa**, **nsp**, and **npc** parameters cannot have a value of **c**.

Notes

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

An asterisk can be specified for a parameter value in the **chg-scr-destfld** and **dlt-scr-destfld** commands *only* if that parameter value was specified as an asterisk in the **ent-scr-destfld** command to define the parameter value.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** and **npcst** parameters indicate whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
chg-scr-destfld:sr=iec:ni=240:nc=010:ncm=019&&020:nncm=021
```

```

```

chg-scr-dpc

Change Allowed DPC

Use this command to change the attributes of a specific screening reference in the allowed DPC category. Attributes that may be changed are the point code, next screening function identifier, and the next screening reference.

Keyword: **chg-scr-dpc**

Related Commands: **dlt-scr-dpc**, **ent-scr-dpc**, **rtrv-scr-dpc**

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

Action name. This parameter specifies the name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*, **none**

1 alphabetic character followed by up to 5 alphanumeric characters.

none—remove an existing gateway screening stop action set from a gateway screening rule.

:area= (optional)

ITU international area. This parameter specifies the *area* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

:id= (optional)

ITU international ID. The parameter specifies the *ID* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7, ***

:msa= (optional)

24-bit ITU-national main signaling area value. This parameter specifies the *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:narea= (optional)

New ITU-international area value. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

Default: No change to the current value

:nc= (optional)

Network cluster value. This parameter specifies one or more **nc** values for the network indicator and network cluster member values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

:ncm= (optional)

Network cluster member value. This parameter specifies one or more **ncm** values for the network indicator and network cluster values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

:ni= (optional)

Network indicator value. This parameter specifies one or more **ni** values for the network cluster and network cluster member values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

:nid= (optional)

New ITU-international ID value. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7, ***

Default: No change to the current value

:nmsa= (optional)

New 24-bit ITU-national main signaling area value. This parameter specifies the new *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:nnc= (optional)

New network cluster. This parameter specifies one or more **nnc** values for the screening reference specified in the **sr** parameter. It specifies the new *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

Default: No change to the current value

:nncm= (optional)

New network cluster member. This parameter specifies one or more **nncm** values for the screening reference specified in the **sr** parameter. It specifies the new *nncm* of the point code represented by *ni-nc-nncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

Default: No change to the current value

:nni= (optional)

New network identifier. This parameter specifies one or more **nni** values for the screening reference specified in the **sr** parameter. It specifies the new *nni* of the point code represented by *ni-nc-nncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

Default: No change to the current value

:nnp= (optional)

New ITU-national point code. An asterisk (*) indicates the full range of values from **0-16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you use multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: **0-16383 ***

Default: No change to the current value

:npc= (optional)

ITU national point code. An asterisk (*) indicates the full range of values from **0-16383**.

Range: **0-16383 ***

:npcst= (optional)

New point code subtype. This parameter indicates whether the specified new ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s-**).

Range: **none, s**

Default: **none**

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **blkdpc, cgpa, destfld, isup, stop**

blkdpc—Blocked DPC is the next screening category.

cgpa—Allowed CGPA is the next screening category.

destfld—Allowed destination field (DESTFLD) is the next screening category.

isup—ISUP message type (ISUP) is the next screening category.

stop—The gateway screening process ends and the message proceeds through normal routing.

Default: No change to the current value

:nsp= (optional)

New 24-bit ITU national signaling point. This parameter specifies the new *sp* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:nsr= (optional)

Next screening reference. This parameter specifies which screening reference in the specified screening category (**nsfi**) is to be used in the screening process.

Range: *ayyy*
1 alphabetic character followed by up to 3 alphanumeric characters

Default: No change to the current value

:nssa= (optional)

New 24-bit ITU national sub signaling area. This parameter specifies the new *ssa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:nzone= (optional)

New ITU-international zone. This parameter specifies a new *zone* for the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7, *, C**

Default: No change to the current value

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: **none, s**

Default: **none**

:sp= (optional)

24-bit ITU national signaling point. This parameter specifies the *sp* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:ssa= (optional)

24-bit ITU national sub signaling area. This parameter specifies the *ssa* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:zone= (optional)

The ITU international zone. The parameter specifies the *zone* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7, ***

Example

```
chg-scr-dpc:sr=iec:ni=240:nc=010:ncm=010:nni=240:nnc=003:nncm=030
```

```
chg-scr-
```

```
dpc:sr=iec:ni=240:nc=010:ncm=010:nni=240:nnc=003:nncm=030:nsfi=stop:actname=none
```

```
chg-scr-dpc:sr=dpc1:npc=128:nsfi=fail:pcst=s:npcst=none
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters *gwsa=off* and *gwsn=on*, the gateway screening action in the stop action set specified by the *actname* parameter of the screen set *will* be performed at the end of the screening process.

A complete point code must be specified, using the **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or **npc** combination unless a value of **c** for “continue” is specified.

A new point code entry must be specified by one, and only one of the four point code parameter combinations: **nni-nnc-nncm**, **nzone-narea-nid**, **nmsa-nssa-nsp**, or **nnpc**. If the new point code entry is a different point code type than the existing point code entry, all subfields of the new point code type must be specified.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed. At least one optional parameter must be specified.

The DPC specified by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must already exist in the screening reference or within an existing range of DPCs.

The new DPC or DPC range defined by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must not already exist in the screening reference or within an existing range of DPCs.

If the **actname** parameter is specified, then the **nsfi=stop** parameter must be specified.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

The **actname** parameter value must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

If the **zone=*** parameter is specified, then the **area=*** and the **id=*** parameters must be specified.

If the **area=*** parameter is specified, then the **id=*** parameter must be specified.

If the **msa=*** parameter is specified, then the **ssa=*** and the **sp=*** parameters must be specified.

If the **ssa=*** parameter is specified, then the **sp=*** parameter must be specified.

The **nsfi** and **nsr** parameters must point to an existing screen, or the **nsfi=stop** parameter must be specified, and the **nsr** parameter cannot be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc=*** parameter is specified, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If the **nnc** parameter is specified as a range, the **nncm** parameter must be specified as an asterisk or as the full range **000-255**

If the **nnc** parameter is specified as a single value or a range, a single value must be specified for the **nni** parameter.

If the **nnc=*** parameter is specified, the **nncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **nni** and the **nnc** parameters must be specified with a single value.

If the **nni** parameter is specified as an asterisk (**nni=***) or as a range, the **nnc** and **nncm** parameters must be specified as an asterisk or as the full range **000-255**.

If the **nsfi=stop** parameter is not specified, then the **nsr** parameter must be specified.

The value of the **sr** parameter must already exist in the BLKDPC entity set.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** and **npcst** parameters cannot be specified for ANSI and ITU-N24 point codes.

If the **nsfi=fail** parameter is specified, then the **nni**, **nc**, **nncm**, **narea**, **nzone**, **nid**, **nmsa**, **nssa**, **nsp**, and **npc** parameters cannot have a value of **c**.

Notes

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-dpc** command.

If the screen set reaches 100% capacity (indicated by the “100% full” message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to the card. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** and **npcst** parameters indicate whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
chg-scr-dpc: sr=iec: ni=240: nc=010: ncm=010: nni=240: nnc=003: nncm=030
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
CHG-SCR-DPC: SCREEN SET AFFECTED - IEC 25% FULL
CHG-SCR-DPC: MASP A - COMPLTD
;
```

chg-scr-isup**Change Allowed ISUP Screening Reference**

Use this command to change the attributes associated with a specific allowed ISUP screening reference in the Allowed ISUP entity set.

Keyword: **chg-scr-isup**

Related Commands: **dlt-scr-isup**, **ent-scr-isup**, **rtrv-scr-isup**

Command Class: Database Administration

Parameters

:isupmt/tupmt= (mandatory)

ISUP or TUP message type. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

Action name. This parameter specifies the stop action set name.

Range: *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

Default: No change to the current value

:nisupmt/ntupmt= (optional)

New ISUP or new TUP message type. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process.

Range: **stop**
stop—The gateway screening process ends and the message proceeds through normal routing.

Default: No change to the current value

:nsr= (optional)

Next screening reference. The parameter specifies which screening reference in the specified screening category (**nsfi**) is to be used in the screening process.

Range: *ayyy*
 1 alphabetic character followed by up to 3 alphanumeric characters

Default: No change to the current value

Example

```
chg-scr-isup: sr=iec: isupmt=1: nisupmt=1 &&2
```

```
chg-scr-isup: tupmt=20: ntupmt=1: sr=tu01
```

Dependencies

At least one optional parameter must be specified.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACTNAME* field of the **rtrv-gws-actset** command output.

The value specified for the **isupmt** or **tupmt** parameter must already exist in the screening reference specified by the **sr** parameter.

The specified **nisupmt** or **ntupmt** parameter value must not already exist in the specified **sr**.

If the **nsfi** parameter is specified, the parameter value must be **stop**.

If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

Notes

An asterisk can be specified for a parameter value in the **chg-scr-isup** and **dlt-scr-isup** commands *only* if that parameter value was specified as an asterisk in the **ent-scr-isup** command to define the parameter value.

A range of values can be specified for the **isupmt** parameter or **tupmt** parameter, by separating the values that define the range by two ampersands (**&&**); for example, **:isupmt=025&&100** specifies all ISUP message types from **25** to **100**. The value to the left of the **&&** must be less than the value to the right of the **&&** in the range.

TUP does not apply to SEAS. ISUP Message Type is the default.

To use TUP message type screening, an SIO screening reference with **si=04** (TUP) must exist in the SIO table. The TUP screening reference specifies the SIO screening reference as the next screening reference parameter (**nsr**) value.

To use ISUP message type screening, an SIO screening reference with **si=05** (ISUP) must exist in the SIO table. The ISUP screening reference specifies the ISUP SIO screening reference as the next screening reference parameter (**nsr**) value.

To screen for TUP and ISUP message types using a combined ISUP/TUP screen set, the SIO screening reference with **si=4** and the SIO screening reference with **si=5** must be two different screening references. The TUP screening reference specifies the SIO screening reference as the next screening reference parameter (**nsr**) value, and the ISUP screening reference specifies the SIO ISUP screening reference as the next screening reference parameter (**nsr**) value.

Output

When a screening reference is specified that is not yet associated with a screen set, the following output appears:

```
chg-scr-isup:sr=is01:isupmt=2:nsfi=stop:nisupmt=4
rlghncxa03w 04-01-14 16:45:50 EST EAGLE 31.3.0
CHG-SCR-ISUP: MASP A - COMPLTD
;
```

When a screening reference is specified that is already associated with one or more screen sets, the following output appears:

```
chg-scr-isup:sr=is02:isupmt=9:nsfi=stop:nisupmt=8
tekelecstp 04-02-17 16:35:56 EST EAGLE 31.4.0
Extended Processing Time Required -- Please Wait
Notice: The number of screensets affected is 2.
CHG-SCR-ISUP: SCREEN SET AFFECTED - ist1 1% FULL
CHG-SCR-ISUP: SCREEN SET AFFECTED - ist2 1% FULL
CHG-SCR-ISUP: MASP A - COMPLTD
;
```

chg-scr-opc**Change Allowed OPC**

Use this command to change the attributes associated with a specific screening reference in the allowed OPC category. Attributes that can be changed are the point code, next screening function identifier and, next screening reference.

Keyword: **chg-scr-opc**

Related Commands: **dlt-scr-opc, ent-scr-opc, rtrv-scr-opc**

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

Action name. This parameter specifies the name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy, none*

1 alphabetic character followed by up to 5 alphanumeric characters.

none—Remove an existing gateway screening stop action set from a gateway screening rule.

:area= (optional)

ITU international area. This parameter specifies the *area* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:id= (optional)

ITU international ID. This parameter specifies the *ID* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7, ***

:msa= (optional)

24-bit ITU-national main signaling area value. This parameter specifies the *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:narea= (optional)

New ITU-international area value. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

Default: No change to the current value

:nc= (optional)

Network cluster value. This parameter specifies one or more **nc** values for the network indicator and network cluster member values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:ncm= (optional)

Network cluster member value. This parameter specifies one or more **ncm** values for the network indicator and network cluster values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:ni= (optional)

Network indicator value. This parameter specifies one or more **ni** values for the network cluster and network cluster member values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:nid= (optional)

New ITU-international ID value. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7, ***

Default: No change to the current value

:nmsa= (optional)

New 24-bit ITU-national main signaling area value. This parameter specifies the new *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:nnc= (optional)

New network cluster. This parameter specifies one or more **nnc** values for the screening reference specified in the **sr** parameter. It specifies the new *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

Default: No change to the current value

:nncm= (optional)

New network cluster member. This parameter specifies one or more **nncm** values for the screening reference specified in the **sr** parameter. It specifies the new *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

Default: No change to the current value

:nni= (optional)

New network identifier. This parameter specifies one or more **nni** values for the screening reference specified in the **sr** parameter. It specifies the new *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

Default: No change to the current value

:nnp= (optional)

New ITU-national point code. An asterisk (*) indicates the full range of values from **0–16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you use multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: **0-16383 ***

Default: No change to the current value

:npc= (optional)

ITU national point code. An asterisk (*) indicates the full range of values from **0–16383**.

Range: **0-16383 ***

:npct= (optional)

New point code subtype. This parameter indicates whether the specified new ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: **none, s**

Default: **none**

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **blkdpc, blkopc, cgpa, dpc, sio, stop**

blkdpc—Blocked DPC is the next screening category.

blkopc—Blocked OPC is the next screening category.

cgpa—Allowed CGPA is the next screening category.

dpc—Allowed DPC is the next screening category.

sio—Allowed SIO is the next screening category.

stop—The gateway screening process ends and the message proceeds through normal routing.

Default: No change to the current value

:nsp= (optional)

New 24-bit ITU national signaling point. This parameter specifies the new *sp* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:nsr= (optional)

Next screening reference. This parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: No change to the current value

:nssa= (optional)

New 24-bit ITU national sub signaling area. This parameter specifies the new *ssa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:nzone= (optional)

New ITU-international zone. This parameter specifies a new *zone* for the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7, *, C**

Default: No change to the current value

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: **none, s**

Default: **none**

:sp= (optional)

24-bit ITU national signaling point. This parameter specifies the *sp* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:ssa= (optional)

24-bit ITU national sub signaling area. This parameter specifies the *ssa* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:zone= (optional)

ITU international zone. This parameter specifies the *zone* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7, ***

Example

```
chg-scr-opc:sr=iec:ni=240:nc=010:ncm=010:nni=240:nnc=010:nncm=020
```

```
chg-scr-
```

```
opc:sr=iec:ni=240:nc=010:ncm=010:nni=240:nnc=010:nncm=020:nsfi=st
```

```
op :actname=cncf
```

```
chg-scr-opc:sr=iec:nsfi=dpc:nsr=wr2
```

```
chg-scr-opc:sr=opc1:npc=128:nsfi=fail:pcst=s:npcst=none
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters *gwsa=off* and *gws=on*, the gateway screening action in the stop action set specified by the *actname* parameter of the screen set *will* be performed at the end of the screening process.

A complete point code must be specified, using the **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or **npc** combination unless a value of **c** for “continue” is specified.

A new point code entry must be specified by one, and only one of the four point code parameter combinations: **nni-nnc-nncm**, **nzone-narea-nid**, **nmsa-nssa-nsp**, or **nnpc**. If the new point code entry is a different point code type than the existing point code entry, all subfields of the new point code type must be specified.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

At least one optional parameter must be specified.

The current OPC specified by **ni-nc-ncm**; **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must already exist in the screening reference or within an existing range of OPCs.

The new OPC or OPC range defined by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must not already exist in the screening reference or within an existing range of OPCs.

If the **actname** parameter is specified, then the **nsfi=stop** parameter must be specified.

If the **nsr** parameter is specified, then the **actname** parameter cannot be specified.

The **actname** parameter value must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACTNAME* field of the **rtrv-gws-actset** command output.

If **zone=*** is specified, **area=*** and **id=*** must be specified.

If the **area=*** parameter is specified, the **id=*** parameter must be specified.

If the **msa=*** parameter is specified, the **ssa=*** and **sp=*** parameters must be specified.

If the **ssa=*** parameter is specified, the **sp=*** parameter must be specified.

The **nsfi** and **nsr** parameters must point to an existing screen, or the **nsfi=stop** parameter must be specified, and the **nsr** parameter cannot be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc=*** parameter is specified, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **nnc** parameter is specified as a range, the **nncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nnc** parameter is specified as a single value or a range, a single value must be specified for the **nni** parameter.

If the **nnc=*** parameter is specified, the **nncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **nni** and the **nnc** parameters must be specified with a single value.

If the **nni** parameter is specified as an asterisk (**nni=***) or as a range, the **nnc** and **nncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **nsfi=stop** parameter is not specified, then the **nsr** parameter must be specified.

The value of the **sr** parameter must already exist in the BLKOPC entity set.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

Notes

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-opc** command.

If the screen set reaches 100% capacity (indicated by the “100% full” message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to the card. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** and **npcst** parameters indicate whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
chg-scr-opc:sr=iec:ni=240:nc=010:ncm=010:nni=240:nnc=010:nncm=020
rlghncxa03w 04-01-07 12:05:33 EST EAGLE 31.3.0

```

chg-scr-sio**Change Allowed SIO**

Use this command to change a specific screening reference in the allowed service indicator octet category. Attributes that may be changed are the network indicator, service indicator, message priority, heading codes, next screening function identifier, and next screening reference.

NOTE: To use TUP message type screening, an SIO screening reference with si=04 (TUP) must be defined in the SIO table. This SIO screening reference is specified as the next screening reference (nsr) value in an ISUP screening reference for screening TUP message types.

Keyword: **chg-scr-sio**

Related Commands: **dlt-scr-sio, ent-scr-sio, rtrv-scr-sio**

Command Class: Database Administration

Parameters

:nic= (mandatory)

Network indicator code. This parameter specifies whether the message originated from an international (**0**) or national (**2**) network. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-3**.

Range: **0-3 ***

:pri= (mandatory)

Message priority. This parameter specifies the new message priority in the SIO. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-3**.

Range: **0-3 ***

Default: No change to the current value

:si= (mandatory)

Service indicator. This parameter specifies the type of message. The values are defined in Telcordia TR-NWT-000246.

Range: **00, 01- 15**

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

Action name. This parameter specifies the name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

none—remove an existing gateway screening stop action set from a gateway screening rule.

:h0= (optional)

This parameter is mandatory if the service indicator (**si**) value is **00**, **01**, **02**, or **03**. Otherwise, the **h0** parameter is undefined.

Range: **0-15 ***

Default: Current value or undefined

:h1= (optional)

This parameter is mandatory if the service indicator (**si**) value is **00**, **01**, **02**, or **03**. Otherwise, the **h1** parameter is undefined.

Range: **0-15 ***

Default: Current value or undefined

:nh0= (optional)

New H0 heading code. This parameter specifies a new H0 heading code for the screening reference specified in the **sr** parameter. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-15**.

Range: **0-15 ***

Default: No change to the current value

:nh1= (optional)

New H1 heading code. This parameter specifies a new H1 heading code for the screening reference specified in the **sr** parameter. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-15**.

Range: **0-15 ***

Default: No change to the current value

:nnic= (optional)

New network indicator code. This parameter specifies the new **nic** for the screening reference specified. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-3**.

Range: **0-3 ***

Default: No change to the current value

:npri= (optional)

New message priority. This parameter specifies the new message priority in the SIO. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-3**.

Range: **0-3 ***

Default: No change to the current value

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **blkdpc, cdpa, cgpa, destfld, isup, stop, dpc**
blkdpc— Blocked DPC
cdpa— Allowed CDPA
cgpa— Allowed CGPA
destfld— Allowed destination field (DESTFLD)
isup— ISUP message type (ISUP)
stop— The gateway screening process ends and the message proceeds through normal routing.
dpc— Allowed DPC

Default: No change to the current value

:nsi= (optional)

New service indicator. This parameter specifies the type of message for the specified screening reference. The values are defined in Telcordia TR-NWT-000246.

Range: **0- 15**

Default: No change to the current value

:nsr= (optional)

Next screening reference. This parameter specifies which screening reference in the specified screening category (**nsfi**) is to be used in the screening process.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: No change to the current value

Example

```
chg-scr-sio:sr=iec:nic=1:si=1:h0=02:h1=03:pri=*:nh0=03&&04
```

```
chg-scr-sio:sr=iec:nic=1:si=3:pri=2:npri=1
```

```
chg-scr-sio:sr=iec:nic=1:si=3:pri=3:nnic=2:nsfi=stop:actname=copy
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the **stop** action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

At least one attribute must be changed.

If asterisk values or ranges are specified for the new heading codes, nothing that matches the entire combination of **nic/nnic**, **si/nsi**, and the specified new heading codes and priorities can already exist in the allowed SIO category for the screening reference.

An asterisk cannot be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-sio** command.

If the **actname** parameter is specified, then the **nsfi=stop** parameter must be specified.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

The **actname** parameter value must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACTNAME* field of the **rtrv-gws-actset** command output.

The **nsfi** and **nsr** parameters must point to an existing screen, or the **nsfi=stop** parameter must be specified, and the **nsr** parameter cannot be specified.

The values specified for the **nsfi** and **si** parameters must meet the mapping requirements as shown:

- **nsfi=destfld—si=00**

- **nsfi=cdpa—si=03**
- **nsfi=cgpa—si=03**
- **nsfi=isup—si=05**

If the **si** parameter value is greater than **2**, and the **nsi** parameter value is greater than **3**, the **nh0** and **nh1** parameters are used to enter the required **h0** and **h1** parameter values.

Valid combinations for the **h0/h1** and **nh0/nh1** parameters are:

- **h0 (nh0)** is a single value—**h1 (nh1)** can be a single value, range, or an asterisk (*) entry
- **h0 (nh0)** is a range—**h1 (nh1)** can be an asterisk (*) entry
- **h0 (nh0)** is an asterisk (*) entry—**h1 (nh1)** can be an asterisk (*) entry

If the value specified for the **nsi** parameter is greater than **2**, then the **nh0** and **nh1** parameters cannot be specified.

Use Table 5-14 to determine additional acceptable combinations of specified parameter values

Table 5-14. Supported chg-scr-sio Parameter Combinations

si value:	nic value	pri value	h0 value:	h1 value:
0	s, *	s, *, r	s	s, *, r
0	s, *	s, *, r	*, r	*
1, 2	s, *	s, *, r	s	s, *, r
1, 2	s, *	s, *, r	*, r	*
3-15	s, *	s, *, r	u	u
<p>Legend</p> <p>s = single value</p> <p>r = range</p> <p>* = asterisk</p> <p>u = unspecified</p>				

If the **nh0** or **nh1** parameters are specified, the parameter values must be valid with the **h0** or **h1** values currently in the database.

The **h0**, **h1**, **nh0**, and **nh1** parameters cannot be specified if the **si** parameter is not equal to **00**, **01**, or **02**, and the **nsi** parameter is not specified.

The **nnic**, **nsi**, **pri**, and **nh0/nh1** parameters must not already exist in the allowed SIO category.

The **sr**, **nic**, **si**, **pri**, and **h0/h1** parameters for which attributes are to be changed must be in the allowed SIO category.

If **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

If the **nsfi=stop** parameter is not specified, then the **nsr** parameter must be specified.

If the **si** parameter is equal to **00**, **01**, or **02**, the **h0** and **h1** parameters must be specified. Otherwise, the **h0** parameter cannot be specified.

The specified screening reference (**sr**) must already exist in the database.

Notes

If the screen set reaches 100% capacity (indicated by the “100% full” message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to the card. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

To use TUP message type screening, an SIO screening reference with **si=04** (TUP) must be defined in the SIO table. To use ISUP message type screening, a rule with **si=05** (ISUP) must be defined in the SIO table. To use a combined ISUP/TUP screen set for TUP and ISUP message screening, the SIO screening reference with **si=4** and the SIO screening reference with **si=5** must be two different screening references.

A network indicator value of **1** or **3** can be used in private networks.

A network indicator value of **3** can be used in some national networks to broaden the identity of a national network, but is usually spare.

Output

```
chg-scr-sio:sr=iec:nic=1:si=3:pri=2:npri=1

chg-scr-tt

Change Allowed Translation Type

Use this command to change the attributes of a specific screening reference in the allowed translation type category. Attributes that can be changed are the translation type, next screening function identifier and next screening reference.

Keyword: **chg-scr-tt**

Related Commands: **dlt-scr-tt**, **ent-scr-tt**, **rtrv-scr-tt**

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:type= (mandatory)

Translation type. This parameter specifies the GTT type value in the CdPA. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255** *, && (Allow intervals)

:actname= (optional)

Action name. This parameter specifies the name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*, none

1 alphabetic character followed by up to 5 alphanumeric characters.

none—remove an existing gateway screening stop action set from a gateway screening rule.

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **cdpa, stop**

cdpa—Allowed called party address is the next screening category.

stop—The gateway screening process ends and the message proceeds through normal routing.

Default: No change to the current value

:nsr= (optional)

Next screening reference. This parameter specifies which screening reference in the specified screening category (**nsfi**) is to be used in the screening process.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: No change to the current value

:ntype= (optional)

New translation type. This parameter specifies the GTT type value in the CdPA. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

Default: No change to the current value

Example

```
chg-scr-tt:sr=iec:type=012:ntype=014
```

```
chg-scr-tt:sr=iec:type=012:ntype=014:nsfi=stop:actname=none
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gws=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

At least one attribute must be changed.

The new translation type cannot already exist.

If an asterisk is specified for the new allowed **type**, no other translation types can exist in the screening table.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

The **actname** parameter value must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACTNAME* field of the **rtrv-gws-actset** command output.

The next screening function identifier and the next screening to be added must point to one or more existing screening references.

If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

If the **nsfi** parameter has a value other than **stop**, the **nsr** parameter must be specified.

If the screening reference exists, the single value or range specified for the allowed **type** to be added to the TT screen for the allowed TT screening reference must not already exist in that TT screen.

The screening reference and translation type for which the attributes are to be changed must exist.

The current translation type must already exist.

The value specified for the **type** parameter must be within the allowed range.

Notes

If the screen set reaches 100% capacity (indicated by the “100% full” message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to the card. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

An asterisk can be specified for a parameter value in the **chg-scr-tt** and **dlt-scr-tt** commands *only* if that parameter value was specified as an asterisk in the **ent-scr-tt** command to define the parameter value.

Output

```
chg-scr-tt:sr=iec:type=012:ntype=014
```

```
rlghncxa03w 04-01-07 12:05:33 EST EAGLE 31.3.0

```

chg-scrset

Change Screen Set

Use this command to change the attributes of a screen set. A screen set is a group of screening references that can be assigned to a linkset. It is defined by a name and a pointer to the first screening reference of a screen set.

Keyword: **chg-scrset**

Related Commands: **dlt-scrset**, **ent-scrset**, **rtrv-scrset**

Command Class: Database Administration

Parameters

At least one of these parameters must be specified: **nscrn**, **nsfi**, **nsr**.

:scrn= (mandatory)

Screen set name. Each screening reference must have a unique name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

Action name. This parameter specifies the name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

none—remove an existing gateway screening stop action set from a gateway screening rule.

:destfld= (optional)

This parameter turns on and off the automatic allowed affected destination screening for network management messages against the routing table, self point codes, and capability point codes. When this parameter is **on**, the automatic screening is applied at the end of the provisioned screen set.

Range: **yes**, **no**

Default: Current value

:nscrn= (optional)

New screen set name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Current value

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **blkdpc**, **blkopc**, **dpc**, **opc**, **sio**, **stop**

blkdpc—Blocked DPC is the next screening category.

blkopc—Blocked OPC is the next screening category.

dpc—Allowed DPC is the next screening category.

opc—Allowed OPC is the next screening category.

sio—Allowed SIO is the next screening category.

stop—The gateway screening process ends and the message proceeds through normal routing.

Default: Current value

:nsr= (optional)

Next screening reference. The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Current value

Example

```
chg-scrset:scrn=ss01:nsfi=opc:nsr=iec
```

```
chg-scrset:scrn=ss02:nsfi=stop:nscrn=ss03
```

```
chg-scrset:scrn=ss02:nscrn=ss03:nsfi=stop:actname=copy
```

```
chg-scrset:scrn=ss02:nsfi=stop:nscrn=ss03:destfld=no
```

Dependencies

The value of the **nscrn** parameter cannot be assigned to another screen set.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

The **actname** parameter value must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

The **nsfi** and **nsr** parameters must point to one or more existing entities in another entity set, or the **nsfi=stop** parameter must be specified, and the **nsr** parameter cannot be specified.

If the **nsfi=stop** parameter is not specified, then the **nsr** parameter must be specified.

An existing screen set must be removed from all linksets before it can be changed.

If the **nscrn** parameter is specified, the **scrn** parameter value cannot be referenced by a linkset.

If the next screening function identifier (**nsfi**) and the next screening reference (**nsr**) does not point to an existing screen, the **nsfi** must be equal to **stop** and the **nsr** parameter must not be specified.

At least one optional parameter must be specified.

Notes

If the screen set reaches 100% capacity (indicated by the “100% full” message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to the card. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The system validates the command to verify that the specified screen set name is in use.

Output

```
chg-scrset:scrn=ss01:nsfi=opc:nsr=iec
rlghncxa03w 04-01-07 09:35:10 EST EAGLE 31.3.0
CHG-SCRSET: SCREEN SET AFFECTED - SS01 25% FULL
CHG-SCRSET: MASP A - COMPLTD
;
```

chg-seas-config**Changes CCMR Configuration**

Use this command to configure information for the CCS Message Router (CCS MR) in the EAGLE 5 ISS database.

NOTE: The CCS MR is a stand-alone, self-contained system that provides a centralized mechanism for routing CCS network operations traffic between STPs/SCPs and existing and new OSS.

Keyword: chg-seas-config

Related Commands: rtrv-seas-config

Command Class: System Maintenance

Parameters

:authmode= (optional)

Authentication mode. This parameter specifies the authentication mode for the EAGLE 5 ISS. Password-based authentication is the only authentication mode that is supported currently.

Range: password

:conn= (optional)

Connection. This parameter specifies the CCS MR where the SEAS terminal is connected.

Range: ipmr1, ipmr2

:hname= (optional)

Host name. This parameter specifies the name of the remote host machine.

Range: *XXXXXXXXXXXX*

1-15 alphanumeric characters

The **hname** parameter allows quotation marks (") to be entered as part of the value.

If the value of the **hname** parameter contains quotation marks, then a hyphen (-) can also be used.

:ipaddr= (optional)

IP address. This parameter specifies the IP address of the CCS MR.

Range: 4 numbers separated by dots, with each number in the range of **0-255**.

:login= (optional)

This parameter specifies the login name that is used to create an SSH connection between the CCS MR and the EAGLE 5 ISS.

Range: *XXXXXXXXXXXX*

1-15 alphanumeric characters.

:port= (optional)

This parameter specifies the port number of the CCS MR.

Range: 1024-5000

:seascli= (optional)

This parameter specifies the SEASCLI portion of the EAGLE 5 ISS node name that is sent in SR-5129 messages.

The **seascli** value is different from the EAGLE 5 ISS **cli** value that is configured with the **chg-sid** command.

The corresponding SEASCLI name must be configured on the CCS MR. Refer to Telecordia Configuration Specification "Telcordia Technologies System Documentation", *BD-SNAM-ADMIN-4 Issue 14, November 2006*.

Range: axxxxxxxxx

1 alphabetic character followed by up to 10 alphanumeric characters

Example

chg-seas-

config: seascli=eaglestp001: conn=ipmr1: ipaddr=198.168.25.10: port=1500

chg-seas-config: conn=ipmr2: port=3000

chg-seas-config: conn=ipmr2: ipaddr=10.203.63.23

Dependencies

The SEAS Over IP feature must be enabled before this command can be entered.

The SEAS terminal must be inhibited before the **seascli**, **ipaddr**, **port**, **login**, **hname**, or **authmode** parameters can be specified.

The **conn** parameter must be specified before the **port**, **ipaddr**, **login**, or **hname** parameters can be specified.

The value of the password requested by the **login** parameter must be from 1 - 15 alphanumeric characters in length.

The **port** and **ipaddr** parameters must have unique values for each CCS MR.

Output

chg-seas-

config: seascli=eaglestp001: conn=ipmr1: ipaddr=198.168.25.10: port=1500

```
tekelecstp 07-06-16 22:34:11 IST EAGLE 37.5.0
CHG-SEAS-CONFIG: MASP A - COMPLTD
```

;

chg-secu-dflt

Change System-Wide Security-Related Defaults

Use this command to change various system-wide, security-related defaults, such as:

- The default password aging interval
- The default user ID aging interval
- Whether to allow or prohibit multiple simultaneous logins with the same user ID
- Control of the password security algorithm
- Login warning message text

- Clear the warning message text displayed during login to the EAGLE 5 ISS
- Password expiring notification interval
- Password expired grace period

Keyword: chg-secu-dflt

Related Commands: ent-user, login, rtrv-secu-dflt

Command Class: Security Administration

Parameters

:alpha= (optional)

Minimum number of alphabetic characters (a–z) required in a new password.

Range: 0-12

Default: Current value

System

Default: 1

:clwrntx= (optional)

Clear warning text. This parameter deletes warning message text.

Range: no, yes, all

no — Does not delete any warning message text.

yes — Deletes warning message text for the line specified by the **wrnln** parameter.

all — Deletes warning message text for all lines.

Default: No change to current value.

:minintrvl= (optional)

Minimum number of days before a password can be changed again.

Range: 0-30

Default: No change to the current value

System

Default: 1

:minlen= (optional)

Minimum number of characters that must be in a user password.

Range: 1-12

Default: Current value

System

Default: 8

:multlog= (optional)

This parameter specifies whether multiple simultaneous logins can be performed with a user ID.

Range: yes, no

yes — A user ID can be logged in to more than one terminal at the same time.

no — A user ID can be logged in to only one terminal at a time.

Default: Current value

System

Default: no

:num= (optional)

Minimum number of numeric characters required in a new password.

Range: 0-12

Default: Current value

System

Default: 1

:page= (optional)

Default password aging interval for newly created user IDs. If the **page** parameter is specified in the **ent-user** command, the system uses that value; otherwise, the system uses the value specified here.

Range: 0-999

Default: Current value

System

Default: 90

:pchreuse= (optional)

Number of characters that cannot be reused from the existing password when setting a new password.

Range: 0-10

Default: No change to the current value

System

Default: 4

:pgrace= (optional)

Number of days after password expiration during which the user can login without changing their password.

Range: 0-7

Default: No change to the current value

System

Default: 3

:pnotify= (optional)

Number of days before password expiration that the user is notified about the expiration.

Range: 0-30

Default: No change to the current value

System

Default: 7

:preuse= (optional)

Number of passwords in the password history that must be unique.

Range: 0-12

Default: No change to the current value

:punc= (optional)

Minimum number of punctuation characters required in a new password. A punctuation character is any character that is not an alphabetic or numeric character, including spaces.

Range: 0-12

Default: Current value

System

Default: 1

:uout= (optional)

Number of successive days a user ID can go unused (no successful login) before the system denies login. If the **uout** parameter is specified in the **ent-user** command, the system uses that value; otherwise, the system uses the value specified here.

Range: 0-999

Default: Current value

System

Default: 90

:wrnl= (optional)

Warning message line number. This parameter specifies the line number within the warning message to receive the new text specified by the **wrntx** parameter.

Range: 1-20
Default: Current value

:wrntx= (optional)

New message text for the warning message. This parameter specifies the text that replaces the current text of the warning message line specified by the **wrnln** parameter.

Range:
 Any quoted alphanumeric string from 0-70 characters in length; for example, "abc123".
Default: Current value

Example

```
chg-secu-dflt:minlen=5
```

The following example input shows how to add a blank line to the display after a successful login and how to cause lines not to display as part of the message after a successful login.

```
chg-secu-
dflt:wrnln=1:wrntx="*****"
*****"

chg-secu-dflt:wrnln=1:clrwrntx=yes
chg-secu-dflt:wrnln=3:wrntx="* unauthorized access or use may lead
to *"
chg-secu-dflt:wrnln=4:wrntx="* prosecution. *"
chg-secu-dflt:wrnln=5:wrntx="* 05-07-01 notice!!! eagle will be
upgraded between `"
chg-secu-dflt:wrnln=6:wrntx="* the hours of 2am-3am on 05-07-01. *"
chg-secu-dflt:wrnln=7:wrntx="* *"
chg-secu-dflt:wrnln=8:wrntx="* today's happy message: go with
tekelec!! *"
chg-secu-
dflt:wrnln=9:wrntx="*****"
*****"

chg-secu-dflt:wrnln=10:wrntx=" " (set to 1 space to insert a blank
line)
chg-secu-dflt:wrnln=10:clrwrntx=yes
chg-secu-dflt:clrwrntx=all
chg-secu-dflt:clrwrntx=no:multilog=yes
```

Dependencies

At least one optional parameter must be specified.

The sum of the values specified for the **alpha**, **num**, and **punc** parameters must not be greater than 12.

The **wrnln** and **wrntx** parameters must be specified together in this command.

Notes

The warning message lines are displayed in the scroll area in order after a successful login; that is, line 1, line 2, and so on.

Any warning message line deleted with **clrwrntx=yes** parameter is not displayed in the scroll area during login.

The following message is the default message delivered with every system:

```
NOTICE: This is a private computer system.  
Unauthorized access or use may lead to prosecution.
```

Even though the minimum number of characters allowed in a password is specified using the **minlen** parameter, the password also must satisfy the minimum value requirements specified on the **alpha**, **num**, and **punc** parameters. The actual minimum password length is the greater of either the value specified on the **minlen** parameter or the total number of characters specified on the **alpha**, **num**, and **punc** parameters.

For example, if **chg-secu-dflt:minlen=5:alpha=2:num=2:punc=2** is entered, the minimum number of password characters specified on the **minlen** parameter is 5. But the total number of characters specified in the **alpha**, **num**, and **punc** parameters is 6 (**alpha+num+punc**). The effective minimum number of characters is actually 6 rather than the 5 specified on the **minlen** parameter.

If the **clwrntx=yes** parameter is specified, then at least one line number must be specified.

Output

The following commands create the warning message that is shown in the output after the commands. The notes that are not bold in parentheses after some commands explain the displayed output. The warning message is displayed after the user enters the **login** command and a password. The output example shows the command output, a **login** command and password prompt, and the warning message that was created with these commands. See the Notes section for this command for additional information about entering this command.

```

chg-secu-dflt:wrnl=1:wrntx="*****"
chg-secu-dflt:wrnl=2:wrntx="* NOTICE: This is a private computer system. *"
chg-secu-dflt:wrnl=3:wrntx="* Unauthorized Access or use may lead to *"
chg-secu-dflt:wrnl=4:wrntx="* prosecution. *"

chg-secu-trm

Change Terminal Access Rights

Use this command to configure the access rights for a terminal. Only a user with system security administration authority can change a terminal's access rights. Access rights determine whether a terminal or port has command access to the system for the different command classes.

Keyword: chg-secu-trm

Related Commands: rtrv-secu-trm

Command Class: Security Administration

Parameters

:trm= (mandatory)

Terminal ID. This parameter specifies the port to be configured.

Range: 1-16

:all= (optional)

All non-configurable command classes. This parameter specifies whether to configure all of the command classes.

Range: yes, no

Default: No change to the current value

System

Default: no

:cc1= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) specifying whether the command class is allowed for the specified terminal. The parameter value format is *ayy -yes* or *ayy -no*.

Range: *ayy*

1 alphabetic character followed by 2 alphanumeric characters.

A dash and the indicator value follow the command class name:

-no—This command is not allowed for the specified terminal.

-yes—This command is allowed for the specified terminal.

:cc2= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) specifying whether the command class is allowed for the specified terminal. The parameter value format is *ayy -yes* or *ayy -no*.

Range: *ayy*

1 alphabetic character followed by 2 alphanumeric characters.

A dash and the indicator value follow the command class name:

-no—This command is not allowed for the specified terminal.

-yes—This command is allowed for the specified terminal.

:cc3= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) specifying whether the command class is allowed for the specified terminal. The parameter value is specified in the format *ayy -yes* or *ayy -no*.

Range: *ayy*

1 alphabetic character followed by 2 alphanumeric characters.

A dash and the indicator value follow the command class name:

-no—This command is not allowed for the specified terminal.

-yes—This command is allowed for the specified terminal.

:cc4= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) specifying whether the command class is allowed for the specified terminal. The parameter value format is *ayy -yes* or *ayy -no*.

Range: *ayy*

1 alphabetic character followed by 2 alphanumeric characters.

A dash and the indicator value follow the command class name:

-no—This command is not allowed for the specified terminal.

-yes—This command is allowed for the specified terminal.

:cc5= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the command class is allowed for the specified terminal. The parameter value format is *ayy -yes* or *ayy -no*.

Range: *ayy*

1 alphabetic character followed by 2 alphanumeric characters.

A dash and the indicator value follow the command class name:

-no—This command is not allowed for the specified terminal.

-yes—This command is allowed for the specified terminal.

:cc6= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) specifying whether the command class is allowed for the specified terminal. The parameter value format is *ayy -yes* or *ayy -no*.

Range: *ayy*

1 alphabetic character followed by 2 alphanumeric characters.

A dash and the indicator value follow the command class name:

-no—This command is not allowed for the specified terminal.

-yes—This command is allowed for the specified terminal.

:cc7= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the command class is allowed for the specified terminal. The parameter value format is *ayy -yes* or *ayy -no*.

Range: *ayy*

1 alphabetic character followed by 2 alphanumeric characters.

A dash and the indicator value follow the command class name:

-no—This command is not allowed for the specified terminal.

-yes—This command is allowed for the specified terminal.

:cc8= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) specifying whether the command class is allowed for the specified terminal. The parameter value format is *ayy -yes* or *ayy -no*.

Range: *ayy*

1 alphabetic character followed by 2 alphanumeric characters.

A dash and the indicator value follow the command class name:

-no—This command is not allowed for the specified terminal.

-yes—This command is allowed for the specified terminal.

:db= (optional)

Database Administration class. This parameter specifies whether the Database Administration class of commands is allowed.

Range: **yes, no**

Default: No change to the current value

System

Default: **no**

:dbg= (optional)

Debug class. This parameter specifies whether the Debug class of commands is allowed.

Range: **yes, no**

Default: No change to the current value
System
Default: **no**

:link= (optional)

Link Maintenance class. This parameter specifies whether the Link Maintenance class of commands is allowed.

Range: **yes, no**
Default: No change to the current value
System
Default: **no**

:pu= (optional)

Program Update class. This parameter specifies whether the Program Update class of commands is allowed.

Range: **yes, no**
Default: No change to the current value
System
Default: **no**

:sa= (optional)

Security Administration class. This parameter specifies whether the Security Administration class of commands is allowed.

Range: **yes, no**
Default: No change to the current value
System
Default: **no**

:sys= (optional)

System Maintenance class. This parameter specifies whether the System Maintenance class of commands is allowed.

Range: **yes, no**
Default: No change to the current value
System
Default: **no**

Example

```
chg-secu-trm: trm=3: all=yes
chg-secu-trm: trm=3: sys=yes: cc1=u04-no: cc3=u11-yes
```

Dependencies

This command is not supported on telnet terminals (terminal IDs 17-40).

At least one optional parameter must be specified.

Access rights for a terminal cannot be changed while a user is logged on to that terminal.

At least two terminal ports must be configured to have security administration authority.

The Command Class Management feature must be enabled before configurable command class name parameters (**cc1, cc2, cc3, cc4, cc5, cc6, cc7, cc8**) can be specified.

The value specified for a configurable command class name must be a default or provisioned command class name in the CCNAMES table.

If the **all** parameter is specified and any of the individual command classes are also specified, the individual command classes take precedence.

Notes

Up to 8 configurable command class name parameters can be entered in one command. Additional commands can be entered to change access rights for more than 8 names. To change access rights for all 32 available configurable command class names, four commands could be entered with 8 names specified in each command.

Security Administration ports whose terminal port type has been configured with a value of **none**, or **printer** do not allow commands to be entered. Because commands cannot be entered from terminals attached to these ports, they are not considered as ports configured for security administration authority.

Output

```

chg-secu-trm: trm=3: all=yes
rlghncxa03w 04-01-15 12:30:04 EST EAGLE 31.3.0
Command entered at terminal #13.

rlghncxa03w 04-01-15 12:30:07 EST EAGLE 31.3.0
CHG-SECU-TRM: MASP A - COMPLTD
;

```

chg-sg-opts**Change IP**

Use this command to change the IP⁷ Secure Gateway protocol options.

Keyword: **chg-sg-opts**

Related Commands: **rtrv-sg-opts**

Command Class: Database Administration

Parameters

:getcomm= (optional)

This parameter specifies the community name to use for SNMP Get and GetNext request validations. This value applies for each SSED CM, E5-ENET, and E5-ENET-B SNMP agent in the system.

Range: *////////////////////////////////////*

Any string up to 32 characters in length

If the string contains characters other than alphanumeric characters, the entire string must be enclosed in single quotes (' ').

The string can be entered in upper and lower case; the system converts upper case alphabetic characters to lower case.

Default: No change to the current value

System

Default: **public**

:ipgwabate= (optional)

Enable or disable IPGWx SS7 congestion abatement procedures. This parameter specifies whether the TFC is forwarded to the system's true point code, to allow MSUs to be discarded as part of abatement procedures on all cards running the IPGWx application. When set to **yes**, the system will maintain and abate congestion on behalf of IPGWx-connected nodes.

Range: **yes, no**

Default: No change to the current value

System

Default: **no**

:sctpcsum= (optional)

SCTP checksum algorithm for the node.

Range: **adler32, crc32c, percard**

percard—The system-wide SCTP checksum algorithm type is turned off, and the SCTP checksum algorithm can be configured on a per-card basis.

Default: No change to the current value

System

Default: **percard**

:setcomm= (optional)

This parameter specifies the community name to use for SNMP set request validations. This value applies for each SSEDCCM, E5-ENET, and E5-ENET-B SNMP agent in the system.

Range: **////////////////////////////////////**

Any string up to 32 characters in length.

If the string contains characters other than alphanumeric characters, the entire string must be enclosed in single quotes (' ').

The string can be entered in upper and lower case; the system converts upper case alphabetic characters to lower case.

Default: No change to the current value

System

Default: **private**

:snmpcont= (optional)

System contact information for each DCM SNMP agent in the Secure Gateway. This parameter specifies the sysContact object in the SNMP MIB II System Group (OID 1.3.6.1.2.1.1.4).

Range: **////////////////////////////////////**

Any string of up to 64 characters.

If the string contains characters other than alphanumeric characters, the entire string must be enclosed in single quotes (' ' -TO).

The string can be entered in upper and lower case; the system converts upper case alphabetic characters to lower case.

Default: No change to the current value

System

Default: **tekelec**

:srkq= (optional)

Static routing key quantity. The maximum number of routing key entries available in the Static Routing Key table of each SS7IPGW or IPGWI card.

Range: **0-2500**

Default: No change to the current value

System

Default: **1000**

:trapcomm= (optional)

This parameter specifies the value used in the community name field when SNMP traps are generated. This value applies for each SSEDCCM, E5-ENET, and E5-ENET-B SNMP agent in the system.

Range: **////////////////////////////////////**

Any string up to 32 characters in length.

If the string contains characters other than alphanumeric characters, the entire string must be enclosed in single quotes (' ').

The string can be entered in upper and lower case; the system converts upper case alphabetic characters to lower case.

Default: No change to the current value

System

Default: **public**

:uameasusedftas= (optional)

This parameter specifies whether UA measurements are pegged against the default application server or against the application server indicated by the routing context.

This parameter applies to SS7IPGW, E5-ENET, and E5-ENET-B cards. UA measurements for E5-ENET and E5-ENET-B cards running the IPGW application are always pegged against the default application server.

Range: **yes, no**

yes— UA measurement registers are pegged against the default application server.

no— UA measurement registers are pegged against the application server indicated by the routing context.

Default: No change to the current value

Example

```
chg-sg-opts: srkq=500
chg-sg-opts: snmpcont="John Doe 555-123-4444"
chg-sg-opts: getcomm=public
chg-sg-opts: setcomm=private
chg-sg-opts: sctpcsum=adler32
chg-sg-opts: trapcomm=public
chg-sg-opts: ipgwabate=yes
chg-sg-opts: uameasuseas=yes
```

Dependencies

At least one optional parameter must be specified.

The number of static entries in the Routing Key table cannot exceed the value specified for the **srkq** parameter.

The **srkq** parameter value must be greater than or equal to the current number of static routing key entries. Attempts to decrease the **srkq** value below the actual current number of static routing key entries are not allowed.

The total number of the **srkq** value cannot exceed 2500 for SSEDCEM, E5-ENET, or E5-ENET-B cards running the SS7IPGW or IPGWI application.

The total number of actual routing keys cannot not exceed 2500 per system.

Notes

The following conditions must be satisfied when changing routing key quantity assignments.

1. Total number if **srkq** cannot exceed 2500. The total number of routing keys per card on any SS7IPGW card (as reported by the **rept-stat-rtkey** command) cannot exceed 2500.
2. If **s** is the current maximum number of actual static routing keys, then **srkq** must be $\geq s$. Attempts to decrease **srkq** below **s** are not allowed.

The SCTP checksum algorithm affects the IPLIMx, IPGWx, and IPGW cards under the following conditions:

- All associations on the card are in the **open=no** state.
- No associations are provisioned on the card

If neither condition is true, the card raises minor alarm (UAM 298) under the following scenarios:

- The system-wide SCTP checksum algorithm is configured to a different value than the active SCTP checksum algorithm on the card.
- The system-wide SCTP checksum algorithm is set to **percard**, and the per-card setting is different than the active SCTP checksum algorithm on the card.

The alarm is cleared (UAM 299), and the SCTP checksum algorithm takes effect when all associations on the card are set to **open=no** or when the card is reset.

Output

```
chg-sg-opts : sctpcsum=percard
tekelecstp 08-02-22 17:56:31 EST EAGLE 38.0.0
CHG-SG-OPTS: MASP A - COMPLTD
;
```

chg-sid

Change Self Identification

Use this command to change the self-identification of the system. The self-identification identifies the system to the other signaling points in the network.

CAUTION: Use this command only during periods of low traffic. If you use the **chg-sid** command to change the point code, then the change does not become enabled until you initialize (**init-sys**) the system.

NOTE: If you use the **chg-sid** command to change the capability point code, then you do not need to initialize the system for the change to become enabled.

CAUTION: Changing a SID impacts all adjacent nodes that reference the SID. Both sides must be changed at the same time, or the signaling link test messaging will fail, and the links will go down.

Keyword: **chg-sid**

Related Commands: **ent-sid**, **rtrv-sid**

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

CAUTION: If there are STC cards in the system for the EAGLE 5 Integrated Monitoring Support (E5IS) feature, you must turn off the EIS copy function (see the **chg-eisopts** command) before you change the system CLLI. When the CLLI change is complete, use the **chg-eisopts** command to turn on the EIS copy function again.

:cli= (optional)

Common language location identifier. This parameter, which must be unique, identifies the system in terms of its physical location:

- The first four characters identify the city, town, or locality.

- The fifth and sixth characters identify state or province.
- The seventh and eighth characters identify the building.
- The last three characters identify the traffic unit.

Range: *ayyyyyyyyyy*
 1 alphabetic character followed by up to 10 alphanumeric characters
 The value **none** is invalid for the CLLI.

Default: No change to the current value

:cpc= (optional)

ANSI capability point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **cpc**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.

The point code **000-000-000** is not a valid point code.

:cpc/cpca/cpci/cpcn/cpcn24= (optional)

Capability point code. The code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network to which the STP belongs.

:cpci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:cpcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:cpcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:cpctype= (optional)

Capability point code type. This parameter specifies whether the capability point code is for the STP or for a particular service.

This parameter cannot be changed after it is assigned.

Range: **lnp, stp, inp, eir, gport, gflex, mnp, atinpq, vflex, aiq**

lnp— Local Number Portability

stp— EAGLE 5 ISS

inp— INAP-based Number Portability

eir— Equipment Identity Register

gport— G-Port (GSM Mobile Number Portability)

gflex— G-Flex (GSM Flexible Numbering)

mnp— Mobile Number Portability

atinpq— ATI Number Portability Query

vflex— Voice Mail Router

aiq— ANSI41 AnalyzedInformation Query

Default: **stp**

:npc= (optional)

New ANSI capability point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **npca**

Range: **000-255, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

Enter **none** to delete the point code.

The point code **000-000-000** is not a valid point code.

:npc/npc/npc/npc/npcn24= (optional)

New capability point code. Use new CPCs to replace or delete existing CPCs.

:npci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—0-7

area—000-255

id—0-7

Enter **none** to delete the point code.

The point code **0-000-0** is not a valid point code.

:npcn= (optional)

New ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

Enter **none** to delete the point code.

Default: No change to existing point code value.

:npcn24= (optional)

New 24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

Enter **none** to delete the point code.

:npci= (optional)

New STP ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

Enter **none** to delete the point code.

The point code **0-000-0** is not a valid point code.

none—deletes the existing spare ITU-I self ID point code

:npci/npcn= (optional)

New STP ITU national or international point code.

:npcn= (optional)

New STP ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz, none

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

Enter **none** to delete the point code.

none—deletes the existing spare ITU-N self ID point code

:pc= (optional)

ANSI STP point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **pca**

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

:pc/pca/pci/pcn/pcn24= (optional)

STP point code.

:pci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—s-
n—0-16383
gc—aa-zz
m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:pctype= (optional)

Point code type. This parameter does not affect ITU destinations.

Range: **ansi, other**

ansi—Supports point codes that meet the ANSI standard

other—Supports point codes that do not meet the ANSI standard.

Default: The point code type is not changed.

Example

To change the site identification PCTYPE to ANSI:

```
chg-sid:pctype=ANSI
```

To change the site identification CLLI to rlghncxa03w:

```
chg-sid:clli=rlghncxa03w
```

To add a new ANSI capability point code:

```
chg-sid:cpc=002-002-002
```

To delete an ITU-I capability point code:

```
chg-sid:cpci=2-003-4:ncpci=none
```

To change an existing ITU-N capability point code, 01234, to 02092: (The existing CPC is replaced with the new CPC.)

```
chg-sid:cpcn=01234:ncpcn=02092
```

To add a new ANSI LNP CPC:

```
chg-sid:cpc=002-002-002:cpctype=lnp
```

To change an existing ITU-N capability point code with a group code of 01234-aa to 02092-si: (The existing CPC is replaced with the new CPC.)

```
chg-sid:cpcn=01234-aa:ncpcn=02092-si:cpctype=stp
```

To change the ITU-N 24-bit site identification STP Point Code when no previous ITU-N site identification STP point code exists:

```
chg-sid:pcn24=1-101-1
```

To change the ITU-N site identification STP Point Code when a previous ITU-N site identification STP point code exists:

chg-sid:pcn=11111:npcn=none

To add a new ITU-N 24-bit Capability Point Code:

chg-sid:cpcn24=22-22-22

To change an existing 24-bit ITN-N Capability Point Code 22-22-22 to 33-33-33.

chg-sid:cpcn24=22-22-22:ncpcn24=33-33-33

To add a new EIR-type Capability Point Code:

chg-sid:cpctype=eir:cpci=2-30-1

To delete an existing ITUI Capability Spare Point Code:

chg-sid:cpci=s-2-003-4:ncpci=none

To change an existing node ITU-I spare true point code from an assigned point code value to none:

chg-sid:pci=s-1-234-5:npci=none

To change an existing ITU-N spare capability point code from s-01234 to s-02092. The existing CPC is replaced with the new CPC:

chg-sid:cpcn=s-01234:ncpcn=s-02092:cpctype=stp

chg-sid:pca=111-111-111:pci=1-234-5:pcn24=233-255-255

To change or add new node true point codes simultaneously, for ITU-I spare and ITU-N spare point code types.

chg-sid:pci=s-1-234-5:pcn=s-12345

To change an existing node ITU-N spare true point code from an assigned point code value to none:

chg-sid:pcn=s-12345:npcn=none

To change the CPC list to include an ANSI CPC for the G-Port service:

chg-sid:cpc=1-2-3:cpctype=gport

To change the CPC list to include an ITU-I CPC for the G-Flex service:

chg-sid:cpci=2-3-4:cpctype=gflex

To change the ITU-N site identification STP Point Code when a previous ITU-N site identification STP point code does not exist:

chg-sid:pcn=11112

To change the CPC list to include an ANSI CPC for the ATINPQ service:

chg-sid:cpc=3-4-6:cpctype=atinpq

To change the CPC list to include an ANSI CPC for the AIQ service:

chg-sid:cpc=2-3-5:cpctype=aiq

Dependencies

At least one optional parameter must be specified.

The Spare Point Code Support feature must be enabled before a spare point code (prefix **s-**) can be specified in the command.

The value specified for the **pcn**, **cpcn**, or **npcn** parameter must be a full point code.

The STP destination and capability point codes can be specified only as full point codes or **none**.

If the **ncpc**, **ncpca**, **ncpci**, **ncpcn**, or **ncpcn24** parameter is specified, a corresponding existing **cpc**, **cpc**, **cpci**, **cpcn**, or **cpcn24** parameter must be specified.

If the **npci** parameter or the **npcn** parameter is specified, a corresponding existing **pci** parameter value or **pcn** parameter value must be specified.

If the **cpctype** parameter is specified, the **cpc**, **cpca**, **cpci**, **cpcn**, or **cpcn24** parameter must be specified.

If the **cpctype** parameter is specified, an **npcpc**, **npcpca**, **npcpci**, **npcpcn**, or **npcpcn24** parameter cannot be specified in the command.

The values of the **pc/pca/pci/pcn/pcn24**, **cpc/cpca/cpci/cpcn/cpcn24**, and **npc/npca/npci/npcn/npcn24** parameters cannot be equal.

The STP capability point code type (domain) must match the new STP capability point code type (domain).

If the **cpctype=lnp** parameter is specified, then the **cpc/cpca** parameter must be specified with an ANSI point code value.

If the **cpctype=inp** parameter or the **cpctype=eir** parameter is specified, the **cpc** parameter and the **cpca** parameter cannot be specified for the point code. An ANSI point code cannot be specified.

The LNP feature must be turned on before the **cpctype=lnp** parameter can be specified.

The INP feature must be on before the **cpctype=inp** parameter can be specified.

The EIR feature must be on before the **cpctype=eir** parameter can be specified.

Only the **pcn** parameter or the **pcn24** parameter can be specified; however, both parameters cannot be specified in the same command.

If a 14-bit ITU-N site ID exists, then a 24-bit ITU-N site ID cannot be assigned. If a 24-bit ITU-N site ID exists, then a 14-bit ITU-N site ID cannot be assigned.

Only one new point code parameter (**npc**, **npcpc**, **npcpca**, **npcpci**, **npcpcn**, or **npcpcn24**) can be specified.

If the **pcn**, **npcn**, **cpcn**, or **npcpcn** parameter is specified, the format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

The site CLLI code that is specified in the command cannot be the same as an existing route destination CLLI code.

The STP capability point code that is specified in the command cannot be the same as an existing STP capability point code.

The new STP capability point code that is specified in the command cannot be the same as an existing STP capability point code.

If the system is configured for ANSI format point codes, the specified network indicator value (*ni*) of the **pc**, **cpc**, or **npcpc** parameter must be **6** or greater when the specified cluster value (*nc*) is **0**.

The true point code and capability point codes cannot be the same as existing secondary point codes.

The existing true point code cannot be changed if it is in the MAP table.

The maximum number of capability point codes that can be provisioned is 96.

If the existing spare ITU-I or spare ITU-N point code is an STP destination point code, then the **npci=none** or **npcn=none** parameter (respectively) cannot be specified.

The parameter value **none** cannot be specified for the **cpc**, **cpca**, **cpci**, **cpcn**, and **cpcn24** parameters.

The STP destination point code that is specified in the command cannot be the same as an existing route **dpc** or **cpc**.

The new STP capability point code that is specified in the command cannot be the same as the STP destination point code.

The specified **pci** or **pcn** parameter value must already exist as an STP destination point code.

If the **npc/npca/npci/npcn/npcn24** parameter is specified, then the **cpc/cpca/cpci/cpcn/cpcn24** must be specified.

The G-Flex feature must be turned on to change the capability point code if the **cpctype=gflex** parameter is specified.

The G-Port feature must be enabled before the **cpctype=gport** parameter can be specified.

If the A-Port or the IS41 GSM Migration (IGM) feature is not enabled, the **cpctype=mnnp** parameter cannot be specified.

If the A-Port or IGM feature is enabled, the **cpctype=gport** parameter cannot be specified.

Could not add or change the (new) capability point code to the list due to software error.

The ATINP feature must be enabled before the **cpctype=atinpq** parameter can be specified.

If a value of **aiq** or **atinpq** is specified for the **cpctype** parameter, then the **pcn24** parameter cannot be specified.

The V-Flex feature must be turned on before the **cpctype=vflex** parameter can be specified.

The ANSI41 AIQ feature must be enabled before the **cpctype=aiq** parameter can be specified.

The values specified for the **cpc/cpca/cpci/cpcn**, **ncpc/ncpca/ncpci/ncpn**, **npc/npca/npci/npcn**, and **pc/pca/pci/pcn** parameters cannot be the same as any Emulated Point Code value in the PCT table.

Notes

If one of the **pc/pca/pci/pcn/pcn24** parameters is specified to change the point code, the following message is displayed:

```
CAUTION: SYSTEM SITE ID HAS BEEN CHANGED, MANUAL RE-INITIALIZATION IS
NEEDED
```

If the redirect function refers to any of the **pc/pca** or **cp/cpca** parameters, the following message is displayed:

```
CAUTION: SYSTEM SITE ID WAS REFERENCED BY THE REDIRECT FUNCTION'S DPC
```

In order for the change to be fully implemented, you must enter the **init-sys** command. This initializes the entire system system, and reloads all LIMs with the new self ID.

Only one ITU-N Site ID point code can be defined at one time (**pcn** or **pcn24**). To change from one to the other, the current Site ID must be disabled before the new one can be defined.

When the **cpctype=lnp** parameter is specified, it associates a specific service or capability (for example, local number portability query response and message relay service) with one or more of the capability point codes.

After the **cpctype** is defined, it cannot be changed.

For initial installation of a system, the self point code must be entered before any destination is entered.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

When the Site ID is changed, manual initialization is required because an MSU can be in transition between a link card and an SCCP card at the time the SID table is changed. In that case, it is possible for the Destination True Point Code to no longer appear to belong to the STP node, and SCCP would not know what to do with it. The following message is displayed:

```
CAUTION: SYSTEM SITE ID HAS BEEN CHANGED, MANUAL RE-INITIALIZATION IS
NEEDED
```

The **chg-sid** command is used to identify the STP in the signaling network. STP identity is determined by the Common Language (CLLI) code and the SS7 Destination/True Point Code (DPC). For MTP message discrimination, the STP can also be identified by one or more optional capability codes representing service-related SCCP capabilities resident at the STP.

The CLLI and DPC are used as paired key fields in SEAS to uniquely identify the STP and all SEAS interactions with that STP. This command is viewed as the first command to be used in provisioning a newly commissioned STP or an STP that is being reactivated in a new location or at a new network address.

The **chg-sid** command can also be used to add capability codes to the existing set for that STP after the CLLI and DPC have been initialized. Alternatively, the STP CLLI and DPC can be provisioned locally during installation, and the command used only to add new capability codes. The STP's own CLLI must be provisioned before SEAS-STP communication, in order to support UAL-level interactions.

If the **chg-sid** command is used to change only the capability point code, then the system does not need to be initialized to enable the change.

The **cpctype=vflex** parameter is used to support incoming messages (DPC = CPC) that are routed through Final GTT to the EAGLE 5 ISS V-Flex subsystem.

If the CLLI of the system is entered or changed with the **chg-sid** command, and the SEAS Over IP feature is turned on, then the CCS MR configuration must be changed to include the new EAGLE 5 ISS CLLI value. The following warning message appears:

CAUTION: System CLLI has changed, CCSMR re-configuration required

The **cpctype=aiq** parameter is used to support incoming messages (DPC = CPC) that are routed through Final GTT to the EAGLE 5 ISS AIQ subsystem.

Output

```
chg-sid:pc=10-20-30
  rlgncxa03w 04-01-07 09:17:40 EST EAGLE 31.3.0
  CHG-SID: MASP A - COMPLTD
;
```

chg-slt

Change Signaling Link Test Message

Use this command to change the fields of a signaling link test message (SLTM) record in the SLTM table.

Keyword: **chg-slt**

Related Commands: **chg-l3t, ent-ls, rtrv-ls, rtrv-slt**

Command Class: Database Administration

Parameters

:sltset= (mandatory)

Signaling link test message record number in the SLTM table.

Range: **1-20**

:enabled= (optional)

Enables the signaling link test message.

Range: **on, off**

Default: No change to the current value

:mode= (optional)

SLTM mode to be used when sending test messages.

Range: **special, regular**

special—All SLTMs generated by the links in the linkset associated with this SLTM record are designated “special” maintenance messages.

regular—All SLTMs generated by the links in the linkset associated with this SLTM record are designated “regular” maintenance messages.

Default: No change to the current value

:pattern= (optional)

Test pattern to be sent with a signaling link test message.

Range: *aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa*

2 to 30 alphanumeric characters; valid characters are **0-9, a-f, A-F**.

An even number of characters must be used in the pattern. The first two characters of the pattern must be letters.

Default: No change to the current value

:t1= (optional)

Timer 1. After an SLTM test fails, this parameter specifies the amount of time, in milliseconds, to wait before running the SLTM test again.

Range: **4000-12000**

Default: No change to the current value

:t2= (optional)

Timer 2. This parameter specifies the amount of time, in milliseconds, that should pass between running SLTM tests for a normally functioning signaling link.

Range: **30000-90000**

Default: No change to the current value

Example

```
chg-slt:sltset=1:t1=4000:t2=39000:enabled=off:pattern=aabbccdd
```

Dependencies

The value of **t1** should be greater than the level 3 timer **t6**. The level 3 timer **t6** can be **100 to 2000** milliseconds. Enter the **rtrv-l3t** command to verify the value of the level 3 timer **t6**.

Notes

None

Output

```
chg-slt:sltset=1:t1=4000:t2=39000:enabled=off:pattern=aabbccdd
rlghncxa03w 04-01-07 00:21:41 EST EAGLE 31.3.0
CHG-SLT: MASP A - COMPLTD
;
```

chg-srvsel**Change Service Selector**

Use this command to assign the applicable service selectors required to change a service entry for DSM services.

Keyword: **chg-srvsel**

Related Commands: **dlt-srvsel, ent-srvsel, rtrv-srvsel**

Command Class: Database Administration

Parameters

NOTE: Definitions for the feature options specified by the on and off parameters are located in the Notes section.

NOTE: The nature of address indicator parameters (naiv or nai) and the numbering plan parameters (npv or np) can be specified using a mnemonic or an explicit value. Either the mnemonic or the explicit value can be specified: however, both values cannot be specified at

the same time for the same parameter. Table A-7 shows the mapping between the **naiv** and **nai** values. Table A-8 shows the mapping between the **npv** and **np** values.

:gti/gtia/gtii/gtin/gtin24= (mandatory)

Global title indicator. For all service selector commands, the domain is defined as **gti** and **gtia** (ANSI), **gtii** (ITU international), **gtin** (ITU national) and **gtin24** (24-bit ITU national). For the service selector commands, **gti** and **gtia** are equivalent.

Range: Supported value for ANSI: **gti=2** and **gtia=2**
Supported values for ITU: **gtii=2, 4; gtin=2, 4, gtin24=2, 4**

:ssn= (mandatory)

Subsystem number.

Range: **0-255 ***

:tt= (mandatory)

Translation type.

Range: **0-255**

:nai= (optional)

Nature of address indicator.

Range: **sub, rsvd, natl, intl**

Default: No change to the current value

:naiv= (optional)

Nature of address indicator value.

Range: **0-127**

Default: No change to the current value

:ndftact= (optional)

New default action ID associated with the service selector entry.

Range: *ayyyyyyy*

1 leading alphabetic character followed by up to 8 alphanumeric characters

The **ndftact** parameter must have one of the following values:

- a valid GTT Action ID that exists in the GTT Action table and has a GTT Action of **disc/udts/tcaperr**
- **fallback**—Fallback to the relay data. The relayed MSU is routed using routing data provided by the service.
- **falltogtt**—Fallback to GTT. If the **gttselid** parameter has a value other than **none**, and the GTT selector search fails, then the GTT selector search is performed again using **gttselid=none**.

Default: No change to the current value

:ngtselid= (optional)

New GTT Selector ID. This parameter specifies the new ID used to perform GTT on the message relayed by the service.

Range: **0-65534 none**

none—deletes the current value of the **gttselid** field

Default: No change to the current value

:np= (optional)

Numbering plan.

Range: **e164, generic, x121, f69, e210, e212, e214, private**

Default: No change to the current value

:npv= (optional)

Numbering plan value.

Range: 0-15

Default: No change to the current value

:nserv= (optional)

New DSM service.

NOTE: The gport service cannot be used for the Prepaid SMS Intercept Phase 1 (PPSMS) or the Portability Check for Mobile Originated SMS feature; use the smsmr service. The mnp service includes the G-Port, A-Port, and IS41-to-GSM Migration services.

Range: eir, gflex, gport, inpq, inpmr, smsmr, idpr, idps, mnp, vflex, atinp, ttr, aiq

eir — Equipment Identity Register

gflex — GSM flexible numbering

gport — GSM number portability

inpq — INP query

inpmr — INP message relay

smsmr — Prepaid SMS Intercept Phase 1, Portability Check for Mobile Originated SMS, MO-based GSM SMS NP, MO-based IS41 SMS NP, MO SMS IS41-to-GSM Migration, MO SMS ASD, MO SMS GRN, MO SMS B-Party Routing.

idpr — Prepaid IDP Query Relay

idps — IDP Screening for Prepaid

mnp — Mobile Number Portability

vflex — V-Flex

atinp — ATI Number Portability Query (ATINP)

ttr — Triggerless TCAP Relay

aiq — ANSI41 AnalyzedInformation Query

Default: No change to the current value

:nsnai= (optional)

New service nature of address indicator.

Range: sub, natl, intl, rnidn, rnrndn, rnsdn, none, ccrndn

sub — Subscriber number

natl — National significant number

intl — International number

rnidn — Routing number prefix and international dialed/directory number

rnrndn — Routing number prefix and national dialed/directory number

rnsdn — Routing number prefix and subscriber dialed/directory number

none — The **nsnai** is not associated with the new DSM service.

ccrndn — Country code, routing number, and national directory number

Default: No change to the current value

:nsnp= (optional)

New service numbering plan.

Range: e164, e212, e214, none

e164 — E.164 numbering plan

e212 — E.212 numbering plan

e214 — E.214 numbering plan

none — The **nsnp** is not associated with the new DSM service.

Default: No change to the current value

:off= (optional)

Disables or turns off the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned off. Up to 10 feature options can be specified in the list.

Range: gtrrqd

:on= (optional)

Enables or turns on the specified feature options. This parameter specifies a comma separated list of feature options that are requested to be turned on. Up to 10 feature options can be specified in the list.

Range: gtrrqd

Example

```
chg-srvsel:gti=2:tt=10:ssn=250:nserv=gflex
chg-
srvsel:gtin=4:tt=0:ssn=100:np=e164:nai=intl:nsnp=e164:nsnai=rnidn
chg-srvsel:gtin24=4:tt=4:np=e164:ssn=50:nai=intl:nsnai=rnidn
chg-srvsel:gtii=4:tt=4:np=e164:nai=intl:ssn=10:nserv=eir
chg-
srvsel:gtii=4:tt=4:np=e164:nai=intl:ssn=12:nserv=gport:on=gtrrqd:
ngttselid=4:ndfltact=act1
```

Dependencies

The G-Flex feature must be turned on before the **nserv=gflex** parameter can be specified.

The INP feature must be turned on before the **nserv=inpnr** or **nserv=inpq** parameter can be specified.

The G-Port feature must be turned on before the **nserv=gport** parameter can be specified.

The Equipment Identity Register (EIR) feature must be turned on before the **nserv=eir** parameter can be specified.

The **nsnp**, **nsnai**, **nserv**, **ndfltact**, **ngttselid**, **on**, or **off** parameter must be specified.

The values **1** and **3** are not valid for the **gti/gtia/gtii/gtin/gtin24** parameters.

The **gtia=4** parameter cannot be specified. The value **4** is not valid for the **gtia** parameter.

If the **gti/gtia/gtii/gtin/gtin24=2** parameter is specified, then the **np(v)** and **nai(v)** parameter combinations cannot be specified.

If the **gtii/gtin/gtin24=4** parameter is specified, then an **np(v)** and **nai(v)** parameter combination must be specified. The parameters can be specified in these combinations: **np** and **naiv**, **npv** and **nai**, **np** and **nai**, or **npv** and **naiv**.

The **np** and **npv** parameters cannot be specified together in the command.

The **nai** and **naiv** parameters cannot be specified together in the command.

If the **nserv** parameter has a value of **inpnr**, **inpq**, **gport**, or **eir**, then the **gtia** and **gti** parameters cannot be specified.

If the **nserv=inpnr** parameter is specified, then the **nsnp=e164** parameter must be specified.

If the value specified for the **nsnai** parameter is **rnidn**, **rnnidn**, or **rnsdn**, then the value specified for the **nserv** parameter must be **inpnr**, **gport** or **smsmr**.

If the **nserv=inpq** parameter is specified, then the **gtii** parameter cannot be specified.

If a value of **aiq**, **atinp**, **eir**, **idpr**, **idps**, **inpq**, **ttr**, or **vflex** is specified for the **nserv** parameter, then only a value of **none** can be specified for the **nsnai** or **nsnp** parameter.

If the **nserv=gflex** parameter is specified, then the **nsnai=none** and **nsnp=none** parameters cannot be specified.

If the **nserv=inpnr** parameter is specified, then the **nsnai** parameter must be specified.

An entry must already exist that exactly matches the **gti/gtii/gtin/gtin24**, **tt**, **ssn**, **np(v)**, and **nai(v)** combination of parameters.

If the **nsnai=ccrndn** parameter is specified, then the value specified for the **nserv** parameter must be **gport** or **smsmr**.

If the value specified for the **nserv** parameter is **inpmr**, **smsmr** or **gport**, then the **nsnp=e164** parameter must be specified.

If the value specified for the **nserv** parameter is **gflex**, **gport**, **inpmr**, or **smsmr**, then the **nsnai** and **nsnp** parameters must be specified.

The **nsnai=none** parameter can be specified only if the value specified for the **nserv** parameter is **atinp**, **eir**, **idps**, **inpq**, **idpr**, **ttr**, or **vflex**.

If the **ansigflex** STP option is enabled (see the **chg-stpotps** command), then an ITU Service Selector cannot be entered.

The Prepaid IDP Query Relay feature must be turned on or the IAR Base feature must be enabled before the **nserv=ttr** parameter can be specified.

If a value of **idpr** or **ttr** is specified for the **nserv** parameter, then the only valid mandatory service parameters are **gtii**, **gtin**, **ssn**, and **tt**, and the only valid optional parameters are **np** and **nai**.

The IDP Screening for Prepaid feature must be turned on before the **nserv=idps** parameter can be specified.

When the **nserv=idps** parameter is specified, the only valid optional service parameters are **np** and **nai**.

If the **nserv=idps** parameter is specified, then the only valid mandatory service parameters are **tt**, **serv**, **ssn**, **gtin**, and **gtii**.

The V-Flex feature must be turned on before the **nserv=vflex** parameter can be specified.

The PPSMS or Portability Check for MO SMS feature must be turned on, or the MO SMS ASD, MO SMS GRN, MO SMS IS41-to-GSM Migration, MO SMS B-party Routing, MO-based GSM SMS NP, or MO-based IS41 SMS NP feature must be enabled before the **nserv=smsmr** parameter can be specified.

The ATINP feature must be enabled before the **nserv=atinp** parameter can be specified.

If a value of **aiq** or **atinp** is specified for the **nserv** parameter, then the **gtin24** parameter cannot be specified.

If the A-Port or IGM feature is enabled, then the **nserv=gport** parameter cannot be specified.

The Prepaid IDP Query Relay feature must be turned on before the **nserv=idpr** parameter can be specified.

The ANSI41 AIQ feature must be enabled before the **nserv=aiq** parameter can be specified.

The A-Port or IGM feature must be turned on, or the A-Port or IGM feature must be enabled and the G-Port feature must be turned on before the **nserv=mnp** parameter can be specified.

If a DSM4G card is active in the system, then the **on=gttrqd** parameter cannot be specified.

The **ndftact**, and **ngttselid**, **on=gttrqd**, and **off=gttrqd** parameters are supported for the IDPR, TTR, MNP, GPORT, SMSMR, GFLEX, and INPMR services.

If a GTT Action ID is specified as the value for the **ndftact** parameter, then the Action ID must already exist in the GTT Action table.

The value specified for the **ndftact** parameter must be **fallback**, **falltogtt**, or a valid GTT Action ID with an associated GTT Action of **disc/udts/tcaperr**.

The EGTT feature must be turned on before the **ngttselid** or **ndftact** parameter can be specified.

The same values cannot be specified for the **on** and **off** parameters.

The **ndfltact=none** parameter cannot be specified.

Notes

on/off options

- **gttrqd**—GTT required. Specifies whether GTT is required after service execution is complete and the message is relayed by the service. This option is supported for the IDPR, MNP, TTR, GPORT, SMSMR, GFLEX, and INPMR services.

Output

```
chg-srvsel:gti=2:tt=10:ssn=25:nerv=aiq
tekelecstp 09-12-03 16:40:40 EST EAGLE 42.0.0
Service Selector table is (115 of 1024) 11% full
CHG-SRVSEL: MASP A - COMPLTD

chg-ss-appl

Change Subsystem Application

Use this command to change the application status in the database.

Keyword: **chg-ss-appl**

Related Commands: **dlt-ss-appl**, **ent-ss-appl**, **rtrv-ss-appl**

Command Class: Database Administration

Parameters

:appl= (mandatory)

Application type.

Range: **lnp, inp, eir, vflex, atinpq, aiq**

:nstat= (mandatory)

Status.

Range: **offline, online**

Example

```
chg-ss-appl:appl=lnp:nstat=offline
chg-ss-appl:appl=atinpq:nstat=online
```

Dependencies

The LNP feature must be turned on before the **appl=lnp** parameter can be entered.

The INP feature must be turned on before the **chg-ss-appl:appl=inp** command can be entered.

The Equipment Identity Register (EIR) feature must be turned on before the **chg-ss-appl:appl=eir** command can be entered.

The application type (**appl** parameter) must already exist in the SS-APPL table.

The subsystem must be in the opposite state of the requested change.

The subsystem must be inhibited before **status=offline** can be specified.

Application type must exist in the LNP database

Application type not in SS-APPL table

The V-Flex feature must be turned on before the **appl=vflex** parameter can be specified.

The ATINP feature must be enabled before the **appl=atinpq** parameter can be specified.

The ANSI41 AIQ feature must be enabled before the **appl=aiq** parameter can be specified.

Notes

After the LNP subsystem is inhibited before performing an LNP ELAP bulk download, **chg-ss-appl:appl=lnp:nstat=offline** must be entered to ensure that the subsystem remains down through Service Module card replacements and reloads.

Output

```
chg-ss-appl:appl=aiq:nstat=offline
tekelecstp 09-12-03 13:35:40 EST EAGLE 42.0.0
CHG-SS-APPL: MASP A - COMPLTD
;
```

chg-ss7opts**Change SS7 Options**

Use this command to update (change by simple replacement) the values of one or more of the SS7 option indicators maintained in the STP Options table. SS7 options can modify normal handling of SS7 traffic.

Keyword: chg-ss7opts

Related Commands: rtrv-ss7opts

Command Class: Database Administration

Parameters

:ddbaudtimer= (optional)

Dynamic database audit timer. This parameter specifies the amount of time, in minutes, between the end of an automatic dynamic database audit and the beginning of the next automatic dynamic database audit.

Range: 5-1440 none
none—disables the automatic dynamic database audit

Default: No change to the current value

System

Default: 10

:discardtfc= (optional)

This parameter enables and disables the handling of TFC traffic from ITU-I networks. If enabled, TFC traffic from ITU-I networks will be discarded.

Range: on, off
on—Discard TFC ITU-I traffic
off—Do not discard TFC ITU-I traffic

System

Default: off

:discardtfcn= (optional)

This parameter enables and disables the handling of TFC traffic from ITU-N networks. If enabled, TFC traffic from ITU-N networks will be discarded.

Range: on, off
on—Discard TFC ITU-N traffic
off—Do not discard TFC ITU-N traffic

System

Default: off

:lsrestrict= (optional)

Use the restricted linkset routing determination algorithm. This parameter enables and disables the restricted linkset routing determination algorithm on a system-wide basis.

Range: **on, off**
on—Restrictive linkset routing enabled; route traffic on the least restrictive available route with the lowest cost.
off—Restrictive linkset routing disabled; route traffic on the lowest cost route.

Default: No change to the current value

System

Default: **off**

:msgpri2itui= (optional)

Message Priority to ITUI. This parameter specifies the priority for messages that cross to an ITUI network.

Range: **0-3 dflt**
dflt—Messages retain their original functionality.
0-3—The priority for any MSU crossing to an ITUI network is set to the provisioned value. MSUs crossing to ANSI networks are not affected.

Default: No change to the current value

System

Default: **dflt**

:msgpri2itun= (optional)

Message Priority to ITUN. This parameter specifies the priority for messages that cross to an ITUN or ITUN-24 network.

Range: **0-3 dflt**
dflt—Messages retain their original functionality.
0-3—The priority for any MSU crossing to an ITUN or ITUN-24 network is set to the provisioned value. MSUs crossing to ANSI networks are not affected.

Default: No change to the current value

System

Default: **dflt**

:slanpcorgopc= (optional)

This parameter specifies whether to copy the originating point code (OPC) from the incoming MSU to the **stplan** application.

Range: **on, off**
on— Copy the OPC from the incoming MSU to the **stplan** application.
off— Do not copy the OPC from the incoming MSU to the **stplan** application.

System

Default: **off**

:slanlsn= (optional)

SLAN linkset name. This parameter specifies whether to copy the incoming and outgoing linkset names into the STPLAN message format.

Range: **on, off**
on— Copy the incoming and outgoing linkset names into the STPLAN message format.
off— Do not copy the incoming and outgoing linkset names into the STPLAN message format.

Default: No change to the current value

System

Default: **off**

:slsreplace= (optional)

Signaling link selector replace. This parameter enables the EAGLE 5 ISS to replace the SLS for an ANSI message.

The **randsls=perls** parameter must be specified in the **chg-stpopts** command before the SLS can be replaced.

Range: **no, yes**
no— Do not replace the SLS in an outgoing message with a randomly generated SLS.
yes— Replace the SLS in an outgoing message with a randomly generated SLS.

Default: No change to the current value.

System

Default: **no**

Example

```
chg-ss7opts:lsrestrict=on
chg-ss7opts:slanporgopc=on
chg-ss7opts:slsreplace=yes
chg-ss7opts:ddbbaudtimer=5
chg-ss7opts:ddbbaudtimer=none
chg-ss7opts:slanlsn=on
```

Dependencies

At least one optional parameter must be specified.

When the **lsrestrict** option is **on**, the **tfatcabmlq** parameter value for C linksets can be changed to a non-zero value (see the **chg-ls** command). If the **tfatcabmlq** parameter in any C linkset has been changed to a non-zero value, the **tfatcabmlq** value must be set back to **0** for all C linksets before the **lsrestrict** option can be turned off.

The STP LAN feature must be turned on (see the **chg-feat** command) before the **slanporgopc** or **slanlsn** parameter can be specified.

Notes

None

Output

```
chg-ss7opts:slanporgopc=on
tekelecstp 08-09-26 15:22:38 EST EAGLE 39.2.0
CHG-SS7OPTS: MASP B - COMPLTD
;
chg-ss7opts:slanlsn=on
tekelecstp 09-01-05 13:19:42 EST EAGLE 40.1.0
CHG-SS7OPTS: MASP B - COMPLTD
;
```

chg-stpopts**Change STP Options**

Use this command to change the values of one or more of the STP node level processing option indicators maintained in the STP's options table. All values are assigned initially to system defaults at STP installation time, and they may be updated subsequently using this command.

NOTE: For those STP option attributes supporting STP event message throttling, the values for the indicated parameters shall become effective in the next event-message output interval following their activation. All other updates shall be effective immediately, as of the time of activation.

Keyword: **chg-stpopts**

Related Commands: **rtrv-stpopts**

Command Class: Database Administration

Parameters

NOTE: As of Release 42.0, the **ansigflex**, **archbldid**, **cnvcgda**, **cnvcgdi**, **cnvcgdn**, **cnvcgdn24**, **gtcnvdfilt**, **critalminh**, **dispactalms**, **mtplprst**, **mtplti**, **mtprsi**, **rptlnpmrssi**, **rstrdev**, or **uimrd** parameter can be set individually or using the on/off parameters.

NOTE: If the **cnvcgda**, **cnvcgdi**, **cnvcgdn**, or **cnvcgdn24** parameter has a value of **no** (or a value of **cnvcgda**, **cnvcgdi**, **cnvcgdn**, or **cnvcgdn24** is specified for the off parameter), and the CGPA cannot be converted during processing, then the MSU is discarded.

:ansigflex= (optional)

This parameter enables ANSI G-Flex to execute at 1700 TPS per DSM card.

Range: **yes, no**
 yes— Enabled
 no— Disabled

Default: No change to the current value

System

Default: **no**

:archbldid= (optional)

Archive build ID. This parameter specifies whether the database archive file name contains the EAGLE 5 ISS build number instead of the release number.

Range: **on, off**
 on— The file name contains the build number.
 off— The file name contains the release number.

Default: No change to the current value

System

Default: **off**

:cnvcgda= (optional)

This parameter enables discarding of the CGPA point code in SCCP messages if the destination network type is ANSI, and the point code or alias point code of the destination network type is not defined.

Range: **yes, no**
 yes—Enabled
 no—Disabled

Default: No change to the current value

System

Default: **no**

:cnvcgdi= (optional)

This parameter enables discarding of the CGPA point code in SCCP messages if the destination network type is ITU-I, and the point code or alias point code of the destination network type is not defined.

Range: **yes, no**
 yes— Enabled
 no— Disabled

Default: No change to the current value

System

Default: **no**

:cnvcgdn= (optional)

This parameter enables discarding of the CGPA point code in SCCP messages if the destination network type is ITU-N, and the point code or alias point code of the destination network type is not defined.

Range: **yes, no**
 yes — Enabled
 no — Disabled

Default: No change to the current value

System

Default: **no**

:cnvcgdn24= (optional)

This parameter enables discarding of the CGPA point code in SCCP messages if the destination network type is ITU-N24, and the point code or alias point code of the destination network type is not defined.

Range: **yes, no**
 yes — Enabled
 no — Disabled

Default: No change to the current value

System

Default: **no**

:critalminh= (optional)

Critical alarm inhibit. This parameter enables inhibiting of critical alarms.

Range: **yes, no**
 yes — Enabled
 no — Disabled

Default: No change to the current value

System

Default: **no**

:defcc= (optional)

Default country code.

Range: 1-3 digits, **none**
 Valid digits are **0-9, A-F, a-f**.
 none—Deletes the current value.

Default: No change to the current value

:defndc= (optional)

Default network destination code.

Range: 1-5 digits, **none**
 Valid digits are **0-9, A-F, a-f**.
 none—Deletes the current value.

Default: No change to the current value

:dispactalms= (optional)

Display active alarms. This parameter displays active or total alarms in the alarm status area of the VT320 screen (see Figure 4-1). The alarm status area comprises four boxes to show counts for critical, major, minor, and inhibited alarms. When total alarms are displayed (**dispactalms=no**), the counts for critical, major, and minor alarms include any temporarily or permanently inhibited alarms. The alarm status area is labeled *Total Alarm Status*. When active alarms are displayed (**dispactalms=yes**), the counts for critical, major, and minor alarms do not include any temporarily or permanently inhibited alarms. The alarm status area is labeled *Active Alarm Status*. This parameter does not affect the count displayed in the inhibited box; the number of inhibited alarms is always displayed.

Range: **yes, no**
 yes — Enabled; active alarm status is displayed
 no — Disabled; total alarm status is displayed

Default: No change to the current value

System**Default:** no**:dsmaud=** (optional)

Service Module card audit running state.

Range: on, off, ccc**on**— Running**off**— Not running**ccc**— Running with Corruption Cross Correction enabled. EAGLE 5 ISS LNP, G-Flex, G-Port, INP, or V-Flex systems contain $n+1$ Service Module cards (maximum 32)

running the VSCCP application. Each of the Service Module cards contains a full image of the RTDB database. If a record within the RTDB database on any card should become corrupted, a mate Service Module card can supply the corrected data. The

dsmaud=ccc parameter enables the Corruption Cross Correction function used by the system to obtain the correct data from a mate Service Module card.**Default:** No change to the current value**System****Default:** off**:gsmdecerr=** (optional)

GSM MAP screening decode error action.

Range: pass, discard**Default:** No change to the current value**System****Default:** pass**:gsmdflt=** (optional)

GSM MAP screening default action.

Range: pass, discard**Default:** No change to the current value**System****Default:** pass**:gtcnvflt=** (optional)

This parameter enables routing of SCCP messages using system defaults when an appropriate entry is not found in the Default GT Conversion Table.

Range: yes, no**yes**— Enabled**no**— Disabled**Default:** Current value**System****Default:** no**:mtpdpcq=** (optional)MTP destination point code quantity. This parameter specifies the maximum number of DPCs that can be provisioned from the STP. The value of this parameter is dependent directly on the number of x-list entries that can be provisioned using the **mtpxlq** parameter. If the number of destinations that can be provisioned is increased, the number of x-list entries that can be maintained is decreased.**Range:** 500-10000**500-2000**—if the DSTN5000 feature bit is not turned on**500-5000**—if the DSTN5000 feature bit is turned on**500-6000**—if the 6000 Routesets feature is enabled**500-7000**—if the 7000 Routesets feature is enabled**500-8000**—if the 8000 Routesets feature is enabled**500-10000**—if the 10,000 Routesets feature is enabled

Default: No change to the current value

System

Default: 2000

:mtplprst= (optional)

MTP low priority route set test. This parameter specifies whether low priority route set polling is enabled or disabled at the STP.

Range: **yes, no**
yes — Enabled
no — Disabled

Default: Current value

System

Default: yes

:mpltctdpcq= (optional)

MTP loop test congestion trigger DPC quantity. This parameter specifies the number of most frequently occurring DPCs to which the MTP loop test messages are to be sent when the MTP loop test is triggered by congestion.

Range: **3-10**
Default: No change to the current value

System

Default: 3

:mplti= (optional)

MTP loop test indicator. This parameter specifies whether the MTP loop detection procedures are enabled or disabled at the STP.

Range: **yes, no**
yes — Enabled
no — Disabled

Default: Current value

System

Default: yes

:mpltst= (optional)

MTP loop test supervision timer. This parameter specifies the amount of time, in milliseconds, that the MTP loop test detection procedures run when started.

Range: **10000-20000**
Default: Current value

System

Default: 10000

:mtprsi= (optional)

MTP Restart indicator. This parameter specifies whether ANSI and ITU MTP Restart procedures are enabled at the STP.

Range: **yes, no**
yes — enable restart procedures
no — do not enable restart procedures

Default: Current value

System

Default: no

:mtprsit= (optional)

ANSI MTP Restart isolation timer. This parameter specifies the minimum duration of node isolation, in milliseconds, before the ANSI MTP Restart procedure is deemed necessary.

Range: **2000-900000**

Default: No change to the current value
System
Default: 5000

:mtp10alt= (optional)

MTP T10 alternate timer, in milliseconds. This parameter specifies the interval at which the STP performs a route set test on low priority routes. The value of the **mtp10alt** parameter must be equal to or greater than the value of the level 3 T10 timer.

Range: 20000-10000000
Default: No change to the current value
System
Default: 30000

:mtp31ctl= (optional)

MTP T31 congestion trigger level. This parameter specifies the signaling link congestion level at which the system starts the level 3 t31 timer. When the level 3 t31 timer expires, the associated signaling link is removed from service for realignment.

Range: 1-2
Default: No change to the current value
System
Default: 1

:mtpxlet= (optional)

MTP x-list expiration time. This parameter specifies the maximum amount of time the system maintains an unreferenced dynamic status exception list (x-list) entry. This parameter must be specified in one of the following formats: *mm*, *hmm*, *hhmm*, where *m* is minutes and *h* is hours. For example, **43** is 43 minutes, **138** is 1 hour 38 minutes, and **2400** is 24 hours.

Range: 0020-2400
Default: No change to the current value
System
Default: 0100

:mtpxlot= (optional)

MTP x-list occupancy threshold. This parameter specifies the dynamic status exception list (x-list) occupancy threshold at which the system raises a minor alarm. The threshold is expressed as a percentage of space available.

Range: 0-100
Default: No change to the current value
System
Default: 90

:mtpxlq= (optional)

MTP x-list quantity. This parameter specifies the number of dynamic status exception list (x-list) entries the system maintains. The value of this parameter is dependent directly on the number of destinations that are provisioned using the **mtpdpcq** parameter.

Range: 500-10000
 500-2000—if the DSTN5000 feature bit is not turned on
 500-5000—if the DSTN5000 feature bit is turned on
 500-6000—if the 6000, 7000, or 8000 Routesets feature is enabled
 500-10000—if the 10,000 Routesets feature is enabled
Default: Current value
System
Default: 500

:npcfnti= (optional)

ITU National Point Code Format Identifier. This parameter specifies how the ITU national point code is entered into the database and how it is displayed in any outputs from the system. The ITU national point code is a 14-bit integer. The point codes can be a single number up to five digits, or two, three, or four numbers separated by dashes. This parameter specifies the number of bits to allow in each position of the four members.

Range: *m1-m2-m3-m4*

Four members where each member represents the number of bits allowed in the corresponding position for a flexible ITU national point code. The range of each member (*m1-m4*) is from **0** to **14**. Each member must be specified no matter how many numbers the point code format contains, and the sum of *m1+m2+m3+m4* must equal 14 (for example, **npcfnti=7-7-0-0**, or **npcfnti=0-6-8-0**). Table 5-15 defines the values of the parts of the ITU national point code.

Table 5-15. NPCFMTI Parameter - ITU National Point Code Values

Number of Bits in Point Code Section								
Bit	0	1	2	3	4	5	6	7
Range of Values	Not Used	0-1	0-3	0-7	0-15	0-31	0-63	0-127
Bit	8	9	10	11	12	13	14	
Range of Values	0-255	0-511	0-1023	0-2047	0-4095	0-8191	0-16383	

Table 5-16. Point Code Format Examples

NPCFMTI Value	Range of Point Code Values
7-7-0-0	0-0 to 127-127
0-6-8-0	0-0 to 63-255
0-0-4-10	0-0 to 15-1023
3-8-3-0	0-0-0 to 7-255-7
2-9-2-1	0-0-0-0 to 3-511-3-1
4-4-4-2	0-0-0-0 to 15-15-15-3
14-0-0-0	00000 to 16385

Default: No change to the current value

System

Default: **14-0-0-0**

:off= (optional)

Disables or turns off the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned off. Up to 8 feature options can be specified in the list.

Range: **ansigflex, archbldid, cnvcgda, cnvcgdi, cnvcgdn, cnvcgdn24, gtcnvdfit, critalminh, dispactalms, mtplprst, mtplti, mtpersi, rptlnpmrss, rstrdev, uimrd, mfc**

:on= (optional)

Enables or turns on the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned on. Up to 8 feature options can be specified in the list.

Range: **ansigflex, archbldid, cnvcgda, cnvcgdi, cnvcgdn, cnvcgdn24, gtcnvdfit, critalminh, dispactalms, mtplprst, mtplti, mtpersi, rptlnpmrss, rstrdev, uimrd, mfc**

:pct= (optional)

This parameter specifies the method used to apply PCT to MSUs.

Range: **off, on, lset**

off— do not apply PCT to any MSU

on— apply PCT to all MSUs

lset— apply PCT to MSUs that are coming in or going out on a link that belongs to a linkset where PCT is provisioned (see the **chg-lsopts** command)

Default: **off**

:randsls= (optional)

Random SLS (signaling link selection) option. This parameter enables the system to ignore the incoming SLS value and randomly generate a new SLS value to select an outgoing linkset and a link. This parameter is implemented independently of the ITU SLS Enhancement feature settings for individual linksets, which are defined by the **slsocbit** and **slsrsb** parameters of the **ent-ls** and **chg-ls** commands. The value specified for the **randsls** parameter in the **chg-stpopts** command will override the value specified for the **randsls** parameter for each individual linkset.

To enable random SLS generation per linkset, the **randsls=perls** parameter must be specified. When this parameter is specified, the SLS Bit Rotation capability (set with the **slsrsb** parameter of the **ent-ls** or **chg-ls** commands) is overridden, and cannot be used on individual linksets. The **ent-ls** or **chg-ls** commands do not prevent the user from provisioning with the parameter also enables the user to restrict Random SLS generation to Class 0 messages only.

This parameter is implemented independently of the ITU SLS Enhancement feature settings for individual linksets. These settings are specified by the **slsocbit** (Use of the Other CIC BIT capability) and **slsrsb** (SLS Bit Rotation capability) parameters of the **ent-ls** and **chg-ls** commands. When the ITU SLS Enhancement is turned on with either the **randsls=all** or **randsls=class0** parameters, the SLS Bit Rotation capability (set with the **slsrsb** parameter of the **ent-ls** or **chg-ls** commands) is overridden, and cannot be used on individual linksets. The **ent-ls** and **chg-ls** commands do not prevent the user from provisioning with the **slsrsb** parameter.

This parameter applies only to ITU SCCP messages.

Range: **class0, all, off, perls**

class0— Enables random SLS generation for Class0 SCCP traffic.

all— Enables random SLS generation for all SCCP traffic.

off— Disables random SLS generation.

perls— Enables random SLS generation on a per-linkset basis instead of a system-wide basis.

Default: No change to the current value
System
Default: **off**

:rptlnpmrssl= (optional)

Report LNP MR SS unequipped. This parameter specifies whether to generate UIN 1049 for LNP message relay (MR) messages with missing subsystems. If no MAP entry is found from a GTT done on an LNP MR message, the UIM is either displayed (**rptlnpmrssl=yes**) or suppressed (**rptlnpmrssl=no**). This setting applies only to LNP MR messages. All other messages display UIM 1049 when no MAP entry is found, regardless of this setting.

Range: **yes, no**
yes — Display UIM 1049 for all messages.
no — Do not display UIM 1049 for LNP MR with missing subsystems.

Default: No change to the current value
System
Default: **yes**

:rstrdev= (optional)

Restore device state. This parameter enables restoration of device states when the **init-sys** command is executed and when an OAM role change occurs and maintains the inhibited state of terminals, links, and cards.

CAUTION: An `init-sys` command causes the system to go down.

CAUTION

Range: **on, off**
Default: No change to the current value
System
Default: **off**

:secmtpmate= (optional)

This parameter enables security screening for MTP messages received by an STP on a non-C-Link, with an OPC equal to the SID (True, Adjacent, or Capability) point code of its mate.

Range: **off, notify, silent, test**
off — Screening is disabled; message is processed normally.
notify — Screening is enabled; UIM is generated and message is discarded.
silent — Screening is enabled; message is discarded. No UIM is generated.
test — Screening is enabled; UIM is generated and message is processed normally.

Default: No change to the current value
System
Default: **off**

:secmtpsid= (optional)

This parameter enables security screening for MTP messages received at MTP3 containing an OPC equal to its own SID (OPC that is the True, Secondary, or Capability point code entered in the **chg-sid** command) that is not a route-set-congestion-message. The system should not receive a message with its own OPC unless the message is a result of a circular route test or is an SLTM when the far end is in loopback. (SLTM messages are not checked.)

Range: **off, notify, silent, test**
off — Screening is disabled; message is processed normally.
notify — Screening is enabled; UIM is generated and message is discarded.
silent — Screening is enabled; message is discarded. No UIM is generated.
test — Screening is enabled; UIM is generated and message is processed normally.

Default: Current value

System**Default:** off**:secmtpsnm=** (optional)

This parameter enables security screening for MTP SNM messages. The system should not receive an MTP network management message unless:

- The OPC is an adjacent point code. (For all link types, this rule does not apply to UPU, TFC, and RCT messages.)
- The system has a route to the OPC of the MTP network management message on the linkset which the message was received.
- The system has a route to the destination field in the message (if applicable to the concerned message) on the linkset which the message was received. (For all link types, this rule does not apply to RST messages.)

Range: off, notify, silent, test

off— Screening is disabled; message is processed normally.

notify— Screening is enabled; UIM is generated and message is discarded.

silent— Screening is enabled; message is discarded. No UIM is generated.

test— Screening is enabled; UIM is generated and message is processed normally.

Default: No change to the current value**System****Default:** off**:secscpcsmg=** (optional)

This parameter enables security screening for SCCP SCMG messages. The system should not receive an SCCP network management message unless:

- The system has a route to the OPC of the SCMG message on the linkset on which the message was received.
- The system has a route to the Affected Point Code (Concerned Point Code) in the message on the linkset on which the message was received.

This parameter applies only to SSP and SOR messages. SSA, SST, SOG, SBR, SNR and SRT messages are not affected.

Range: off, notify, silent, test

off— Screening is disabled; message is processed normally.

notify— Screening is enabled; UIM is generated and message is discarded.

silent— Screening is enabled; message is discarded. No UIM is generated.

test— Screening is enabled; UIM is generated and message is processed normally.

Default: No change to the current value**System****Default:** off**:slscnv=** (optional)

Per node SLS conversion indicator.

Range: on, off, perls

on— SLS conversion is enabled on all linksets.

off— SLS conversion is disabled on all linksets.

perls— SLS conversion is enabled on a per linkset basis.

Default: No change to the current value**System****Default:** off

:tfatfrpr= (optional)

TFA/TFR pacing rate. This parameter specifies the amount of time, in milliseconds, between partial broadcasts of up to 20 percent increments of the number of TFAs/TCAs or TFRs/TCRs to be broadcast by the STP when an affected destination becomes accessible using its primary route rather than an alternate route. The STP uses this pacing to prevent congestion on the newly recovered linksets.

Range: **0-1000**
Set in increments of 100.

Default: No change to the current value

System

Default: **1000**

:uimrd= (optional)

Unsolicited Information Message (UIM) redirect indicator. This parameter specifies whether the UIMs are to be routed to the specified output group.

Range: **yes, no**
yes — Enabled
no — Disabled

Default: No change to the current value

System

Default: **no**

Example

```
chg-stpopts:mtpt31ctl=2:uimrd=yes
chg-stpopts:mtpxlq=1000:mtpxlet=0200:mtpxlot=75
chg-stpopts:npcfmti=4-4-4-2
chg-stpopts:rptlnpmrssi=no
chg-stpopts:rstrdev=on
chg-stpopts:cnvcgda=yes
chg-stpopts:randsls=perls
chg-stpopts:pct=on
chg-stpopts:mtpdpcq=10000
chg-stpopts:on=mfc
```

Dependencies

The values of the **mtpdpcq** and **mtpxlq** parameters are interdependent; that is, to increase the number of DPCs that can be provisioned, the number of x-list entries that the STP is to maintain must be decreased. Conversely, to increase the number of x-list entries that the STP maintains, the number of DPCs that can be provisioned must be decreased.

At least one optional parameter must be specified.

The ANSI/ITU SCCP Conversion feature must be enabled before the **cnvcgda**, **cnvcgdi**, **cnvcgdn**, **cnvcgdn24**, or **gtcnvdfilt** parameters can be specified.

The **ansigflex** option cannot be enabled if any of the following features is enabled:

- 1100 TPS/DSM for ITU NP
- A-Port
- AINPQ

- ATINP
- EIR
- G-Flex MAP Layer Routing
- G-Port
- Info Analyzed Relay Base
- INP
- IS41 GSM Migration
- Prepaid Short Message Intercept Phase 1 (PPSMS)
- MO SMS ASD
- MO SMS GRN
- MO SMS IS41-to-GSM Migration
- MO-based GSM SMS NP
- MO-based IS41 SMS NP
- Portability Check for MO SMS
- TIF Number Portability
- TIF Number Substitution
- TIF Subscr CgPN Blacklist
- V-Flex

The G-Flex feature must be on before the **ansigflex** option can be enabled.

The **ansigflex** option cannot be enabled when Service Selector table contains an ITU entry. (See the **chg-srvsel** command.)

When the **mtpxlet** parameter is specified, the value for minutes (*mm*) must be in the range **00-59**.

The DSTN5000 (5000 Routes) feature must be turned on before the **mtpdpcq** parameter value can be increased to more than **2000**.

When the number of x-list entries (the **mtpxlq** parameter) is specified, the total number of DPCs (the **mtpdpcq** parameter) and x-list entries provisioned cannot exceed the space available in the Route table.

When the number of DPCs (the **mtpdpcq** parameter) is specified, the total number of DPCs and x-list entries (the **mtpxlq** parameter) provisioned cannot exceed the space available in the Route table.

The number of DPCs provisioned (the **mtpdpcq** parameter) cannot be increased if space allocated for maintaining x-list entries becomes full.

The value for the **mtpdpcq** parameter cannot be less than the number of DPCs provisioned.

The Cluster Routing and Management Diversity (CRMD) feature must be turned on before the **mtpxlq**, **mtpxlet**, and **mtpxlot** parameters can be specified.

The ANSI MTP restart (MTPRS) feature must be turned on before the **mtprsit** parameter can be specified.

The ANSI MTP restart (MTPRS) or ITU MTP restart (ITUMTPRS) feature must be turned on before the **mtparsi** parameter can be specified.

The value for the **tfatfrpr** parameter must be specified in increments of 100 milliseconds (0.1 seconds).

If critical alarms are inhibited in the system, then the **criticalminh=no** parameter cannot be specified. If the **npcfnti** parameter is specified, the sum of the values specified for $m1+m2+m3+m4$ must be equal to 14.

The **defcc** parameter value cannot already exist as an entry in the GSM Options Multiple Country Code (the **multcc** parameter) list.

If a GSM Options Multiple Country Code (the **multcc** parameter) has been defined, the **defcc=none** parameter cannot be specified.

The GSM Map Screening feature must be turned on before the **gsmdflt** or **gsmdecerr** parameter can be specified.

The Network Security Enhancements feature must be turned on before the **secmtpmate**, **secmtpsid**, **secmtpsnm**, and **secscpcsmg** parameters can be specified.

If the Origin-based MTP Routing feature is enabled, then the **mtplprst=no** parameter cannot be specified.

The AINPQ, EIR, G-Flex, G-PORT, INP, LNP ELAP Configuration, Prepaid SMS Intercept Ph1, or V-Flex feature must be turned on before the **dsmaud** parameter can be specified.

The value specified for **mtpt10alt** parameter cannot be less than Level3-T10 timer value.

If the MT-Based GSM SMS NP feature is turned on, then the **defcc=none** parameter cannot be specified.

If the MT-Based IS41 SMS NP feature is turned on, then the **defcc=none** parameter cannot be specified.

If the ATINP feature is turned on, then the **defcc=none** parameter cannot be specified.

If the TN quantity key is above 228M, or if ELAP version 8.0 or above is provisioned, then the **dsmaud=ccc** parameter cannot be specified.

If the Prepaid IDP Relay feature is turned on or the IAR Base feature is enabled, then the **defcc=none** parameter cannot be specified.

If the **on** or **off** parameter is specified, then the **ansigflex**, **archblidid**, **cnvegda**, **cnvegdi**, **cnvegdn**, **cnvegdn24**, **gcnvdfit**, **criticalminh**, **dispactalms**, **mtplprst**, **mtplti**, **mtprsi**, **rptlnpmrss**, **rstrdev**, or **uimrd** parameter cannot be specified.

The same option cannot be specified by both the **on** and **off** parameters.

A PCT quantity feature must be enabled before the **pct** parameter can be specified.

Contact the Customer Care Center for assistance in turning Message Flow Control OFF.

Notes

If the database contains ITU national point codes of a particular format, and the format is changed with the **npcfnti** parameter of the **chg-stpopts** command, the format of the ITU national point codes in the database will be changed to the new format.

The format defined by the **npcfnti** parameter applies to all database entities that use ITU national point codes except gateway screening. Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If the system is using a format for the ITU national point code other than a single number, the point code will have to be converted from its current format to a single number in order to be used by gateway screening. The conversion is explained in "Converting ITU National Point Code Formats".

For the STP option attributes supporting STP event message throttling, the values for the indicated parameters become effective in the next event-message output interval following their activation. All other updates become effective at the time of activation (immediately).

When the **slscnv=on** parameter is specified with the **chg-stpopts** command, the node acts as if the 5-bit to 8-bit SLS conversion is being performed on every linkset in the database, even those linksets that have the **slsci=no** parameter specified for them.

When the **slscnv=off** parameter is specified with the **chg-stpopts** command, the node acts as if the 5-bit to 8-bit SLS conversion has been turned off for every linkset in the database, even those linksets that have the **slsci=yes** parameter specified for them.

When the **slscnv=perls** parameter is specified with the **chg-stpopts** command, the 5-bit to 8-bit SLS conversion is performed only on the linksets that have the **slsci=yes** parameter specified for them.

When the value of the **dispactalms** parameter is changed, there could be a delay of up to five seconds as the VT320 screen refreshes to the selected display.

The maximum allowed number of destination point codes can be changed by the **mtpdpcq** parameter. The maximum value of the **mtpdpcq** parameter is one of the following values:

- **5000** if the DSTN5000 feature bit is on
- **6000, 7000, 8000, or 10000** if the 6000, 7000, 8000, or 10,000 Routesets feature, respectively, is enabled
- **2000** if no Routes or Routesets feature is on

If the Cluster Routing and Management Diversity feature is turned on, the maximum number of destination point codes contained in the exception list can be changed by the **mtpxlq** parameter. The maximum value of the **mtpxlq** parameter is one of the following values:

- **2000** if no Routes or Routesets feature is on
- **5000** if the DSTN5000 feature is on
- **6000** if the 6000, 7000, or 8000 Routesets feature is enabled
- **10000** if the 10,000 Routesets feature is enabled

The sum of the values of the **mtpdpcq** and **mtpxlq** parameters can be increased beyond **2500** only if one or more of the following features is turned on:

- If the DSTN5000 feature is turned on, the **mtpdpcq** and **mtpxlq** parameters cannot exceed **5500**.
- If the 6000 Routesets feature is enabled, the **mtpdpcq** and **mtpxlq** parameters cannot exceed **6500**.
- If the 7000 Routesets feature is enabled, the **mtpdpcq** and **mtpxlq** parameters cannot exceed **7500**.
- If the 8000 Routesets feature is enabled, the **mtpdpcq** and **mtpxlq** parameters cannot exceed **8500**.
- If the 10,000 Routesets feature is enabled, the **mtpdpcq** and **mtpxlq** parameters cannot exceed **10500**.

To enter seconds (instead of milliseconds) for the timer values, the timer value must contain at least one decimal place, and can contain up to three decimal places. If no decimal places are entered, the system accepts the value as milliseconds. The **rtrv-stpopts** command always displays the output in milliseconds, not seconds.

on/off options

- **ansigflex**—Enables/Disables ANSI G-Flex to execute at 1700 TPS per DSM card
- **archblidid**—Archive build ID. Enables/Disables specifies that the database archive file name contains the EAGLE 5 ISS build number/release number respectively.
- **cnvcgda**—Enables/Disables discarding of the CGPA point code in SCCP messages if the destination network type is ANSI, and the point code or alias point code of the destination network type is not defined
- **cnvcgdi**—Enables/Disables discarding of the CGPA point code in SCCP messages if the destination network type is ITU-I, and the point code or alias point code of the destination network type is not defined
- **cnvcgdn**—Enables/Disables discarding of the CGPA point code in SCCP messages if the destination network type is ITU-N, and the point code or alias point code of the destination network type is not defined
- **cnvcgdn24**—Enables/Disables discarding of the CGPA point code in SCCP messages if the destination network type is ITU-N24, and the point code or alias point code of the destination network type is not defined
- **critalminh**—Critical alarm inhibit. This enables/disables inhibiting of critical alarms.
- **dispactalms**—Enables/Disables the display of active alarms in the alarm status area of the VT320 screen (see Figure 4-1). The alarm status area comprises four boxes to show counts for critical, major, minor, and inhibited alarms. The counts for critical, major, and minor alarms do not include any temporarily or permanently inhibited alarms. The alarm status area is labeled *Active Alarm Status*. This parameter does not affect the count displayed in the inhibited box; the number of inhibited alarms is always displayed
- **gtcnvdfit**—Enables/Disables routing of SCCP messages using system defaults when an appropriate entry is not found in the Default GT Conversion Table
- **mfc**—Enables/Disables Message Flow Control (MFC) functionality and disables/enables Group Ticket Voucher (TVG) functionality.
- **mtplprst**—Enables/Disables MTP low priority route set testing via polling the STP
- **mtplti**—Enables/Disables MTP loop detection procedures on the STP
- **mtprsi**—Enables/Disables the MTP Restart procedures (both ANSI and ITU) on the STP
- **rptlnpmrss**—Enables/Disables the generation of UIM 1049 for LNP message relay (MR) messages with missing subsystems if no MAP entry is found from a GTT done on an LNP MR message
- **rstrdev**—Enables/Disables restoration of device states when the **init-sys** command is executed and when an OAM role change occurs and maintains the inhibited state of terminals, links, and cards through an **init-sys** execution, OAM role change, and card reload. An **init-sys** command causes the system to go down.
- **uimrd**—Enables/Disables UIMs (Unsolicited Information Messages) to be routed to the specified output group

EPM-B based cards refer to E5-ATM-B, E5-ENET-B, and E5-MCPM-B cards.

Output

```
chg-stpopts: rands1s=all
tekelecstp 06-07-26 12:03:28 EST EAGLE 36.0.0
CHG-STPOPTS: MASP A - COMPLTD
;
```

chg-t1**Change T1 Interface**

Use this command to change an interface for a T1 card in the system. T1 cards consist of E1/T1 MIM cards or HC-MIM or E5-E1T1 cards used as T1 or ST-HSL-A cards.

NOTE: On HC-MIM and E5-E1T1 cards, T1 ports 1, 3, 5, and 7 (master ports) can be independently channel bridged with their adjacent even-numbered T1 ports 2, 4, 6, and 8 (slave ports) to allow non-signaling data pass-through.

Keyword: chg-t1

Related Commands: dlt-t1, ent-t1, rtrv-t1, tst-t1

Command Class: Database Administration

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:t1port= (mandatory)

T1 port number

The value must be a T1 port that has already been configured with a T1 interface on the specified T1 card.

Range: 1-8

Ports 3 - 8 can be specified only for HC-MIM and E5-E1T1 cards.

Any 2 of the 8 ports on an HC-MIM card can be specified when the card is used as an ST-HSL-A card.

Any 1 of the 8 ports on an E5-E1T1 card can be specified when the card is used as an ST-HSL-A card.

:chanbrdg= (optional)

Port bridging status. This parameter specifies whether an odd-numbered T1 port on an HC-MIM or E5-E1T1 card is channel bridged with its adjacent even-numbered T1 port for non-signaling data pass through.

Range: on, off

Default: No change to the current value

:encode= (optional)

Indicator for use of B8ZS or AMI encoding/decoding.

Range: b8zs, ami

Default: No change to the current value

:force= (optional)

This parameter specifies to provision an odd-numbered T1 port to channel bridging mode even if the adjacent next higher even-numbered port is already provisioned with a T1 interface.

Range: yes, no

:framing= (optional)

Indicator for framing format.

Range: sf, esf, esfperf

esfperf — esf framing format with performance monitoring.

Default: No change to the current value

:ll= (optional)

T1 cable length in feet between the EAGLE 5 ISS and the connecting node.

Range: 0 - 655

Default: No change to the current value

:minsurate= (optional)

Minimum signal unit rate. This parameter specifies the minimum number of SUs present on a link that are uniformly distributed.

The **linkclass=unchan** parameter (see the **ent-t1** command) must be specified in the T1 interface before this parameter can be specified.

Range: 400-1600

Default: No change to the current value

:t1tsel= (optional)

Timing source for a T1 card.

Range: line, external, recovered

line — slave timing source

external — master timing source

recovered — timing source recovered from the paired master port for channel bridged slave ports

Default: No change to the current value

Example

```
chg-t1:loc=1205:t1port=1:encode=ami:t1tsel=external
```

```
chg-t1:loc=1205:t1port=2:encode=b8z:ll=250s
```

```
chg-t1:loc=1205:t1port=3:chanbrdg=on:t1tsel=recovered
```

```
chg-t1:loc=1205:t1port=1:minsurate=1000
```

Dependencies

At least one optional parameter must be specified.

The specified card location (**loc** parameter) must be equipped.

The card specified by the **loc** parameter must be a **limt1** card type.

The port specified by the **t1port** parameter must have already been configured with a T1 interface on the specified T1 card.

All signaling links that are serviced by the specified T1 card (**loc** parameter) must be deactivated before the values for the **encode**, **t1tsel**, **ll**, and **framing** parameters can be changed. See the **dlt-slk** command to delete the signaling links.

If an even-numbered T1 port on an HC-MIM or E5-E1T1 card is used, then the **chanbrdg=on** parameter cannot be specified.

If the **chanbrdg=on** parameter is specified, then the **t1tsel** parameter must be specified.

The **t1tsel=recovered** parameter can be specified only when the status of the specified T1 port on the HC-MIM or E5-E1T1 card is channel-bridged master.

The **force=yes** parameter must be specified to provision an odd-numbered T1 port to channel bridging mode on an HC-MIM or E5-E1T1 card if the adjacent next higher even-numbered port is already provisioned with a T1 interface.

Parameter values cannot be changed for the even-numbered T1 port interface (**t1port** parameter) in a channel bridged pair. The values must be changed in the odd-numbered port interface.

Before an odd-numbered T1 port (**t1port** parameter) on an HC-MIM or E5-E1T1 card can be provisioned into channel bridging mode (**chanbrdg=on** parameter), all signaling links assigned to its next higher even-numbered adjacent T1 port must be deleted. See the **dlt-slks** command to delete the signaling links.

The fan feature bit must be on before HC-MIM cards can be used in an EAGLE 5 ISS shelf (see the **chg-feat** command). The system checks the fan feature bit when an HC-MIM card is present in the specified odd card location (**loc** parameter) and the **chanbrdg=on** parameter is specified.

HIPR cards must be equipped in card locations xy09 and xy10 (x is the frame, y is the shelf) on each EAGLE 5 ISS shelf that contains one or more HC-MIM or E5-E1T1 cards. The system checks for HIPR cards when the **chanbrdg=on** parameter is specified for HC-MIM or E5-E1T1 cards.

Card locations 1113, 1114, 1115, 1116, 1117, 1118 (OAM, TDM, MDAL cards) cannot be specified as values for the **loc** parameter.

The **chanbrdg** parameter can be specified only for HC-MIM or E5-E1T1 cards that are used as T1 cards. The parameter cannot be specified if the cards are used as ST-HSL-A cards.

If the value specified by the **loc** parameter refers to a T1 card, then the **chanbrdg=on** parameter cannot be specified.

Line (slave) timing cannot be used with channel bridging. If the **t1tsel=line** parameter is specified for a T1 port on an HC-MIM or E5-E1T1 card with T1 port status of channel bridged with external (master) timing, then the **chanbrdg=off** parameter must be specified. If the **chanbrdg=on** parameter is specified for a T1 port on an HC-MIM or E5-E1T1 card that uses T1 port line (slave) timing, then the **t1tsel=recovered** parameter or the **t1tsel=external** parameter must be specified.

The **linkclass=unchan** parameter must be specified (see the **ent-t1** command) before the **minsurate** parameter can be specified. If the **linkclass=unchan** parameter is specified, then the **chanbrdg=on** parameter cannot be specified.

The ST-HSL-A feature must be turned on before the **framing=esfperf** parameter can be specified.

Notes

External timing is derived from the EAGLE 5 ISS High-Speed Master Clock (1.544 MHz for T1 or 2.048 MHz for E1); therefore, the Master Timing feature is required. Line timing is derived from its received data stream, if present.

Output

```
chg-t1:loc=1205:t1port=1:encode=ami:t1tsel=external
r1ghncxa03w 04-01-20 09:07:58 EST EAGLE 31.3.0
CHG-T1: MASP A - COMPLTD
;
```

chg-tatr-msg

Change Triggerless ANSI TCAP Relay Message

Use this command to revise a Triggerless ANSI TCAP Relay message.

Keyword: **chg-tatr-msg**

Related Commands: **rtrv-tatr-msg**, **tst-msg**

Command Class: Database Administration

Parameters

:msgn= (mandatory)

Message number. This parameter specifies the number of the TATR message.

Range: 1-10

:active= (optional)

This parameter specifies whether the TATR message is sent to the network card for processing.

Range: **yes, no**
 yes — The message is sent to the network card.
 no — The message is not sent to the network card.
Default: No change to the current value
System
Default: **no**

- :cdpadgts=** (optional)
 Called party address digits. This parameter specifies the SCCP CdPA digits for the IAR message.
Range: 1-15 digits
 1 - 15 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
Default: No change to the current value
- :cdpagt=** (optional)
 Called party address global title. This parameter specifies the SCCP CdPA GT for the IAR message.
Range: **0-15**
Default: No change to the current value
- :cdpagtnai=** (optional)
 Called party address global title nature of address indicator. This parameter specifies the SCCP CdPA GT NAI for the IAR message.
Range: **0-127**
Default: No change to the current value
- :cdpndgts=** (optional)
 Called party number digits. This parameter specifies the TCAP CdPN digits for the IAR message.
Range: 1-32 digits
 1 - 32 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
Default: No change to the current value
- :cdpnai=** (optional)
 Called party number Nature of Address Indicator. This parameter specifies the value for TCAP CdPN NAI value for the IAR message.
Range: **0-255**
Default: No change to the current value
- :cgpapgts=** (optional)
 Calling party address digits. This parameter specifies the SCCP CgPA digits for the IAR message.
Range: 1-15 digits
 Range is 1 - 15 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
Default: No change to the current value
- :cgpagt=** (optional)
 Calling party address global title. This parameter specifies the SCCP CgPA GT for the IAR message.
Range: **0-15**
Default: No change to the current value
- :cgpagtnai=** (optional)
 Calling party address global title nature of address indicator. This parameter specifies the SCCP CgPA GT NAI for the IAR message.
Range: **0-127**
Default: No change to the current value
- :cgpndgts=** (optional)
 Calling party number digits. This parameter specifies the TCAP CgPN digits in the IAR message.
Range: 1-32 digits
 1 - 32 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.

Default: No change to the current value

:cgpnai= (optional)

Calling party number nature of address indicator. This parameter specifies the TCAP CgPN NAI in the IAR message.

Range: 0-255

Default: No change to the current value

:reset= (optional)

This parameter resets all of the parameters to their default values.

Range: yes

yes — Resets all message parameters to their default values

Default: No change to the current value

:trigtype= (optional)

Trigger Type. This parameter specifies the value for the *TrigType* field of the IAR message.

Range: 0-255

The value for the **trigtype** parameter can be entered as a decimal value (0-255) or as 2 hexadecimal digits. Valid digits are 0-9, a-f, A-F.

If hexadecimal digits are used, then the digits must be preceded by *h'*. Table 5-22 lists valid hexadecimal values.

Default: No change to the current value

Example

```
chg-tatr-
msg:mgn=1:trigtype=h'26:cdpnai=4:cdpadgts=12457896abcd:cgpnai=
4
```

```
chg-tatr-
msg:mgn=1:trigtype=12:cdpnai=2:cdpndgts=981123456:active=yes
```

Dependencies

The IAR Base feature must be enabled before this command can be entered.

If the **reset** parameter is specified, then no other parameters can be specified.

At least one optional parameter must be specified.

Output

```
chg-tatr-
msg:mgn=1:trigtype=37:cdpnai=4:cdpndgts=987654321:cgpnai=4
tekelecstp 09-07-07 15:58:08 EST EAGLE 41.1.0
CHG-TATR-MSG: MASP A - COMPLTD
;
```

chg-tatropts

Change TATR Options

Use this command to enter Triggerless ANSI TCAP Relay (TATR)-specific options in the database. This command updates the TATROPTS table.

Keyword: chg-tatropts

Related Commands: rtrv-tatropts

Command Class: Database Administration

Parameters

:cdnptype= (optional)

Entity type for CdPN RTDB lookup. This parameter specifies the entity type that is considered a success when used for RTDB lookup.

Range: **sp, rn, rnsdp, anymatch, always, rnsdpn**

sp— Service provider

rn— Routing number

rnsdp— **rn** or **sp**

anymatch— **rn, sp**, or no match with any entity

always— Lookup is always considered successful

rnsdpn— **rn, sp**, or **dn**

If the **cdnptype=anymatch** parameter is specified, then the value is also used as the RN for the outgoing CdPN.

Default: No change to the current value

System

Default: **rnsdp**

:cgnptype = (optional)

CgPN database lookup type. This parameter specifies the entity type that is considered a success when used for RTDB lookup.

Range: **sp, rn, rnsdp, anymatch, always, rnsdpn**

sp— Service Provider

rn— Routing Number

rnsdp— **rn** or **sp**

anymatch— **rn, sp**, or no match with any entity

always— Lookup is always considered successful

rnsdpn— **rn, sp**, or **dn**

If the **cgnptype=anymatch** parameter is specified, then the value is also used as the RN for the outgoing CgPN.

Default: No change to the current value

System

Default: **rnsdp**

:cgpaccck= (optional)

CgPA country code check. This parameter specifies whether a DEFCC check is performed on the incoming CgPA.

Range: **always, nonintl, off**

always— The DEFCC check is always performed.

nonintl— The DEFCC check is performed if the CdPN NAI is not 'International'.

off— The DEFCC check is not performed.

Default: No change to the current value

System

Default: **nonintl**

:dfitrn= (optional)

Default routing number. This parameter specifies the default RN that is used when a value of **sp** or **rnsdp** is specified for the **cdnptype** or **cgnptype** parameter, and the CdPN or CgPN RTDB lookup returns entity type SP.

Range: 1-15 digits, **none**

1-15 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.

none—a default RN is not used

Default: No change to the current value

System**Default:** none**:sporttype=** (optional)

Service Portability type. This parameter specifies whether Service Portability is performed for the Info Analyzed Relay (IAR) NP feature.

NOTE: The S-Port feature must be turned on before any change to the parameter will impact the associated feature.

NOTE: If Service Portability is performed, then the Service Portability prefix (RTDB 'GRN'entity id) is applied.

Range: gsm, is41, all, none

gsm, none— Apply Service Portability prefix for own-network GSM subscribers

is41, none— Apply Service Portability prefix for own-network IS41 subscribers

all, none— Apply Service Portability prefix for all own-network (IS41 and GSM) subscribers

none—Service Portability is not performed for the feature.

Default: No change to the current value**System****Default:** none**Example**

```
chg-tatropts:cdnptype=always:sporttype=is41
```

```
chg-tatropts:cgnptype=sp
```

```
chg-tatropts:cgpaccck=always
```

```
chg-tatropts:df1trn=123456789012345
```

Dependencies

At least one optional parameter must be specified.

The IAR Base feature must be enabled before this command can be entered.

The IAR Number Portability and the Service Portability features must be enabled before the **sporttype** parameter can be specified.

Output

```
chg-tatropts:cdnptype=sp
tekelecstp 09-07-05 13:34:22 EST EAGLE 41.1.0
CHG-TATROPTS: MASP A - COMPLTD
;
```

chg-th-alm**Change Alarm Thresholds**

Use this command to change the alarm thresholds and associated values.

Keyword: chg-th-alm**Related Commands:** rept-stat-sccp, rtrv-th-alm**Command Class:** Database Administration**Parameters****:gttservlv1=** (optional)

The percentage for the SCCP GTT Service error ratio level 1 (lower) Threshold Alarm.

Range: 1-100**Default:** 10

:gttserlv2= (optional)

The percentage for the SCCP GTT Service error ratio level 2 (upper) Threshold Alarm.

Range: 1-100

Default: 20

:imtbusutllv1= (optional)

The percentage for the IMT Bus Combined utilization level 1 Threshold Alarm (reported on IMT System).

Range: 35-70

Default: 70

:imtbusutllv2= (optional)

The percentage for the IMT Bus Combined utilization level 2 Threshold Alarm (reported on IMT System).

Range: 40-80

Default: 80

:imtcongestlv1= (optional)

The percentage for the IMT Bus Congestion level 1 Threshold Alarm (reported on HIPR2 card).

Range: 35-70

Default: 70

:imtcongestlv2= (optional)

The percentage for the IMT Bus Congestion level 2 Threshold Alarm (reported on HIPR2 card).

Range: 40-80

This value must be greater than the value specified for the **imtcongestlv1** parameter.

Default: 80

:lnptndblv1= (optional)

The percentage for the TN Database provisioned level 1 (lower) Capacity Threshold Alarm.

Range: 1-100

Default: 80

:lnptndblv2= (optional)

The percentage for the LNP TN Database provisioned level 2 (upper) Capacity Threshold Alarm.

Range: 1-100

The specified value must be greater than the **lnptndblv1** parameter value.

Default: 95

:nongttserlv1= (optional)

The percentage for the SCCP Non-GTT Service (AIQ, ATINPQ, GPORT, GFLEX, EIR, INPMR, INPQS, LNPQR, LNPQS, LRNQT, PLNPQS, TLNP, V-Flex, WNPQS) error ratio level 1 (lower) Threshold Alarm.

Range: 1-100

Default: 10

:nongttserlv2= (optional)

The percentage for the SCCP Non-GTT Service (AIQ, ATINPQ, GPORT, GFLEX, EIR, INPMR, INPQS, LNPQR, LNPQS, LRNQT, PLNPQS, TLNP, V-Flex, WNPQS) error ratio level 2 (upper) Threshold Alarm.

Range: 1-100

Default: 20

:sccpcalcmtbd= (optional)

Calculation method used to determine whether the TPS Threshold Alarm levels have been exceeded.

Range: n, nplus1

n— use all In Service Normal cards in the calculation
nplus1— use all In Service Normal cards minus 1 card in TPS calculation

Default: **n**

:sccpthlv1intvl= (optional)

Number of minutes during which the SCCP threshold level 1 alarm cannot be raised more than once.

Range: **0-1440**

Default: **0**

:sccpthlv2intvl= (optional)

Number of minutes during which the SCCP threshold level 2 alarm cannot be raised more than once.

Range: **0-1440**

Default: **0**

:sccptscap= (optional)

The percentage for the SCCP Load Capacity Threshold Alarm.

Range: **0-100**

Default: **80**

:thermallv1= (optional)

Thermal Alarm Level 1 as a percentage of a card's thermal limit.

Range: **73-92**

:thermallv2= (optional)

Thermal Alarm Level 2 as a percentage of a card's thermal limit.

Range: **74-100**

Example

```
chg-th-alm:lnptndblv1=85
chg-th-alm:sccptscap=85
chg-th-alm:sccpalcmthd=nplus1
chg-th-alm:gttserlvlv1=25:gttserlvlv2=28
chg-th-alm:sccpthlv1intvl=20:sccpthlv2intvl=50
chg-th-alm:nongttserlvlv1=30:nongttserlvlv2=60
```

Dependencies

Each Level 1 parameter value must be less than its corresponding Level 2 parameter value.

Notes

To display the currently configured values for the Thermal Alarm Levels, use the **rtv-th-alm** command.

HC MIM cards have a thermal operating limit of 82 degrees Celsius. EPM based E5-E1T1, E5-ATM, E5-ENET, E5-IPSM, and E5-TSM cards have a thermal operating limit of 95 degrees Celsius. E5-SM4G and EPM-B based cards have a thermal operating limit of 90 degrees Celsius. Thermallv1 and thrmallv2 are applicable to both EPM and EPM-B based cards.

The thermal threshold values represent a percentage of the thermal operating limit of a card.

EPM-B based cards refer to E5-ATM-B, E5-ENET-B, and E5-MCPM-B cards.

Output

```
chg-th-alm:thermallv1=85
rlghncxa03w 06-05-07 11:43:04 EST EAGLE 35.0.0
CHG-TH-ALM: MASP A - COMPLTD
;
```

chg-tifopts**Change TIF Options**

Use this command to update the TIF Options table.

NOTE: Values other than none that are entered for the dlma - dlmc parameters for the TIF services (TIF, TIF2, TIF3) using this command will overwrite values entered for those parameters using the chg-npp-serv command.

Keyword: chg-tifopts

Related Commands: rtrv-tifopts

Command Class: Database Administration

Parameters

:condcgpn= (optional)

This parameter specifies the preconditioning required when a CgPN lookup is needed.

Range: **adcc, none**
adcc, none — add the country code

Default: **none**

:crprel= (optional)

This parameter specifies the ISUP Release cause for a message that is determined to be circular routed.

Range: **0-255**
Default: **31** - normal, unspecified

:dfftrn= (optional)

Default routing number. This parameter provides a set of digits to substitute for a signalling point. This parameter is used with both calling party and called party numbers.

Range: 1-15 digits, **none**
 1-15 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.

Default: **none**

:dlma= (optional)

Delimiter A. This parameter specifies the digits used for Delimiter A in an NPP Formatting Action.

Range: 1-16 digits, **none**
 1-16 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.

Default: **none**

:dlmb= (optional)

Delimiter B. This parameter specifies the digits used for Delimiter B in an NPP Formatting Action.

Range: 1-16 digits, **none**
 1-16 hexadecimal digits. Valid digits are 0-9, a-f, A-F.

Default: **none**

:dlmc= (optional)

Delimiter C. This parameter specifies the digits used for Delimiter C in an NPP Formatting Action.

Range: 1-16 digits, **none**
 1-16 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.

Default: **none**

:iamcgpn= (optional)

This parameter specifies the format of the outgoing CgPN digits.

Range: **rn, rndn, dn**
rn — Replaces the CgPN with the RN.
rndn — Adds the RN as a prefix to the CgPN.

- dn** — Replaces the CgPN with the DN.
- Default:** **dn**
- :matchseq=** (optional)
This parameter specifies the DN lookup mechanism.
- Range:** **dn, nptype**
dn — search the range database if the DN is not found during subscriber lookup
nptype — search the range database if the DN is not found during subscriber lookup or if the located DN does not match the value specified for the **nptype** or **nptypecgpn** parameter
- Default:** **dn**
- :npflag=** (optional)
This parameter specifies whether the **nm** parameter is modified in the IAM message to show that NP lookup has been performed.
The nm parameter exists only in incoming and outgoing IAM messages.
- Range:** **nm, none, none**
nm, none — modifies the **nm** parameter
none, none — does not modify the **nm** parameter
- Default:** **none**
- :nptypecgpn=** (optional)
NP entity type for the CgPN. This parameter specifies the entity type of the DN that is used to indicate that a successful NP lookup occurred.
- Range:** **sp, rn, sprn, all, rnspsdn, any**
sp — signaling point
rn — routing number
sprn — Lookup is successful if the value of the entity type is **sp** or **rn**.
all — Lookup is always considered successful.
rnspsdn — Lookup is successful if the value of the entity type is **rn, sp, or dn**.
any — Lookup is successful if the value of the entity type is **rn, sp, or no match with any entity**.
- Default:** **sprn**
- :nptyperls=** (optional)
This parameter specifies the entity type of the DN that is used to indicate that a successful NP lookup occurred for the NPRLS and NPNRLS Service Actions.
- Range:** **sp, rn, sprn, all, rnspsdn, any**
sp — signaling point
rn — routing number
sprn — Lookup is successful if the value of the entity type is **sp** or **rn**.
all — Lookup is always considered successful.
rnspsdn — Lookup is successful if the value of the entity type is **rn, sp, or dn**.
any — Lookup is successful if the value of the entity type is **rn, sp, or no match with any entity**.
- Default:** No change to the current value
- System**
- Default:** **sprn**
- :nptyperly=** (optional)
This parameter specifies the entity type of the DN that is used to indicate that a successful NP lookup occurred for the NPRELAY Service Action.
- Range:** **sp, rn, sprn, all, rnspsdn, any**
sp — signaling point
rn — routing number

sprn — Lookup is successful if the value of the entity type is **sp** or **rn**.

all — Lookup is always considered successful.

rnsprd — Lookup is successful if the value of the entity type is **rn**, **sp**, or **dn**.

any — Lookup is successful if the value of the entity type is **rn**, **sp**, or no match with any entity.

Default: No change to the current value

System

Default: **sprn**

:nsaddldata= (optional)

This parameter specifies whether the incoming IAM Calling Party Category should be compared with the value for the **nspublic** parameter before performing Calling Party number substitution.

Range: **yes, no**

yes — Compare the Calling Party Category in the message with the **nspublic** parameter value.

no — Do not compare the Calling Party Category in the message with the **nspublic** parameter value.

Default: **no**

:nspublic= (optional)

The value of the Calling Party Category that indicates that the Calling Party number is public.

Range: **0-255**

Default: **0**

:rcausenp= (optional)

The value used for the release cause in an REL message when number portability occurs.

Range: **0-127**

Default: **0**

:rcausepfx= (optional)

The value used for the release cause in an REL message when number portability does not occur.

Range: **0-127**

Default: **0**

:rlcopc= (optional)

This parameter specifies whether the value specified for the **rcause** parameter (see the **ent/chg-dstn** commands) overrides the values specified for the **rcausenp** and **rcausepfx** parameters.

Range: **off, on**

off — Use the values specified for the TIFOPTS **rcausenp** and **rcausepfx** parameters as the release cause in REL messages.

on — Use the value specified for the **rcause** parameter as the release cause in REL messages.

Default: **off**

:rnrqd= (optional)

This parameter specifies whether the redirection number is included in the release message when release handling is indicated.

Range: **yes, no**

Default: **yes**

:sncgpndflt= (optional)

The digits to be used in calling number simple number substitution.

Range: 1-32 digits, **none**
 1-32 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
Default: **none**

:spfill= (optional)

This parameter specifies whether the **sp** entity type is populated if the value specified for the **defltrn** or **grn** parameter is used for NPP processing.

Range: **off, on**
off— do not populate the **sp** entity type
on— populate the **sp** entity type

Default: No change to the current value

System

Default: **off**

:splitiam= (optional)

This parameter specifies when to split the IAM into IAM + 1 SAM.

Range: **15-31, none**

Default: **none**

:sportrelay= (optional)

This parameter specifies the Service Portability configuration option for the NPRELAY Service Action.

Range: **none, gsm, is41, all**
none— Service Portability is not performed for this Service Action
gsm— Apply Service Portability prefix (RTDB 'GRN' entity id) for own-network GSM subscribers
is41— Apply Service Portability prefix (RTDB 'GRN' entity id) for own-network IS41 subscribers
all— Apply Service Portability prefix ('GRN' from RTDB entity) for all own-network (IS41 and GSM) subscribers

Default: No change to the current value

System

Default: **none**

:sportrls= (optional)

This parameter specifies the Service Portability configuration option for the NPRLS Service Action.

Range: **none, gsm, is41, all**
none— Service Portability is not performed for this Service Action
gsm— Apply Service Portability prefix (RTDB 'GRN' entity id) for own-network GSM subscribers
is41— Apply Service Portability prefix (RTDB 'GRN' entity id) for own-network IS41 subscribers
all— Apply Service Portability prefix ('GRN' from RTDB entity) for all own-network (IS41 and GSM) subscribers

Default: No change to the current value

System

Default: **none**

Example

```
chg-tifopts:dlma=1234567890
chg-tifopts:df1trn=123456789012345
chg-tifopts:nptype=all
chg-tifopts:nsaddldata=yes:nspublic=5
```

Dependencies

At least one optional parameter must be specified.

At least one of the following features must be enabled before this command can be entered.

- TIF Additional Subscriber Data
- TIF Generic Routing Number
- TIF Number Portability
- TIF Number Substitution
- TIF Range CgPN Blacklist
- TIF SCS Forwarding
- TIF Simple Number Substitution
- TIF Subscriber CgPN Blacklist

If the TIF ASD feature is turned on, then the **matchseq=nptype** parameter cannot be specified.

If the TIF GRN feature is turned on, then the **matchseq=nptype** parameter cannot be specified.

The TIF Number Portability feature must be enabled before the **matchseq=nptype** parameter can be specified.

If the TIF Number Substitution feature is enabled, then the **matchseq=nptype** parameter cannot be specified.

The TIF Number Substitution feature must be enabled before the **nsaddldata** parameter or the **nspublic** parameter can be specified.

If the **matchseq=nptype** parameter is specified, then the only value that can be specified for the **sportrelay** or **sportrls** parameter is **none**. If the **sportrelay** or **sportrls** parameter has a value other than **none**, then the **matchseq=nptype** parameter cannot be specified.

The S-Port feature must be enabled before the **sportrelay** or **sportrls** parameter can be specified.

Notes

None

Output

```
chg-tifopts:nsaddldata=yes:nspublic=5
tekelecstp 09-03-05 09:36:03 EST EAGLE 41.0.0
CHG-TIFOPTS: MASP A - COMPLTD
;
```

chg-trm

Change Terminal

Use the change terminal command to configure the operational characteristics of each of the 40 terminal ports used to connect modems, printers, and terminals to the system.

Keyword: chg-trm

Related Commands: act-echo, canc-echo, chg-trm, dact-echo, inh-trm, rept-stat-trm, rmv-trm, rst-trm, rtrv-trm

Command Class: Database Administration

Parameters**:trm=** (mandatory)

Terminal. This parameter specifies the ID number of the terminal whose characteristics are to be changed.

Range: 1-40

:all= (optional)

This parameter specifies whether to display unsolicited messages of all types (TRAF, LINK, SA, DB, SYS, PU, UIMRD, APPSERV, APPSS, CARD, CLK, DBG, GTT, GWS, MEAS, MON, MPS, SEAS, SLAN) in the scroll area.

Range: **yes, no**
yes—Receive all.
no—Receive none.

Default: **yes**—If **type=emsalm** is specified
 Current value—if **type** parameter value is not **emsalm**

:appserv= (optional)

Application server. This parameter specifies whether to display UAMs and UIMs assigned to the Application Server output group in the scroll area.

Range: **yes, no**
yes—Receive all.
no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **appserv** value.
 If **type=emsalm** is specified—**yes**

System

Default: **no**

:appss= (optional)

Application subsystem. This parameter specifies whether to display UAMs and UIMs assigned to the Application Subsystem output group in the scroll area

Range: **yes, no**
yes—Receive all.
no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **appss** value.
 If **type=emsalm** is specified—**yes**

System

Default: **no**

:baud= (optional)

This parameter specifies the line speed (baud rate) for this terminal's serial port connection.

Range: 2400, 4800, 9600, 19200, 38400, 57600, 115200
 Values 38400, 57600, and 115200 are only valid when the OAMHC is used.

Default: No change to the current value

System

Default: 9600

:card= (optional)

This parameter specifies whether to display UAMs and UIMs assigned to the Card output group in the scroll area.

Range: **yes, no**
yes—Receive all.
no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **card** value.
 If **type=emsalm** is specified—**yes**

System

Default: **no**

:clk= (optional)

Clock. This parameter specifies whether to display UAMs and UIMs assigned to the Clock output group in the scroll area.

Range: **yes, no**
yes—Receive all.
no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **clk** value.
 If **type=emsalm** is specified—**yes**

:db= (optional)

Database. This parameter specifies whether to display database-related unsolicited messages in the scroll area.

Range: **yes, no**
yes—Receive all.
no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **db** value.
 If **type=emsalm** is specified—**yes**

System

Default: **no**

:dbg= (optional)

Debug. This parameter specifies whether to display UAMs and UIMs assigned to the Debug output group in the scroll area.

Range: **yes, no**
yes—Receive all.
no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **dbg** value.
 If **type=emsalm** is specified—**yes**

System

Default: **no**

:dural= (optional)

Terminal lockout time. This parameter specifies the length of time the terminal is disabled after each failed login/unlock attempt in excess of the threshold configured on the **mxinv** parameter. The value can be specified as seconds (*ss*); minutes and seconds (*mmss*); or hours, minutes, and seconds (*hhmmss*).

Range: **0-999999**
0-59 (*ss*)
0-5959 (*mmss*)
0-995959 (*hhmmss*)
999999

Default: No change to the current value

System

Default: **100** - 1 minute, 0 seconds

:fc= (optional)

Flow control. This parameter specifies the type of flow control used to regulate the flow of data between the system and an RS-232 connected device, so that no characters are lost (especially at high baud rates). The control setting of the system and the connected device must match.

Range: **hw, sw, both, none**
hw — hardware flow control
sw — software flow control
both — hardware and software flow control
none — neither hardware nor software flow control

NOTE: If E5-MASP hardware is used, then a value of hw or both cannot be specified for the fc parameter.

Default: No change to the current value

System

Default: **sw**

:gtt= (optional)

This parameter specifies whether to display UAMs and UIMs assigned to the GTT output group in the scroll area.

Range: **yes, no**
yes—Receive all.
no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **gtt** value.
 If **type=emsalm** is specified—**yes**

:gws= (optional)

This parameter specifies whether to display UAMs and UIMs assigned to the GWS output group in the scroll area.

Range: **yes, no**
yes—Receive all.
no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **gws** value.
 If **type=emsalm** is specified—**yes**

System

Default: **no**

:link= (optional)

This parameter specifies whether to display link maintenance-related unsolicited messages in the scroll area.

Range: **yes, no**
yes—Receive all.
no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **link** value.
 If **type=emsalm** is specified—**yes**

:logintmr= (optional)

Login timer. This parameter specifies the amount of time, in seconds, allowed for a user to log into a Telnet terminal after selecting the terminal.

This parameter applies to Telnet terminals.

Range: **3-600 none**
none—Login can occur at any time after selecting the terminal.

Default: No change to the current value

System

Default: none

:logoutmr= (optional)

Logout timer. This parameter specifies the amount of time, in seconds, before the Telnet session closes after the user manually or automatically logs out.

This parameter applies to Telnet terminals.

Range: **0-1200** none
none—The Telnet session does not close after logout.

Default: No change to the current value

System

Default: none

:meas= (optional)

Measurement. This parameter specifies whether to display UAMs and UIMs assigned to the Measurements Maintenance output group in the scroll area.

Range: **yes, no**
yes—Receive all.
no—Receive none.

Default: If **all** is specified—current **all** value
If **all** is not specified—current **meas** value.
If **type=emsalm** is specified—**yes**

System

Default: no

:mon= (optional)

Monitor. This parameter specifies whether to display UAMs and UIMs assigned to the Monitor output group in the scroll area.

Range: **yes, no**
yes—Receive all.
no—Receive none.

Default: If **all** is specified—current **all** value
If **all** is not specified—current **mon** value.
If **type=emsalm** is specified—**yes**

:mps= (optional)

This parameter specifies whether to display UAMs and UIMs assigned to the MPS output group in the scroll area.

Range: **yes, no**
yes—Receive all.
no—Receive none.

Default: If **all** is specified—current **all** value
If **all** is not specified—current **mps** value.
If **type=emsalm** is specified—**yes**

:mxinv= (optional)

Login/unlock failure threshold. When a login or unlock failure occurs on a terminal, a counter of successive login failures is incremented by one. After the increment, if the counter is greater than or equal to the mxinv parameter value, the system sends an information message to all system administrator ports and locks out the port temporarily. The port is locked out for an interval that is specified in the dural parameter.

To disable the info message and temporary lockout function for the terminal, specify **mxinv=0**.

Range: **0-9**

Default: No change to the current value

System**Default:** 5 - successive failed login/unlock attempts**:pngfailcnt=** (optional)

Ping fail count. This parameter specifies the number of consecutive ping fails that must occur before the Telnet connection is dropped.

This parameter applies to Telnet terminals or to EMSALM terminals that have Telnet connections.

Range: 1-10**Default:** No change to the current value**System****Default:** 1**:pngtimeint=** (optional)

Ping time out. This parameter specifies the amount of time, in milliseconds, that must pass before the IPSPM card initiates a new ping cycle.

This parameter applies to Telnet terminals or to EMSALM terminals that have Telnet connections.

Range: 100-1200000 none

none—Pinging does not occur.

Default: No change to the current value**System****Default:** none**:prty=** (optional)

Parity. This parameter specifies the parity for this terminal's serial port connection.

Range: none, even, odd**Default:** No change to the current value**System****Default:** even**:pu=** (optional)

Program update. This parameter specifies whether to display program update-related unsolicited messages in the scroll area.

Range: yes, no

yes—Receive all.

no—Receive none.

Default: If all is specified—current all value

If all is not specified—current pu value.

If type=emsalm is specified—yes

:sa= (optional)

Security administration. This parameter specifies whether to display security administration-related unsolicited messages in the scroll area.

Range: yes, no

yes—Receive all.

no—Receive none.

Default: If all is specified—current all value

If all is not specified—current sa value.

If type=emsalm is specified—yes

:sb= (optional)

Stop bit. This parameter specifies the number of stop bits used in communications with the terminal.

Range: 1-2**Default:** No change to the current value**System****Default:** 1

:seas= (optional)

This parameter specifies whether to display UAMs and UIMs assigned to the SEAS Maintenance output group in the scroll area.

Range: **yes, no**
 yes—Receive all.
 no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **seas** value.
 If **type=emsalm** is specified—**yes**

:slan= (optional)

This parameter specifies whether to display UAMs and UIMs assigned to the SLAN Maintenance output group in the scroll area.

Range: **yes, no**
 yes—Receive all.
 no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **slan** value.
 If **type=emsalm** is specified—**yes**

System

Default: **no**

:sys= (optional)

System. This parameter specifies whether to display system maintenance-related unsolicited messages in the scroll area.

Range: **yes, no**
 yes—Receive all.
 no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **sys** value.
 If **type=emsalm** is specified—**yes**

:tmout= (optional)

Maximum channel idle time. This parameter specifies the maximum amount of time in minutes that a login session can remain idle (that is, no user input) on a terminal before being automatically logged off. To disable idle time monitoring for a terminal, specify **tmout=0**.

Range: **0-99**
Default: No change to the current value

System

Default: **30** - minutes

:traf= (optional)

Traffic. This parameter specifies whether to display traffic-related unsolicited messages displayed in the scroll area.

Range: **yes, no**
 yes—Receive all.
 no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **traf** value
 If **type=emsalm** is specified—**yes**

System

Default: **no**

:type= (optional)

This parameter specifies the type of device being connected to this terminal.

Range: **vt320, ksr, printer, sccs, mgmt, telnet, emsalm, none, seas**
 The **type=emsalm** parameter value is valid for terminals 1-40.
 Only **telnet, emsalm, seas, and none** are valid values for terminals 17 - 40.

Default: Current value.

System

Default: **vt320** - for terminals 1-16
telnet - for terminals 17-40

:uimrd= (optional)

Unsolicited messages. This parameter specifies whether to display the unsolicited messages assigned to this group.

Range: **yes, no**
yes—Receive all.
no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **uimrd** value.
 If **type=emsalm** is specified—**yes**

System

Default: **no**

Example

```
chg-trm:trm=13:type=ksr:baud=9600:uimrd=yes
chg-trm:trm=1:link=yes:sys=yes:db=yes
chg-trm:trm=17:all=yes
chg-trm:trm=22:type=none
chg-trm:trm=10:link=yes:card=yes:clk=yes
chg-trm:trm=1:type=ksr:gtt=yes
chg-
trm:trm=2:appserv=no:appss=yes:card=yes:clk=no:dbg=no:gtt=yes:gws
=no:meas=yes:mon=no:mps=yes:seas=no:slan=yes

chg-trm:trm=17:logintmr=50

chg-trm:trm=17:pngtimeint=1000

chg-trm:trm=17:pngfailcnt=5
```

Dependencies

At least one optional parameter must be specified.

The system requires that at least two terminals be configured as security administration terminals. If only two security administration terminals are configured, the value of the **type** parameter cannot be changed to a value that would make the terminal unusable (**printer**, or **none**) because only one security administration terminal would remain.

The combined total line speed (baud rate) for all active terminal ports cannot exceed **168,000**. This value allows for 16 terminal to be configured at 9600 bps each.

If the **prty=none** parameter is specified, then the **type=vt320** parameter cannot be specified. A VT320 terminal does not support 7-bit data bytes and no parity. The number of data bits cannot be changed.

If the **prty=none** parameter is specified, then the **type=sccs** parameter cannot be specified.

For terminals 1 – 16, the **type=telnet** parameter cannot be specified.

For terminals 17 - 40, the value of the **type** parameter must be **telnet, seas, emsalm, or none**.

If the **type=telnet terminal** parameter is specified, then the **baud**, **prty**, **sb**, and **fc** parameters cannot be specified.

If the value of the **type** parameter is **telnet**, **seas**, or **emsalm**, and if the value of the **trm** parameter is 17-40, then an IPSM card must be equipped in the system. Parameters for these terminals cannot be changed unless an IPSM card has been added for the target terminal.

NOTE: If you install one IPSM card, telnet terminals 17-24 are available. If you install two IPSM cards, telnet terminal IDs 17-32 are available. If you install three IPSM cards, telnet terminal IDs 17-40 are available. If you remove an installed IPSM card, the eight terminal IDs that were assigned to that card are no longer available. For example, if you install three IPSM cards, and remove the second card that was installed, telnet terminal IDs 17-24 and 33-40 are available. To make the IDs consecutive again, you would need to remove and reinstall the third card that was previously installed. Then its available terminal IDs change from 33-40 to 25-32. You can enter the rtrv-trm command to display the available telnet terminal IDs.

The terminal port must be inhibited (see the **inh-trm** command) before the **type**, **baud**, **prty**, **sb** and **fc** parameters can be changed. The **all**, **traf**, **link**, **sa**, **db**, **sys**, **uimrd**, and **pu** parameters can be changed on any terminal, including the one in use, regardless of the port status (inhibited or allowed).

The port cannot be removed from service (**rmv-trm**) when the **type**, **baud**, **prty**, **sb**, and **fc** parameters are being changed.

The IP User Interface (Telnet) feature must be enabled and turned on before the **type=telnet** parameter (IDs 17-40) or the **type=emsalm** parameter (IDs 1-40) can be specified.

A valid value must be specified or the **baud** parameter. Baud rates 38400, 57600, and 115200 are only valid when the OAMHC is used.

If E5-MASP hardware is used, then a value of **hw** or **both** cannot be specified for the **fc** parameter.

The specified terminal must be inhibited before the **type=seas** parameter can be specified.

If the specified terminal is a SEAS Terminal, then the SEAS output group cannot be turned off.

If the SEAS Over IP feature is turned on, then an E5-IPSM or E5-ENET-B card must be provisioned at the location corresponding to the specified SEAS terminal.

The SEAS Over IP feature must be enabled before the **type=seas** parameter can be specified.

The **type=seas** parameter cannot be specified if:

- The value of the **trm** parameter is **1 - 16**.
- Specifying the parameter results in more than one SEAS terminal on an E5-IPSM or E5-ENET-B card.
- Specifying the parameter results in more than two SEAS terminals in the EAGLE 5 ISS.
- An E5-IPSM or E5-ENET-B card is not physically present in the corresponding location.
- An available (unconfigured) SEAS terminal does not exist in the SEASCFG table.

The IP User Interface feature must be turned on before the value of the **type** parameter can be **telnet**, **seas**, **emsalm**, or **none**.

The **type=telnet** parameter must be specified before the **logintmr** and **logouttmr** parameters can be specified.

If the value specified for the **type** parameter is **seas** or **none**, then the **pngtimeint** and **pngfailcnt** parameters cannot be specified.

The terminal must be in the Inhibited state before the **logintmr**, **logouttmr**, **pngtimeint**, and **pngfailcnt** parameters can be specified.

Notes

Refer to Appendix E, “Unsolicited Output Message Groups,” in the *EAGLE 5 ISS Maintenance Manual* for a list of unsolicited output messages that you might see for each output group.

This command cannot be entered when an upgrade is in progress.

If your terminal has the auto-wrap feature, you must disable the feature to use the terminal on the system.

To disable the informational message and temporary port lockout feature for a terminal, specify the **mxinv=0** parameter.

To prevent a terminal from being disabled, specify the **dural=0** parameter.

To make the lockout period for a terminal indefinite, specify the **dural=999999** parameter. When disabled, a terminal remains disabled until the port is inhibited (**inh-trm** command) and then allowed (**alw-trm** command).

Terminal idle time monitoring and auto-logout applies only if the terminal **type** is **vt320**, **ksr**, or **secs**. The **chg-trm** command can be entered with a **tmout** parameter value for other terminal types, but it has no effect.

Using the terminal type of **none** (**type=none**) conveys to the terminal processor that a particular port is not connected or is no longer in use. The terminal processor does not service output queues for a terminal port that is configured as **type=none**.

When the terminal type for a terminal is changed to **type=emsalm**, the value for all output group parameters is set to **yes**.

When the terminal type for a terminal is changed from **type=emsalm** to another type, the current value for all output groups is not changed. A command must be entered to change one or more output group values to another value.

NOTE: Though the output groups are set to yes, terminals of type emsalm do not display any reports or any UIMs except "UIM 1083 system alive".

The number of data bits cannot be changed; it is set to 7.

Software flow control (XON and XOFF pacing), involves sending control codes between the system and the connected device.

Hardware flow control (RTS and CTS pacing) uses the RTS and CTS lines of the RS-232 interface to pause and restart the flow of data between the system and the connected device.

Software flow control is recommended if the connected device is a printer. Both software and hardware flow control are highly recommended if the connected device is a modem.

To connect a modem, specify the **type=vt320** parameter.

The **all** parameter cannot be specified in the command with the other message status parameters (**traf**, **link**, **sa**, **db**, **sys**, or **pu**). If the **all** parameter and other message status parameters are specified together in the command, the terminal is assigned the other specified message status parameters and the **all** parameter is ignored.

If a SEAS terminal is being removed, then a warning that states “Invalidating the Terminal data in SEASCFG table” appears.

If the SEAS output group is turned off for a SEAS terminal, then a message "SEAS Output Group is SET for SEAS Terminal *trm number*" appears.

Output

```
chg-trm:trm=2:all=yes
  rlghncxa03w 04-05-07 11:11:28 EST EAGLE 31.5.0
  CHG-TRM: MASP A - COMPLTD

```

chg-ttmap**Change Translation Type Mapping**

Use this command to change a mapped SS7 message translation type (TT) for a given gateway linkset name. With this command you can change the identification of the type of allowed global title translation in the SS7 message before and after translation type mapping. For example, suppose you are mapping the translation type 001 (before TT mapping) to 238 (after TT mapping). You can use this command to change that mapping to 001 (before) to 254 (after).

Keyword: **chg-ttmap**

Related Commands: **dlt-ttmap**, **ent-ttmap**, **rtrv-ttmap**

Command Class: Database Administration

Parameters

:ett= (mandatory)

Translation type before mapping. The identification of the type of global title translation in the SS7 message *before* translation type mapping. This attribute is the decimal representation of the 1-octet binary field used by the SS7 protocol to identify the translation type.

Range: **0-255**

:io= (mandatory)

Incoming or outgoing. The system uses this parameter to indicate whether the translation type mapping data provisioned for the gateway linkset is for SS7 messages *received* or *sent* on the linkset.

Range: **i, o**
i—incoming
o—outgoing

:lsn= (mandatory)

Linkset name. The unique network identifier for the gateway linkset.

Range: *ayyyyyyyyy*
 1 alphabetic character followed by 9 alphanumeric characters

:mtt= (mandatory)

Mapped translation type. The identification of the type of global title translation in the SS7 message *after* translation type mapping. This attribute is the decimal representation of the 1-octet binary field used by the SS7 protocol to identify the translation type.

Range: **0-255**

Example

```
chg-ttmap:lsn=nc001:io=o:ett=128:mtt=55
```

Dependencies

The linkset must be defined.

Notes

None

Output

```

chg-ttmap:lsn=nc001:io=o:ett=128:mtt=55

rlghncxa03w 04-01-22 10:37:07 EST EAGLE 31.3.0
CHG-TTMAP: MASP A - COMPLTD

TTMAP table for nc001 is (2 of 64) 3% full

```

chg-ttr-msg**Change Triggerless TCAP Relay Message**

Use this command to revise a Triggerless TCAP Relay message.

Keyword: **chg-ttr-msg**

Related Commands: **rtrv-ttr-msg, tst-msg**

Command Class: Database Administration

Parameters

:msgn= (mandatory)

Message number. This parameter specifies the number of the TTR message.

Range: **1-10**

:active= (optional)

This parameter specifies whether the TTR message is sent to the network card for processing.

Range: **yes, no**

yes — The message is sent to the network card.

no — The message is not sent to the network card.

Default: **no**

:bcm= (optional)

Basic call state model. This parameter specifies the value for the *EventTypeBCSM* field of the TTR message.

Range: 2 digits

2 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.

Default: No change to the current value

:cdpadgts= (optional)

Called party address digits. This parameter specifies the SCCP CdPA digits for the IDP message.

Range: 1-15 digits

1 - 15 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.

Default: No change to the current value

:cdpagt= (optional)

Called party address global title. This parameter specifies the SCCP CdPA GT for the IDP message.

Range: **0-15**

Default: No change to the current value

:cdpagtnai= (optional)

Called party address global title nature of address indicator. This parameter specifies the SCCP CdPA GT NAI for the IDP message.

Range: **0-127**

Default: No change to the current value

:cdpndgts= (optional)

Called party number digits. This parameter specifies the TCAP CdPN digits for the IDP message.

- Range:** 1-32 digits
1 - 32 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
- Default:** No change to the current value
- :cdpnnai=** (optional)
Called Party Number Nature of Address Indicator. This parameter specifies the value for TCAP CdPN NAI value for the IDP message.
- Range:** **0-127**
- Default:** No change to the current value
- :cgpadtgs=** (optional)
Calling party address digits. This parameter specifies the SCCP CgPA digits for the IDP message.
- Range:** 1-15 digits
Range is 1 - 15 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
- Default:** No change to the current value
- :cgpagt=** (optional)
Calling party address global title. This parameter specifies the SCCP CgPA GT for the IDP message.
- Range:** **0-15**
- Default:** No change to the current value
- :cgpagnai=** (optional)
Calling party address global title nature of address indicator. This parameter specifies the SCCP CgPA GT NAI for the IDP message.
- Range:** **0-127**
- Default:** No change to the current value
- :cgpndgtgs=** (optional)
Calling party number digits. This parameter specifies the TCAP CgPN digits in the IDP message.
- Range:** 1-32 digits, **none**
1- 32 hexadecimal digits. Valid digits are **0-9, a-f , A-F**.
none—deletes the current digits
- Default:** No change to the current value
- :cgpnnai=** (optional)
Calling party number nature of address indicator. This parameter specifies the TCAP CgPN NAI in the IDP message.
- Range:** **0-127**
- Default:** No change to the current value
- :lacdgtgs=** (optional)
Location area code digits. This parameter specifies the area code if the value is not provided in the CdPN.
- Range:** 1-6 digits
1 - 6 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
- Default:** No change to the current value
- :reset=** (optional)
This parameter resets all of the parameters to their default values.
- Range:** **yes**
yes— Resets all message parameters to their default values
- Default:** No change to the current value
- :sk=** (optional)
Service key. This parameter specifies the service key for the IDP message.

Range: 8 digits
8 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
Default: No change to the current value

:tcapttype= (optional)

This parameter specifies whether the IDP message is Intelligent Network Application Protocol-based (INAP) or Camel Application Protocol-based (CAP).

Range: **inap, cap**
inap — INAP-based
cap — CAP-based

Default: No change to the current value

Example

```
chg-ttr-
msg:msgn=1:tcapttype=INAP:cdpnnai=4:cdpadgts=12457896abcd:cgpnnai=
4
chg-ttr-
msg:msgn=1:cdpnnai=2:cdpndgts=981123456:sk=00006b00:bcsn=02
```

Dependencies

The Prepaid IDP Query Relay feature must be enabled before this command can be entered.

If the **tcapttype** parameter is specified, then the **cdpnnai** and the **cgpnnai** parameters must be specified.

If the **reset** parameter is specified, then no other parameters can be specified.

At least one optional parameter must be specified.

Output

```
chg-ttr-
msg:msgn=1:tcapttype=CAP:cdpnnai=4:cdpndgts=987654321:cgpnnai=4
tekelecstp 08-05-05 15:58:08 EST EAGLE 39.0.0
CHG-TTR-MSG: MASP A - COMPLTD
;
```

chg-ttropts

Change TTR Options

Use this command to enter Triggerless TCAP Relay (TTR)-specific options in the database. This command updates the TTROPTS table.

NOTE: Values other than none that are entered for the dlma - dlmc parameters for the IDP Relay services (IDPRCDPN(X), IDPRCGPN) using this command will overwrite values entered for those parameters using the chg-npp-serv command.

Keyword: **chg-ttropts**
Related Commands: **rtrv-ttropts**
Command Class: Database Administration

Parameters

NOTE: The options for the on and off parameters are described in the Notes section.

:cddnnotfndrsp= (optional)

This parameter specifies the system response for an IDP message processed by the IDPR/TTR service when the Called Party Number (CdPN) is not found in the RTDB.

Range: **relay, connect, continue, release**
relay — relay the message

connect— send a CONNECT message
continue— send a CONTINUE message
release— send a RELEASECALL message

Default: **release**

:cddra= (optional)

This parameter specifies the destination routing address (DRA) used in the CONNECT message generated by the INPRTG Service Action based on the CdPN RTDB lookup.

Range: **rndn, rn, grn, rnasd, asdrn, rngrn, grnrn, ccrndn, rnasddn, asdrndn, ccrnasddn, ccasdrndn, asdrnccdn, rnasdccd, rngrndn, grnrndn, ccrngrndn, ccgrnrndn, grnrnccdn, rngnccdn, grndn, ccgrndn**

rndn— RN + DN

rn— RN

grn— GRN

rnasd— RN + ASD

asdrn— ASD + RN

rngrn— RN + GRN

grnrn— GRN + RN

ccrndn— CC + RN + DN

rnasddn— RN + ASD + DN

asdrndn— ASD + RN + DN

ccrnasddn— CC + RN + ASD + DN

ccasdrndn— CC + ASD + RN + DN

grnrndn— GRN + RN + DN

ccrngrndn— CC + RN + GRN + DN

ccgrnrndn— CC + GRN + RN + DN

grnrnccdn— GRN + RN + CC + DN

rngnccdn— RN + GRN + CC + DN

grndn— GRN + DN

ccgrndn— CC + GRN + DN

Default: **rndn**

:cddranai= (optional)

This parameter specifies the DRA nature of address indicator used in the CONNECT response generated by the INPRTG Service Action based on the CdPN RTDB lookup.

Range: **sub, unknown, natl, intl, ntwk**

Default: **natl**

:cddranp= (optional)

This parameter specifies the DRA numbering plan used in the CONNECT response generated by the INPRTG Service Action based on the CdPN RTDB lookup.

Range: **e164, x121, f69**

Default: **e164**

:cdnoentityrsp= (optional)

This parameter specifies the system response for an IDP message processed by the IDPR/TTR service when neither the RN nor SP entity is found in the CdPN RTDB.

Range: **relay, connect, continue, release**

relay— relay the message

connect— send a CONNECT message

continue— send a CONTINUE message

release— send a RELEASECALL message

Default: **continue**

:cdrelcause= (optional)

This parameter specifies the *cause* parameter value for the RELEASECALL message generated by the INPRTG Service Action based on the CdPN RTDB lookup.

Range: **1-127**

Default: **31** - (not defined)

:cdrnrsp= (optional)

This parameter specifies the system response for an IDP message processed by the IDPR/TTR service when the CdPN is associated with an RN entity.

Range: **relay, connect, continue, release**

relay — relay the message

connect — send a CONNECT message

continue — send a CONTINUE message

release — send a RELEASECALL message

Default: **connect**

:cdsprsp= (optional)

This parameter specifies the system response for an IDP message processed by the IDPR/TTR service when the CdPN is associated with an SP entity.

Range: **relay, connect, continue, release**

relay — relay the message

connect — send a CONNECT message

continue — send a CONTINUE message

release — send a RELEASECALL message

Default: **relay**

:cgdnnotfndrsp= (optional)

This parameter specifies the system response for an IDP message processed by the IDPR/TTR service when the Calling Party Number (CgPN) is not found in the RTDB.

Range: **relay, connect, continue, release**

relay — relay the message

connect — send a CONNECT message

continue — send a CONTINUE message

release — send a RELEASECALL message

Default: **release**

:cgdra= (optional)

This parameter specifies the DRA used in the CONNECT response generated by the INPRTG Service Action based on the CGPN RTDB lookup.

Range: **rndn, rn, grn, rnasd, asdrn, rngrn, grnrn, ccrndn, rnasddn, asdrndn, ccrnasddn, ccasdrndn, asdrnccdn, rnasdccd, rngrndn, grnrndn, ccrngrndn, ccgrnrndn, grnrnccdn, rngrnccdn, grndn, ccgrnrndn**

rndn — RN + DN

rn — RN

grn — GRN

rnasd — RN + ASD

asdrn — ASD + RN

rngrn — RN + GRN

grnrn — GRN + RN

ccrndn — CC + RN + DN

rnasddn — RN + ASD + DN

asdrndn — ASD + RN + DN

ccrnasddn — CC + RN + ASD + DN

ccasdrndn — CC + ASD + RN + DN
asdrnccdn — ASD + RN + CC + DN

grnrnccdn — GRN + RN + CC + DN
rngrnccdn — RN + GRN + CC + DN
grndn — GRN + DN
ccgrnrndn — CC + GRN + DN

Default: **rndn**

:cgdranai= (optional)

This option specifies the NAI option used in the CONNECT response generated by the INPRTG Service Action based on the CgPN lookup.

Range: **sub, unknown, natl, intl, ntwk**

Default: **natl**

:cgdranp= (optional)

This option specifies the DRA NP used in the CONNECT response generated by the INPRTG Service Action based on the CgPN lookup.

Range: **e164, x121, f69**

Default: **e164**

:cgnoentityrsp= (optional)

This parameter specifies the system response for an IDP message processed by the IDPR/TTR service when neither the RN nor SP entity is found in the CgPN RTDB.

Range: **relay, connect, continue, release**
relay — relay the message
connect — send a CONNECT message
continue — send a CONTINUE message
release — send a RELEASECALL message

Default: **continue**

:cgnptype = (optional)

CgPN database lookup type. This parameter specifies the entity type that is considered a success when used for RTDB lookup.

Range: **sp, rn, rnsp, anymatch, always, rnspdn**
sp — Service Provider
rn — Routing Number
rnsp — **rn** or **sp**
anymatch — **rn, sp**, or no match with any entity
always — Lookup is always considered successful
rnspdn — **rn, sp**, or **dn**

If the **cgnptype=anymatch** parameter is specified, then the value is also used as the RN for the outgoing CgPN.

Default: **rnsp**

:cgpaccck= (optional)

CgPA country code check. This parameter specifies whether a DEFCC check is performed on the incoming CgPA.

Range: **always, nonintl, off**
always — The DEFCC check is always performed.
nonintl — The DEFCC check is performed if the CdPN NAI is not 'International'.

- off** — The DEFCC check is not performed.
- Default:** **nonintl**
- :cgpnskrtg=** (optional)
This parameter specifies whether SK routing occurs if IDP A-Party routing fails.
- Range:** **no, yes**
no — SK routing does not execute if IDP A-Party Routing fails.
yes — SK routing executes if IDP A-Party Routing fails.
- Default:** No change to the current value
- System**
- Default:** **no**
- :cgrelcause=** (optional)
This parameter specifies the *cause* parameter value in the RELEASECALL message generated by an INPRTG Service Action based on the CgPN RTDB lookup.
- Range:** **1-127**
- Default:** **31** - (not defined)
- :cgrnrsp=** (optional)
This parameter specifies the system response for an IDP message processed by the IDPR/TTR service when the CgPN is associated with an RN entity.
- Range:** **relay, connect, continue, release**
relay — relay the message
connect — send a CONNECT message
continue — send a CONTINUE message
release — send a RELEASECALL message
- Default:** **connect**
- :cgsnai=** (optional)
Calling party number nature of address indicator. This parameter specifies the CgPN NAI that is used during number conditioning.
- Range:** **incoming, intl, natl, unkn**
incoming — The incoming CgPN NAI is used.
intl — The CgPN NAI is set to 'International' (4).
natl — The CgPN NAI is set to 'National' (3).
unkn — The CgPN NAI is set to 'Unknown' (0).
A value of **incoming** must be specified before the **intl, natl, nai1, nai2, nai3,** and **unkn** parameters in the **chg-npp-serv** command can be changed to non-default values for the the IDPRCGPN service.
- Default:** **incoming**
- :cgsprsp=** (optional)
This parameter specifies the system response sent for an IDP message processed by the IDPR/TTR service when the CgPN is associated with an SP entity.
- Range:** **relay, connect, continue, release**
relay — relay the message
connect — send a CONNECT message
continue — send a CONTINUE message
release — send a RELEASECALL message
- Default:** **relay**
- :dfiltrn=** (optional)
Default routing number. This parameter specifies the default RN that is used when a value of **sp** or **rns** is specified for the **nptype** parameter, and the CdPN RTDB lookup returns entity type SP.
- Range:** **1-15 digits, none**
1-15 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.

- Default:** **none**—a default RN is not used
Default: **none**
- :dlma=** (optional)
 Delimiter A. This parameter specifies the first delimiter that is used to format the outgoing TCAP dialed number.
Range: 1-16 digits, **none**
 1-16 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
Default: **none**
- :dlmb=** (optional)
 Delimiter B. This parameter specifies the second delimiter that is used to format the outgoing TCAP dialed number.
Range: 1-16 digits, **none**
 1-16 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
- :dlmc=** (optional)
 Delimiter C. This parameter specifies the third delimiter that is used to format the outgoing TCAP DN.
Range: 1-16 digits, **none**
 1-16 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.
- :drafmt=** (optional)
 DRA digit format. This parameter specifies the format of the DRA digits.
Range: **grn, grndn, dngrn, ccgrndn, grnccdn**
grn — The format is GRN.
grndn — The format is GRN+DN.
dngrn — The format is DN+GRN.
ccgrndn — The format is CC+GRN+DN.
grnccdn — The format is GRN+CC+DN.
Default: No change to the current value
System
Default: **grn**
- :dranai=** (optional)
 DRA nature of address indicator. This parameter specifies the DRA NAI that is used during number conditioning.
Range: **1-127**
Default: No change to the current value
System
Default: **3 - NATL**
- :map=** (optional)
 Mapping direction. This parameter specifies the mapping direction between the Type of Number (TON) and the Nature Of Address Indicator (NAI)
Range: **nai2ton, ton2nai**
nai2ton — NAI mapping to TON
ton2nai — TON mapping to NAI
Default: See the *Notes* section.
- :nai=** (optional)
 Nature of Address Indicator. This parameter specifies the NAI used in mapping.
Range: **0-127**
Default: See the *Notes* section.

:nptype= (optional)

Entity type for CdPN RTDB lookup. This parameter specifies the entity type that is considered a success when used for RTDB lookup.

Range: **sp, rn, rnsp, anymatch, always, rnspd**

sp — Service provider

rn — Routing number

rnsp — **rn** or **sp**

anymatch — **rn, sp**, or no match with any entity

always — Lookup is always considered successful

rnspd — **rn, sp**, or **dn**

If the **nptype=anymatch** parameter is specified, then the value is also used as the RN for the outgoing CdPN.

Default: **rnsp** - Use RN or SP as entity type for RTDB lookup

:off= (optional)

This parameter turns off the specified options. Up to 8 comma-separated unique options can be specified.

Range: **cdcnp, cgcnp**

:on= (optional)

This parameter turns on the specified options. Up to 8 comma-separated unique options can be specified.

Range: **cdcnp, cgcnp**

:rnspfill= (optional)

This parameter specifies whether the RN and SP entities are set to the value of the RN or SP digits from the RTDB when certain conditions are met.

Range: **off, on**

off — If the **nptype** parameter has a value of **rnsp, anymatch**, or **always**, and the **dfiltrn=none** parameter is specified, then the RN entity is NOT set to the value of the RN digits from the RTDB. If the **nptype** parameter has a value of **rnsp, anymatch**, or **always**, then the SP entity is NOT set to the value of the RN digits from the RTDB.

on — If the **nptype** parameter has a value of **rnsp, any**, or **all**, and the **dfiltrn** parameter has a value of **none**, then the RN entity is set to the value of the SP digits from the RTDB. If the **nptype** parameter has a value of **rnsp, anymatch**, or **always**, and the **spfill=on** parameter is specified, then the SP entity is set to the value of the RN digits from the RTDB.

Default: No change to the current value

System

Default: **off**

:snai= (optional)

CdPN nature of address indicator. This parameter specifies the CdPN NAI that is used during number conditioning.

Range: **incoming, intl, natl, unkn**

incoming — The incoming CdPN NAI is used.

intl — A CdPN NAI of 'International' (4) is used.

natl — A CdPN NAI of 'National' (3) is used.

unkn — A CdPN NAI of 'Unknown' (0) is used.

A value of **incoming** must be specified before the **intl, natl, nai1, nai2, nai3**, and **unkn** parameters in the **chg-npp-serv** command can be changed to non-default values for the IDPRCDPN(X) service.

Default: **incoming**

:spfill= (optional)

This parameter specifies whether the SP entity type is populated if the value specified for the **dfltrn** or **grn** parameter is used for NPP processing.

Range: **off, on**
 off— do not populate the SP entity type
 on— populate the SP entity type

Default: No change to the current value

System

Default: **off**

:sporttype= (optional)

Service Portability type. This parameter specifies whether Service Portability is performed for the associated feature.

The S-Port feature must be turned on before any change to the parameter will impact the associated feature. If Service Portability is performed, then the Service Portability prefix (RTDB 'GRN' entity id) is applied.

Range: **gsm, is41, all, none**
 gsm, none— apply Service Portability prefix for own-network GSM subscribers
 is41, none— apply Service Portability prefix for own-network IS41 subscribers
 all, none— apply Service Portability prefix for all own-network (IS41 and GSM) subscribers
 none—Service Portability is not performed for the feature.

Default: No change to the current value

System

Default: **none**

:ton= (optional)

Type of Number. This parameter specifies the Type of Number used in mapping.

Range: **0-7**

Default: See the *Notes* section.

Example

```
chg-ttropts:nptype=always
chg-ttropts:snai=intl
chg-ttropts:cgnptype=sp
chg-ttropts:cgsnai=natl
chg-ttropts:dlma=1234567890
chg-ttropts:dlmb=1234567890123456
chg-ttropts:dlmc=1234567890abcdef
chg-ttropts:cgpaccck=always
chg-ttropts:dfltrn=123456789012345
chg-ttropts:cddra=rn:cdrelcause=10:cgdranp=e164:cdnrsp=continue
chg-ttropts:cddra=grndn:on=cdcnp:off=cgcnp
chg-ttropts:nai=12:ton=7:map=nai2ton
```

Dependencies

At least one optional parameter must be specified.

The Prepaid IDP Query Relay feature must be enabled before this command can be entered.

The IDP A-Party Routing feature and the IDP SK Routing feature must be enabled before the **cgpskrtg** parameter can be specified.

If the new or existing value specified for the **drafrmt** parameter contains a country code (e.g., **ccgrndn**), then only a value of **4** can be specified for the **dranai** parameter. If the **dranai** parameter has a new or existing value that is not equal to **4**, then the value that is specified for the **drafrmt** parameter cannot contain a country code.

The S-Port feature must be enabled before the **sporttype** parameter can be specified.

The **nai**, **ton**, and **map** parameters must be specified together in the command.

Notes

Definitions for the on/off options

- **cdcnp**—Specifies whether the *CutAndPaste* parameter is included in the CONNECT message generated by the INPRTG Service Action based on the CdPN RTDB lookup. The value for the *CutAndPaste* parameter is the length of the incoming DN in the IDP query if the DRA formatting option has a DN. If the option does not have a DN, the value is **0**. The option has a default of OFF.
- **cgcnp**—Specifies whether the *CutAndPaste* parameter is included in the CONNECT message generated by the INPRTG Service Action based on the CgPN RTDB lookup. The value for the *CutAndPaste* parameter is the length of the incoming DN in the IDP query if the DRA formatting option has a DN. If the option does not have a DN, the value is **0**. The option has a default of OFF.

IDPR TON Mapping Default Values

If the **map**, **nai**, and **ton** parameters are not specified, then the TON and NAI values are associated as follows:

Table 5-17.
TON2NAI Mapping Default Values

TON	NAI	
1	4	INTL
2	3	NATL
0	2	UNKN
All other values	2	-

Table 5-18.
NAI2TON Mapping Default Values

NAI	TON	
4	1	INTL
3	2	NATL
2	0	UNKN
All other values	0	-

Output

```

chg-ttropts:nptype=sp

chg-uaps

Change UA Parameter Set

Use this command to change the UA parameter set.

Keyword: chg-uaps

Related Commands: rtrv-uaps

Command Class: Database Administration

Parameters

:set= (mandatory)

UA parameter set to be changed.

Range: 1-9

Default: No change to the current value

:parm= (optional)

Parameter number.

Range: 1-10

- 1—ASP SNM Options
- 2—ASP/AS Notification Options
- 3—UA Serviceability Options
- 4-10—Unused

Default: No change to the current value

:pvalue= (optional)

If the **parm** parameter is specified, then the **pvalue** parameter specifies the numerical value that the **parm** parameter will be set to. Each parameter value is 32 bits (decimal 4294967295); not all 32 bits are used for each parameter. Only the values of the used bits are evaluated to determine the parameter value.

If the default setting for one bit is ON and you want to turn ON another bit in addition, specify the value that turns both bits ON. To turn OFF a bit that is ON and leave other bits ON, specify the value

that turns ON just the bits that you want to be on. See the Notes section for this command for an explanation of the meanings of the bit settings.

Range: 0-4294967295

Enter a valid decimal or hexadecimal value shown in Table 5-19 for the **pvalue** parameter to be used for the specified **parm** parameter.

Table 5-19. Valid and Default UAPS Parameter Values

Parameter (parm)	To Turn On Only Bit(s)	Decimal pvalue	Hexadecimal pvalue	System Default
1. ASP SNM Options Bit 0 = Broadcast Bit 1 = Response Method Bit 6 = Broadcast Congestion Status Change Bits 2-5 and 7-31 = Unused	0	1	h'1	
	1	2	h'2	
	6	64	h'40	Off
	0, 1	3	h'3	On
	0, 6	65	h'41	
	1, 6	66	h'42	
	0, 1, 6	67	h'43	
2. ASP/AS Notification Options Bit 0 = ASP ACTIVE Notifications Bit 1 = ASP INACTIVE Notifications Bit 2 = ASP AS State Query Bits 3-31 = Unused	0	1	h'1	
	1	2	h'2	
	2	4	h'4	
	0, 1	3	h'3	
	0, 2	5	h'5	
	1, 2	6	h'6	
	0, 1, 2	7	h'7	Off
3. UA Serviceability Options Bit 0 = UA Heartbeats Bit 1 = UA Graceful Shutdown Bits 2-31 = Unused	0	1	h'1	Off
	1	2	h'2	Off
	0,1	3	h'3	Off
4. SCTP Payload Protocol Indicator Option Bit 0 = Payload Protocol Indicator Bits 1-31 = Unused	0	1	h'1	Off

Default: No change to the current value

:srcset= (optional)

When specified, this source UAPS will be copied into the specified UAPS (**set**).

Range: 1-10

Default: Empty

:timer= (optional)

Timer number within the UA parameter set.

Range: 1-10

1—Unused

2—False IP Connection Congestion Timer

3—UA Heartbeat Period Timer

4—UA Heartbeat Received Timer

5-10—Unused

Default: No change to the current value

:tvalue= (optional)

The value given to a timer. Each timer value is 32 bits (decimal 4294967295).

Range: 0-60000

Timer 2—0-30000 milliseconds

Timer 3—100-60000 milliseconds

Timer 4—100-10000 milliseconds

If the value specified is greater than the maximum range of the timer, then the maximum value of the timer is used.

Default: No change to the current value

System

Default: Timer 2 - 3000 milliseconds

Timer 3 - 10000 milliseconds

Timer 4 - 5000 milliseconds

Example

The following example copies UA parameter set 1 into UA parameter set 2.

```
chg-uaps: set=2: srcset=1
```

The following example sets the Timer 2 value to 30 milliseconds.

```
chg-uaps: set=1: timer=2: tvalue=30
```

The following example sets the UA parameter set 2 value to hexadecimal 7, which turns on bits 0, 1, and 2.

```
chg-uaps: set=1: parm=2: pvalue=h' 7
```

The following example sets the Timer 2 value to 30 milliseconds, and sets the value for UA parameter set 1 to decimal 64, which turns OFF bits 0 and 1 and turns ON only bit 6.

```
chg-uaps: set=2: timer=2: tvalue=30: parm=1: pvalue=64
```

Dependencies

The **srcset** and **set** parameter values cannot be the same.

At least one of the **timer**, **parm**, and **srcset** optional parameters must be entered.

If the **srcset** parameter is specified, no other optional parameters can be entered in the command.

If the **parm** parameter is specified, the **pvalue** parameter must be specified.

If the **timer** parameter is specified, the **tvalue** parameter must be specified.

Notes

There are 10 UA parameter sets. Each UA parameter set has 10 timers and 10 optional bit-mapped parameters. The bit-mapped parameter values control SNM and extended UA notification message behavior.

Timer 2 is the False IP Connection Congestion Timer, which controls the maximum amount of time (in milliseconds) that an association is allowed to remain congested before failing due to false connection congestion. This timer value is limited to 0-30,000 milliseconds by the IPGWx application. The default value is 3000 milliseconds. This timer is not supported on the IPSG application.

Timer 3 is the UA Heartbeat Period Timer, which controls the time (in milliseconds) between sending of BEAT messages by the NE. This timer value is limited to 100-60,000 milliseconds by the IPSG and IPGWx applications. The default value is 10,000 milliseconds.

Timer 4 is the UA Heartbeat Received Timer, which controls the timeout period for response BEAT ACK messages by the NE. This timer value is limited to 100-10,000 milliseconds by the IPSG and IPGWx applications. The default value is 5000 milliseconds.

The bit-mapped parameters contain the following flags, which are set by using the **pvalue** parameter to turn the bits on or off in each bit map:

Broadcast—Controls broadcast phase SNM TFPs, TFRs and TFAs sent when a destination's status changes. If this flag is on (set to 1), SNM TFPs, TFRs, and TFAs will be broadcast to all associations and sockets assigned to routing keys associated with the destination's network and group code. The default is to enable all broadcast phase messages.

Response Method—Sending a SNM TFC/UPU as a reply to a message received on an association or a socket for an unavailable destination. If this bit is on (set to 1), the SNM response message is sent. The default is to allow the response to be sent.

Broadcast Congestion Status Change—Controls sending unsolicited congestion status changes. If this flag is on (set to 1) for an ASP, unsolicited congestion status messages are sent by the ASP when a destination's congestion status changes. This flag is applicable only if **ipgwabate** has been turned on with the **chg-sg-opts** command. The default is do not generate unsolicited congestion status changes.

ASP ACTIVE Notifications—Controls sending ASP-Active notifications. If this flag is on (set to 1), the Secure Gateway will, when an ASP transitions to Active, send a Notify message to all inactive and active ASPs in the AS of status type "Other" and a newly defined status ID of "ASP Activation". The ASP Activation notification message will include the ASP ID of the ASP that activated, and is transmitted only if the ASP ID is present. This notification is an extension to RFC3332 and not implemented for M3UA Version 8 adapters. The default is do not send ASP Active Notifications.

ASP INACTIVE Notifications—Controls sending ASP-Inactive notifications. If this flag is on (set to 1), the Secure Gateway will, when an ASP transitions to Inactive, send a Notify message to all inactive and active ASPs in the AS of status type "Other" and a newly defined status ID of "ASP Inactivation". The ASP Inactivation notification message will include the ASP ID of the ASP that inactivated and is transmitted only if the ASP ID is present. This notification is an extension to RFC3332 and not implemented for M3UA Version 8 adapters. The default is do not send ASP Inactive Notifications.

ASP AS State Query—Controls sending ASP/AS State Notifications on request by ASP. If this flag is on (set to 1), the Secure Gateway will respond with ASP and AS state notifications if 1) the remote ASP sends ASP-UP or ASP-INACTIVE while the local ASP is in the ASP-INACTIVE state, or 2) the remote ASP sends ASP-ACTIVE while the local ASP is in the ASP-ACTIVE state. The default is do not send state notifications.

UA Heartbeats—Controls sending UA Heartbeats on request by a connection. If this flag is on (set to 1), Heartbeat messages are transmitted in the ASP-DOWN, ASP-ACTIVE and ASP-INACTIVE States on connections from the Secure Gateway to the far end.

UA Graceful Shutdown—Controls whether an association should be shutdown gracefully or not. If this flag is on (set to 1), then a graceful shutdown will occur when OPEN=NO is executed on the server side. Otherwise, the association will abort when OPEN=NO is executed.

SCTP Payload Protocol Indicator byte order option—Indicates whether the SCTP Payload Protocol Indicator (PPI) in received/transmitted messages is in big endian or little endian byte format. If this flag is on (set to 1), then the PPI in received/transmitted messages is little endian. Otherwise, the PPI is in big endian byte format. This flag is implemented only on IPSG M2PA associations; all other association types ignore the flag.

Output

```
chg-uaps: set=2: srcset=1
rlghncxa03w 02-03-07 11:11:28 EST EAGLE 30.0.0
CHG-UAPS: MASP A - COMPLTD
;
```

chg-user

Change User

Use this command to change user access to commands, change user ID's, and change passwords.

Keyword: chg-user

Related Commands: act-user, chg-pid, dact-user, dlt-user, ent-user, login, logout, rept-stat-user, rtrv-secu-user, rtrv-user

Command Class: Security Administration

Parameters

:uid= (mandatory)

User ID

Range: aaaaaaaaaaaaaa

1 alphabetic character followed by up to 15 alphanumeric characters

:all= (optional)

Specifies whether or not the user ID is assigned all non-configurable command classes (LINK, SA, SYS, PU, DB, DBG, LNP).

Range: yes, no

Default: No change to the current value

:cc1= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: ayy

Specify the parameter value in the format *ayy -no* or *ayy -yes*.

ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

-no—Indicates that the command class is not allowed.

-yes—Indicates that the command class is allowed.

:cc2= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*
Specify the parameter value in the format *ayy -no* or *ayy -yes*.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:cc3= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*
Specify the parameter value in the format *ayy -no* or *ayy -yes*.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:cc4= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*
Specify the parameter value in the format *ayy -no* or *ayy -yes*.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:cc5= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*
Specify the parameter value in the format *ayy -no* or *ayy -yes*.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:cc6= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*
Specify the parameter value in the format *ayy -no* or *ayy -yes*.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:cc7= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*
Specify the parameter value in the format *ayy -no* or *ayy -yes*.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:cc8= (optional)
Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*
Specify the parameter value in the format *ayy -no* or *ayy -yes*.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:db= (optional)
Access to all commands in command class Database Administration.

Range: **yes, no**
Default: No change to the current value

:dbg= (optional)
Access to all commands in command class Debug.

Range: **yes, no**
Default: No change to the current value

:link= (optional)
Access to all commands in command class Link Maintenance.

Range: **yes, no**
Default: No change to the current value

:nuid= (optional)
New user ID

Range: *aaaaaaaaaaaaaaaa*
1 alphabetic character followed by up to 15 alphanumeric characters
Default: No change to the current value

:page= (optional)
The maximum age of the password, in days. The STP automatically prompts the user for a new password at login if the user's password is older than the value specified for the **page** parameter.

Range: **0-999**
Default: No change to the current value

:pid= (optional)
Password ID. Required only if changing the password of a user.

Range: **yes, no**
Default: No change to the current value

:pu= (optional)
Access to all commands in command class Program Update.

Range: **yes, no**
Default: No change to the current value

:revoke= (optional)

Revoke the user ID. The system rejects login attempts for a revoked user ID.

Range: **yes, no**

Default: No change to the current value

:rstlsl= (optional)

Reset the user ID. Use this command to reset the last successful login date, for this user ID, to the current date. If the user ID has been prevented login for non-use, use the **rstlsl=yes** parameter to allow the user ID access again.

Range: **yes, no**

Default: No change to the current value

:sa= (optional)

Access to all commands in command class Security Administration.

Range: **yes, no**

Default: No change to the current value

:sys= (optional)

Access to all commands in command class System Maintenance.

Range: **yes, no**

Default: No change to the current value

:uout= (optional)

User ID aging interval. The number of successive days a user ID can go unused (that is, no successful login) before the system denies login of that user ID.

Range: **0-999**

Default: The value specified for the **uout** parameter on the **chg-secu-dflt** command

Example

```
chg-user:uid=john:nuid=johnmayer
```

```
chg-user:uid=john:nuid=john*mayer
```

```
chg-user:uid=john:db=yes
```

```
chg-user:uid=user123:cc1=dab-no:cc2=krb=yes
```

Dependencies

Passwords cannot be created or modified from a telnet terminal (terminal IDs 17-40) unless the OA&M IP Security Enhancements feature is turned on.

Changes to a user ID cannot be made while that user is logged on the system.

The **revoke=yes** parameter cannot be specified for a user ID with system administration authorization.

The Command Class Management feature must be enabled before a configurable command class name can be specified in the **cc1 - cc8** parameters.

The values specified in the **cc1 - cc8** parameters must be valid default (**u01-U32**) or provisioned configurable command class names.

Notes

When the **pid=yes** parameter is specified, the system issues a separate prompt for this password and disables character echo at the terminal so that the entered password is not displayed on the screen. After the password has been entered, the system issues a second prompt, and the password must be entered again. This feature ensures that no typing mistakes were made on the first entry. The password must adhere to all password provisioning rules as established by the **chg-secu-dflt** command. These rules are displayed on the screen when the password prompt is presented.

The current password is not required when assigning a new password.

Use the following rules for changing passwords:

- A new password cannot contain more than 12 characters.
- A new password must contain at least the number of characters that is specified in the **minlen** parameter of the **chg-secu-dflt** command.
- A new password must contain at least the number of alphabetic (**alpha** parameter), numeric (**num** parameter), and punctuation (**punc** parameter) characters that is specified in the **chg-secu-dflt** command.

A new password cannot contain the associated user ID.

As a default, the command class Basic is assigned to all users. If no other command class is assigned, the user still has access to commands in the Basic class.

Up to 8 configurable command class name parameters can be specified in one command. Additional commands can be entered to assign user access for more than 8 names. To assign user access for all 32 available configurable command class names, you could enter four commands with 8 names specified in each command.

Output

```
chg-user:uid=john:nuid=johnmayer
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
CHG-USER: MASP A - COMPLTD
;
```

chg-vflx-cd

Change V-Flex Call Decision Entry

Use this command to revise the call decision criteria. This command updates the Call Decision table.

NOTE: The V-Flex feature must be enabled before this command can be entered.

Keyword: **chg-vflx-cd**

Related Commands: **dlt-vflx-cd**, **ent-vflx-cd**, **rtrv-vflx-cd**

Command Class: Database Administration

Parameters

:cdn= (mandatory)

Call decision name. This parameter specifies the name of an entry in the Call Decision table.

Range: *ayyy*

1 alphabetic character followed by 3 alphanumeric characters.

:ncdn= (optional)

New call decision name. This parameter specifies a new name for an entry in the Call Decision table.

Range: *ayyy*

1 alphabetic character followed by 3 alphanumeric characters

Default: No change to the current value

:nrnidx= (optional)

New routing number index. This parameter specifies a new routing number index that is associated with a call decision entry.

Range: **0-9**

Default: No change to the current value

:nvmDIG= (optional)

New voice mail number or voice mail prefix digits. This parameter specifies a new voice mail number or voice mail digits that is associated with a call decision entry.

Range: 1-15 digits

Valid digits **0-9, A-F, a-f**

Default: No change to the current value

Example

The following command specifies a new routing number index.

```
chg-vflx-cd:cdn=cdn1:nrnidx=7
```

The following command specifies a new call decision entry name and new routing number index.

```
chg-vflx-cd:cdn=cdn1:ncdn=cdn3:nrnidx=3
```

The following command specifies a new call decision entry name.

```
chg-vflx-cd:cdn=cdn3:ncdn=cdn5
```

The following command specifies a new voice mail number or voice mail prefix digits.

```
chg-vflx-cd:cdn=cdn1:nvmDIG=123456
```

Dependencies

The value specified for the **cdn** parameter cannot be a reserved word, such as **none**.

At least one parameter value must be different from the values provisioned for the table entry.

The value specified for the **cdn** parameter must already exist in the Call Decision table.

The **ncdn**, **nrnidx**, or **nvmDIG** parameter must be specified.

The V-Flex feature must be enabled before this command can be entered.

The value specified for the **ncdn** parameter cannot already exist in the Call Decision table.

The value specified for the **nvmDIG** parameter cannot already exist in the Call Decision table with the same **dnstat**, **rdi**, and **bcap** values.

The value specified for the **nvmDIG** parameter cannot differ from a value that already exists in the Call Decision table by only the value of the **dnstat** parameter. The values specified for **rdi** and **bcap** parameters must differ as well.

Output

```
chg-vflx-cd:cdn=cdn1:ncdn=cdn3:nrnidx=3
rlghncxa03w 08-05-07 11:11:28 EST EAGLE 39.0.0
CHG-VFLX-CD: MASP A - COMPLTD
;
```

chg-vflx-opts

Change V-Flex Options

Use this command to provision the data that is used to condition the DN in an incoming MSU. This command updates the VFLXOPTS table.

NOTE: The V-Flex feature must be enabled before this command can be entered.

Keyword: **chg-vflx-opts**

Related Commands: **rtrv-vflx-opts**

Command Class: Database Administration

Parameters

NOTE: The nature of address indicator parameters (dranaiv or drnai) can be specified using a mnemonic or an explicit value. Either the mnemonic or the explicit value can be specified:

however, both values cannot be specified at the same time for the same parameter. Table A-5 shows the mapping between the `dranaiv` and the `drnai` parameter values.

NOTE: The numbering plan parameters (`dranpv` or `dranp`) can be specified using a mnemonic or an explicit value. Either the mnemonic or the explicit value can be specified; however, both values cannot be specified at the same time for the same parameter. Table A-6 shows the mapping between the `dranaiv` and the `drnai` parameter values.

:dra= (optional)

Destination routing address. This parameter specifies the destination routing address in the "CONNECT" response.

Range: **rn, rndn, ccrndn**
rn — Routing number
rndn — RN + DN
ccrndn — CC + RN + DN
Default: No change to current value.
System
Default: **rn**

:dranai= (optional)

Nature of address indicator. This parameter specifies the nature of address indicator for the destination routing address.

Range: **sub, unknown, natl, intl, ntwk**
Default: Current value

:dranaiv= (optional)

This parameter specifies the nature of address indicator value for the destination routing address.

Range: **0-127**

:dranp= (optional)

This parameter specifies the numbering plan for the destination routing address.

Range: **e164, x121, f69**
Default: No change to the current value

:dranpv= (optional)

This parameter specifies the numbering plan value for the destination routing address.

Range: **0-7**
Default: No change to the current value

:nequeryonly= (optional)

This parameter specifies whether the Call Decision table is searched after RTDB lookup.

Range: **off, on**
off — The table is not searched.
on — The table is searched.
Default: No change to the current value.

:netype= (optional)

This parameter specifies the network entity type that is used for RTDB lookup.

The **nequeryonly=on** parameter must be specified before this parameter can be specified.

Range: **vmsid, sprn, grn**
vmsid — voice mail server ID
sprn — signaling point routing number
grn — generic routing number
Default: No change to the current value.
System
Default: **vmsid**

Example

The following command specifies a new numbering plan and nature of address indicator.

```
chg-vflx-opts:dranai=sub:dranp=e164
```

The following command searches the Call Decision and VMSID tables and uses the vmsid network entity before RTDB lookup.

```
chg-vflx-opts:nequeryonly=on:netype=vmsid
```

The following command specifies a new destination routing address.

```
chg-vflx-opts:dra=rn
```

Dependencies

At least one optional parameter must be specified.

The **dranp** and **dranpv** parameters cannot be specified together in the command.

The **dranai** and **dranaiv** parameters cannot be specified together in the command.

The V-Flex feature must be enabled before this command can be entered.

The **nequeryonly=on** parameter must be specified before the **netype** parameter can be specified.

Output

```
chg-vflx-opts:dra=rn:dranp=e164:dranai=intl
tekelecstp 08-05-11 11:34:04 EST EAGLE 39.0.0
CHG-VFLX-OPTS: MASP A - COMPLTD
;
```

chg-vflx-rn**Change Voice Mail Routing number**

Use this command to revise the voice mail routing numbers. This command updates the Routing Number table.

NOTE: The V-Flex feature must be enabled before this command can be entered.

Keyword: **chg-vflx-rn**

Related Commands: **dlt-vflx-rn, ent-vflx-rn, rtrv-vflx-rn**

Command Class: Database Administration

Parameters

:rname= (mandatory)

Routing number name. This parameter specifies the name associated with a voice mail routing number.

Range: *ayyyyyyy*
1 alphabetic character followed by 7 alphanumeric characters.

:nrn= (optional)

New routing number. This parameter specifies a new voice mail routing number.

Range: 1-15 digits
Valid digits **0-9, A-F, a-f**

Default: No change to the current value

:nrname= (optional)

New routing number name. This parameter specifies the new name associated with a voice mail routing number.

Range: *ayyyyyyy*
1 alphabetic character followed by 7 alphanumeric characters.

Default: No change to the current value

Example

The following command changes the name of the routing number.

```
chg-vflx-rn:rnname=rn01:nrname=rn04
```

The following command changes the routing number digits for a specified routing number name.

```
chg-vflx-rn:rnname=rn01:nrn=122345BC8
```

The following command changes the routing number digits and the routing number name.

```
chg-vflx-rn:rnname=rn01:nrn=1223EAB68:nrname=rn03
```

Dependencies

The value specified for the **rnname** parameter must already exist in the Routing Number table.

The value specified for the **nrn** parameter cannot already exist in the Routing Number table.

The V-Flex feature must be enabled before this command can be entered.

The value specified for the **nrname** parameter cannot already exist in the Routing Number table.

The **nrn** or **nrname** parameter must be specified in the command.

The value specified for the **nrname** parameter cannot be a reserved word, such as **none**.

At least one parameter value must be different from the values provisioned for the table entry.

Output

```
chg-vflx-rn:rnname=rn01:nrn=122345CE8:nrname=rn02
rlghncxa03w 08-05-07 11:43:04 EST EAGLE 39.0.0
CHG-VFLX-RN: MASP A - COMPLTD
;
```

chg-vflx-vmsid

Change Voice Mail Service ID Entry

Use this command to revise the routing numbers that are associated with a VMS ID. This command updates the VMSID table.

NOTE: The V-Flex feature must be enabled before this command can be entered.

Keyword: **chg-vflx-vmsid**

Related Commands: **dlt-vflx-vmsid, ent-vflx-vmsid, rtrv-vflx-vmsid**

Command Class: Database Administration

Parameters

:id= (mandatory)

This parameter specifies the identification of the voice mail server.

Range: 1-15 digits, **dflt**

Valid digits are **0-9, A-F, a-f**.

dflt—default set of routing numbers that is used when a query is received with an invalid MSISDN or an MSISDN that is not found in the RTDB.

:nidx0= (optional)

This parameter specifies a new routing number name for VMRN index 0.

Range: *ayyyyyyy*, **none**

1 alphabetic character followed by up to 7 alphanumeric characters

none—deletes the routing number name associated with an index

Default: No change to the current value

:nidx1= (optional)

This parameter specifies a new routing number name for VMRN index 1.

Range: *ayyyyyyy*, **none**
1 alphabetic character followed by up to 7 alphanumeric characters
none—deletes the routing number name associated with an index

Default: No change to the current value

:nidx2= (optional)

This parameter specifies a new routing number name for VMRN index 2.

Range: *ayyyyyyy*, **none**
1 alphabetic character followed by up to 7 alphanumeric characters
none—deletes the routing number name associated with an index

Default: No change to the current value

:nidx3= (optional)

This parameter specifies a new routing number name for VMRN index 3.

Range: *ayyyyyyy*, **none**
1 alphabetic character followed by up to 7 alphanumeric characters
none—deletes the routing number name associated with the index

Default: No change to the current value

:nidx4= (optional)

This parameter specifies a new routing number name for VMRN index 4.

Range: *ayyyyyyy*, **none**
1 alphabetic character followed by up to 7 alphanumeric characters
none—deletes the routing number name associated with the index

Default: No change to the current value

:nidx5= (optional)

This parameter specifies a new routing number name for VMRN index 5.

Range: *ayyyyyyy*, **none**
1 alphabetic character followed by up to 7 alphanumeric characters
none—deletes the routing number name associated with the index

Default: No change to the current value

:nidx6= (optional)

This parameter specifies a new routing number name for VMRN index 6.

Range: *ayyyyyyy*, **none**
1 alphabetic character followed by up to 7 alphanumeric characters
none—deletes the routing number name associated with the index

Default: No change to the current value

:nidx7= (optional)

This parameter specifies a new routing number name for VMRN index 7.

Range: *ayyyyyyy*, **none**
1 alphabetic character followed by up to 7 alphanumeric characters
none—deletes the routing number name associated with an index

Default: No change to the current value

:nidx8= (optional)

This parameter specifies a new routing number name for VMRN index 8.

Range: *ayyyyyyy*, **none**
1 alphabetic character followed by up to 7 alphanumeric characters
none—deletes the routing number name associated with an index

Default: No change to the current value

:nid_x9= (optional)

This parameter specifies a new routing number name for VMRN index 9.

Range: *ayyyyyyy*, **none**
 1 alphabetic character followed by up to 7 alphanumeric characters
none—deletes the routing number name associated with an index

Default: No change to the current value

Example

The following example updates the specified VMS ID with a new routing number name for index 5. It also removes the routing number name associated with index 1.

```
chg-vflx-vmsid:id=1234ae5:nidx1=none:nidx5=rname1
```

Dependencies

The V-Flex feature must be enabled before this command can be entered.

The value specified for the **id** parameter must already exist in the VMSID table.

The routing number name of the entry specified by the **id** parameter must already exist in the Routing Number table.

At least one of the optional parameters must be specified.

At least one parameter value must be different from the values provisioned for the table entry.

The value specified for the **rname** parameter must already exist in the Routing Number table.

Output

```
chg-vflx-vmsid:id=1234ae5:nidx1=none:nidx5=rname1
```

```
rlghncxa03w 08-05-07 11:43:04 EST EAGLE 39.0.0
```

```
CHG-VFLX-VMSID: MASP A - COMPLTD
```

```
;

chk-unref-ent

Check Unreferenced Entities

Use this command to check for unreferenced entities in the STP gateway screening entity sets. Unreferenced entities are those entities not referenced by another entity using the next screening function identifier and next screening reference combination, or using the linkset screening reference.

Keyword: **chk-unref-ent**

Related Commands: **aud-data**, **chg-scr-aftpc**, **chg-scr-blkdpc**, **chg-scr-blkopc**, **chg-scr-cdpa**, **chg-scr-cgpa**, **chg-scr-destfld**, **chg-scr-dpc**, **chg-scr-opc**, **chg-scr-sio**, **chg-scr-tt**, **chg-scrset**, **dlt-scr-aftpc**, **dlt-scr-blkdpc**, **dlt-scr-blkopc**, **dlt-scr-cdpa**, **dlt-scr-cgpa**, **dlt-scr-destfld**, **dlt-scr-dpc**, **dlt-scr-opc**, **dlt-scr-sio**, **dlt-scr-tt**, **dlt-scrset**, **ent-scr-aftpc**, **ent-scr-blkdpc**, **ent-scr-blkopc**, **ent-scr-cdpa**, **ent-scr-cgpa**, **ent-scr-destfld**, **ent-scr-dpc**, **ent-scr-opc**, **ent-scr-sio**, **ent-scr-tt**, **ent-scrset**

Command Class: Database Administration

Parameters

:aftpc= (optional)

This parameter specifies whether to audit the affected PC/SSN entity set.

Range: **yes**, **no**

Default: **no**

:all= (optional)

This parameter specifies whether to audit all of the entity sets.

Range: **yes**, **no**

Default: **no**

:blkdpc= (optional)

This parameter specifies whether to audit the blocked DPC entity set.

Range: **yes, no**

Default: **no**

:blkopc= (optional)

This parameter specifies whether to audit the blocked OPC entity set.

Range: **yes, no**

Default: **no**

:cdpa= (optional)

This parameter specifies whether to audit the allowed CDPA entity set.

Range: **yes, no**

Default: **no**

:cgpa= (optional)

This parameter specifies whether to audit the allowed CGPA entity set.

Range: **yes, no**

Default: **no**

:destfld= (optional)

This parameter specifies whether to audit the affected DESTFLD entity set.

Range: **yes, no**

Default: **no**

:dpc= (optional)

This parameter specifies whether to audit the allowed DPC entity set.

Range: **yes, no**

Default: **no**

:isup= (optional)

This parameter specifies whether to audit the ISUP message type entity set.

Range: **yes, no**

Default: **no**

:opc= (optional)

This parameter specifies whether to audit the allowed OPC entity set.

Range: **yes, no**

Default: **no**

:sio= (optional)

This parameter specifies whether to audit the allowed SIO entity set.

Range: **yes, no**

Default: **no**

:tt= (optional)

This parameter specifies whether to audit the allowed TT entity set.

Range: **yes, no**

Default: **no**

Example

```
chk-unref-ent:opc=yes:dpc=yes:sio=yes
```

```
chk-unref-ent:all=yes
```

```
chk-unref-ent:all=yes:blkopc=no:blkdpc=no
```

Dependencies

At least one entity set name must be specified.

Notes

None

Output

chk-unref-ent:opc=yes:dpc=yes:sio=yes

ENTITY TYPE—This field displays which entity type is being checked.

UNREFERENCED ENTITIES—This field displays whether the entity type listed is referenced by another entity.

clr-imt-stats

Clear IMT Statistics

Every card in the system has a card location identifier (stenciled on the shelf and provided in all output) and an IMT address. Use this command to clear the following statistics:

- IMT level 1 and level 2 statistics for specified IMT addresses and hourly time period statistics for IMT errors
- Card error and hourly time period statistics for the HMUX or HIPR cards
- All IMT, HMUX, and HIPR error and hourly time period statistics. When hourly time period statistics for the errors are cleared, the current hourly time period number is reset to 0 (zero) on all cards.

Keyword: `clr-imt-stats`

Related Commands: `conn-imt`, `disc-imt`, `rept-imt-info`, `rept-imt-lvl1`, `rept-imt-lvl2`, `rmv-imt`, `rst-imt`, `tst-imt`

Command Class: System Maintenance

Parameters

:all= (optional)

Clear all IMT, HMUX, and HIPR statistics.

Range: `yes, no`

Default: `no`

:e= (optional)

End address. This parameter specifies the IMT address of the last card in the range.

Range: `0-251`

(See the *Installation Manual - EAGLE 5 ISS* for an illustration with IMT addresses).

:eloc= (optional)

End location. Specifies the card location of the last card in the range.

Range: `1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118`

Default: If `sloc` is specified—current `sloc` value

If `sloc` is not specified—`1115`, which corresponds to IMT address 251 (`e=251`).

:eshelf= (optional)

End shelf location for HMUX and HIPR statistics. This parameter specifies the shelf location of the last shelf in the range. (HMUX and HIPR statistics will be cleared if they exist in the range between and including the `sshelf` and `eshelf` locations).

Range: `1100, 1200 -6100`

Default: If `sshelf` is specified—current `sshelf` value.

If `sshelf` is not specified—`6100`.

:s= (optional)

Start address. This parameter specifies the IMT address of the first (or only) card in the range.

Range: `0-251`

(See the *Installation Manual* of your current documentation set for an illustration with IMT addresses).

:sloc= (optional)

Start location. Specifies the card location of the first card in the range.

Range: `1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118`

Default: If `eloc` is specified—current `eloc` value

If `eloc` is not specified—`1201`, which corresponds to IMT address 0 (`s=0`).

:sshelf= (optional)

Start shelf location for HMUX, and HIPR statistics. This parameter specifies the shelf location of the first shelf in the range. (HMUX, and HIPR statistics will be cleared if they exist in the range between and including the **sshelf** and **eshelf** locations).

Range: 1100, 1200-6100

Default: If **eshelf** is specified—current **eshelf** value.
If **eshelf** is not specified—1100.

Example

```
clr-imt-stats:s=00
```

Dependencies

The **clr-imt-stats** command cannot be entered if any of the following commands is running: **rept-imt-info**, **rept-imt-lvl1**, **rept-imt-lvl2**, **tst-imt**.

If the **s** and **e** parameters are specified, do not specify the **sloc** and **eloc** parameters; conversely, if the **sloc** and **eloc** parameters are specified, do not specify the **s** and **e** parameters.

This command cannot be entered during IMT statistics collection following an hourly boundary.

Either the start address (**s** parameter) or start location (**sloc** parameter) must be specified.

This command cannot be entered during an Extended Bit Error Rate Test (BERT).

Notes

The **sloc** and **eloc** parameters allow individual HMUX and HIPR cards to be cleared

The **s** and **e** parameters will not clear HMUX and HIPR cards.

The **sshelf** and **eshelf** parameters clear HMUX and HIPR cards on bus A and bus B.

Output

```
clr-imt-stats:all=yes
rlghncxa03w 04-01-07 11:02:30 EST EAGLE 35.0.0
Clear IMT Statistics command(s) issued...
Command Completed.
;
```

conn-imt

Connect IMT

Use this command to connect a manually disconnected card to the specified IMT bus. The card must have been manually disconnected from the bus previously by the **disc-imt** command. If the card was disconnected from the bus for other reasons, this command has no effect.

Keyword: conn-imt

Related Commands: **clr-imt-stats**, **disc-imt**, **rept-imt-lvl1**, **rept-imt-lvl2**, **rept-stat-imt**, **rmv-imt**, **rst-imt**

Command Class: System Maintenance

Parameters

:bus= (mandatory)

IMT bus to which the specified card is to be connected.

Range: a, b

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118,

3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

```
conn-imt:loc=1201:bus=a
```

Dependencies

The card being reconnected must first be disconnected manually from the bus by using the **disc-imt** command.

This command cannot be entered during an IMT Fault Isolation Test or an Extended Bit Error Rate Test (BERT).

The card location, frame, shelf, or slot must be within the allowed range.

Notes

This command has no effect if the card was disconnected from the IMT bus in any way other than manually using the **disc-imt** command.

Output

```
conn-imt:loc=1201:bus=a
rlghncxa03w 04-01-07 11:02:30 EST EAGLE 31.3.0
Connect IMT Bus A command issued to card 1201

rlghncxa03w 04-01-07 11:02:30 EST EAGLE 31.3.0
3112.0006 CARD 1201 CCS7ITU Card connected to IMT
;
```

copy-disk

Copy Disk

Use this command to copy a mirror image of the active fixed disk to the standby fixed disk. When the fixed disk requires replacement, or needs to be repaired or updated, this command formats the standby fixed disk and copies the contents of the active fixed disk to the standby fixed disk.

CAUTION: Before entering the copy-disk command, contact the Customer Care Center.

CAUTION: If the copy-disk command fails and the standby TDM boots continuously, insert a removable disk with the same release as the fixed disks in the MDAL. The standby MASP should successfully boot off the removable disk. After the MASP has booted completely, re-enter the copy-disk command.

Keyword: copy-disk

Related Commands: chg-db, copy-gpl, copy-meas, disp-disk-dir, format-disk, rept-stat-db

Command Class: System Maintenance

Parameters

:dloc= (mandatory)

This parameter must specify the location of the standby fixed disk. This is the destination drive for this function.

Range: 1114, 1116
(TDM)

:force= (optional)

This parameter provides some protection against data loss from copying over a fixed disk. If the target medium is recognized as a valid system medium, the **force=yes** parameter must be specified.

Range: yes, no

Default: no

:format= (optional)

This parameter provides the choice whether or not to format the standby fixed disk before executing the copy. If a format is not necessary, specifying **no** can save a significant amount of time.

Range: yes, no

Default: yes

:sloc= (optional)

This parameter must specify the location of the active fixed disk. This will be the source drive for this function.

Range: 1114, 1116
(TDM)

Default: The location of the active fixed disk

Example

```
copy-disk:sloc=1114:dloc=1116:force=yes
```

Dependencies

CAUTION: Do not turn off measurements at midnight because doing so can cause the loss of an entire day of measurements. Do not turn off measurements during the 30 minute measurements processing period, because this can result in the loss of the measurements for the 30 minute period being processed.

Measurements collection must be turned off or the **copy-disk** command cannot be executed. Do not issue the **chg-meas** command while the **copy-disk** command is in progress. This results in read and write errors, because the standby fixed disk is not accessible and the active fixed disk only allows read-only access.

OAM Measurements collection cannot be in progress when this command is entered. Retry the command after a period of waiting for the measurements collection to complete.

The **copy-disk** command reserves both the active and standby disks, preventing database updates for the duration of the command. Access is allowed for read-only; writing to the disk is prohibited.

All commands that affect the database are not allowed for the duration of the command. Attempts to use such commands are rejected, and an error message is displayed indicating that the command has been rejected because the **copy-disk** command is in use.

The EOAM GPL version that is running in the active OAM card location must be the same GPL version that is running in the standby OAM card location.

The **sloc** and **dloc** fixed disks must be available and compatible.

The **sloc** fixed disk must be coherent.

The **dloc** parameter must specify the standby fixed disk.

The **sloc** parameter must specify the active fixed disk.

The standby fixed disk cannot be initialized while un-uploaded security log entries exist.

The **force=yes** parameter is required if the destination medium is recognized as a system medium. This parameter is optional if the destination medium is not a system medium. Only media that contain the **dms.cfg** file are recognized as system media.

If the **force=yes** parameter is specified, the disk should not require low-level formatting, and the **format=no** parameter should also be specified.

If the OAM is in mixed mode, and the 10,000 Routesets or Integrated GLS feature is enabled or the Integrated Measurements feature is turned on, then this command cannot be entered

Notes

The **format=no** parameter should be specified when upgrading a spare TDM. You should specify the **format=yes** parameter when there is a suspected hardware problem.

If the **copy-disk** command is initiated and the standby OAM initialization is not complete, command processing will be delayed. If standby initialization fails, the command proceeds to allow the standby TDM to recover from a previous **format-disk** or **copy-disk** failure. In such cases, the following messages appear:

```
Standby MASP has not finished initializing - please wait...
Standby MASP initialization timed out - continuing...
```

The **format=no** parameter should be specified when upgrading a spare TDM. the **format=yes** parameter should be specified when there is a suspected hardware problem.

If the **copy-disk** command is initiated and the standby OAM initialization is not complete, command processing will be delayed. If standby initialization fails, the command proceeds to allow the standby TDM to recover from a previous **format-disk** or **copy-disk** failure. In such cases, the following messages appear:

```
Standby MASP has not finished initializing - please wait...
Standby MASP initialization timed out - continuing...
```

When the **copy-disk** command is processing, the system cannot log other commands to the security log because the active fixed disk is set to read-only. During this time, commands that would alter the database fail when entered.

The performance time required to copy a fixed disk to another fixed disk varies depending on database size and system activity. This operation should typically take no longer than 2.5 hours. (If the low-level format (**format=no**) is not being performed, the operation should take no longer than an hour.) If the **copy-disk** operation exceeds three hours, or if the **copy-disk** operation without the low-level format exceeds 1.5 hours, contact the Customer Care Center. See the "Customer Care Center" section in Chapter 1 of this manual.

Output

copy-disk:sloc=1114:dloc=1116:force=yes

```
rlghncxa03w 04-01-07 11:02:30 EST EAGLE 31.3.0
copy-disk:sloc=1114:dloc=1116:force=yes
Command entered at terminal #3.
```

```
Copy-disk (fixed): from active (1114) to standby (1116) started.
Extended processing required, please wait.
```

```
Copy-disk (fixed): from active (1114) to standby (1116) completed.
Measurements collection may be turned on now if desired.
```

copy-ext-stats

Copy Extended Statistics

Use this command to copy the HIPR2 Extended Statistics information from the HIPR2 cards to the EXTSTATS.SYS file.

Keyword: copy-ext-stats
Related Commands: init-ext-stats
Command Class: System Maintenance

Parameters

:bus= (optional)

This parameter specifies the IMT bus containing the HIPR2 cards with the extended statistics to be copied.

Range: **a, b, both**
a— HIPR2 cards on the A bus
b— HIPR2 cards on the B bus
both— HIPR2 cards on both buses

Default: **both**

:eloc= (optional)

This parameter specifies the ending card location for a range of HIPR2 cards that contain extended statistics to be copied.

NOTE: Statistics are copied from only valid In-Service Normal HIPR2 cards within the range.

Range: **1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110**

Default: **6110**

:loc= (optional)

The location of a single HIPR2 card that contains extended statistics to be copied.

Range: **1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110**

Default: all HIPR2 cards within the range specified by the **sloc** and **eloc** parameters

:mode= (optional)

This parameter specifies a bitmask where the numeric value entered is converted to its binary value. Each bit represents a unique set of data to retrieve.

This parameter is currently unused.

Range: **0-65535**
Default: **0**

:sloc= (optional)

This parameter specifies the starting card location of a range of HIPR2 cards that contain extended statistics to be copied.

NOTE: Statistics are copied from only valid In-Service Normal HIPR2 cards within the range.

Range: **1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110**

Default: **1109**

Example

```
copy-ext-stats
copy-ext-stats:loc=1110
copy-ext-stats:mode=1:loc=1109
```

```
copy-ext-stats:sloc=1101:eloc=6118:b=a
```

```
copy-ext-stats:sloc=1209:eloc=1210
```

Dependencies

Numeric values must be specified for the **loc**, **sloc**, and **eloc** parameters. These values must indicate valid card locations. See the associated parameter definitions for lists of valid values.

A value of **a**, **b**, or **both** must be specified for the **bus** parameter.

No other **init-ext-stats** or **copy-ext-stats** command can be in progress when this command is entered.

The **loc** parameter cannot be specified in the same command with the **sloc** and **eloc** or **bus** parameters.

The value specified for the **loc** parameter must be a valid MUX card location.

The range specified by the **sloc** and **eloc** parameters must include an MUX card location.

Output

copy-exts-stats

```

```

copy-fts**Copy to or from the File Transfer Area**

Use this command to copy tables into or from the file transfer area (FTA).

Keyword: copy-fts

Related Commands: act-file-trns, disp-fts-dir, dlt-fts

Command Class: System Maintenance

Parameters

:dloc= (mandatory)

The card location of the destination or table.

Range: 1114, 1116, 1117, 1113, 1115

1114 — The TDM

1116 — The TDM

1117 — The removable cartridge drive

1113 — The latched USB port

1115 — The latched USB port

:sloc= (mandatory)

The card location of the source location or table.

Range: 1114, 1116, 1117, 1113, 1115

1114 — The TDM

1116 — The TDM

1117 — The removable cartridge drive

1113 — The latched USB port

1115 — The latched USB port

:dfile= (optional)

The name of the file that was copied into the FTA.

Range: *////////////////////////////////////*

The name of the file with its extension.

:dtbl= (optional)

The identifying number of the destination table.

Range: 0-511

:sfile= (optional)

The name of the file in the FTA to be copied.

Range: *////////////////////////////////////*

The name of the file with its extension

:stbl= (optional)

The identifying number of the source table.

Range: 0-511

Example

```
copy-fts:sloc=1114:dloc=1114:stbl=2:dfile="F1_name.OUT"
```

```
copy-fts:sfile=dms.cfg:dtbl=0:sloc=1114:dloc=1116
```

Dependencies

A destination table must be specified when a source file is specified.

A destination file must be specified when a source table is specified.

A source and a destination must be specified.

Only one source parameter and one destination parameter can be specified.

This command cannot be entered to modify the security log.

File name formats are limited to 8 + 3 DOS-compatible characters.

When using DOS file names, if the file name contains a special character such as an underscore (_) or begins with a numeric, the file name must be in quotes (" "), for example, "**92_name.ext**".

Only one file transfer can be active at a time.

The **1117** location is used by MDAL cards. The **1113** and **1115** locations are used by E5-MCAP cards. The **1114** and **1116** locations are used by TDM or E5-TDM cards.

Legacy TDM, GPSM-II, and MDAL cards cannot be installed in the same system as E5-TDM, E5-MCAP, and E5-MDAL cards.

Notes

This command is used to copy into the file transfer area or out of the file transfer area. The parameters **stbl**, **dfile**, **sfile**, and **dtbl** are used to describe the nature of the copy. A copy from a DMS table into the file transfer area would use the **stbl** (source table) and **dfile** (destination file) parameters. Thus, data would move from a table into a transfer area file. To copy from the file transfer area to a DMS table, use the **sfile** (source file) and **dtbl** (destination table) parameters. Any other combination of these 4 parameters is invalid.

Output

```
copy-fts:stbl=1:dfile="2F1.OUT":sloc=1114:dloc=1114
```

```
rlghncxa03w 04-01-05 14:59:10 EST EAGLE 31.3.0
copy-fts:stbl=1:dfile="2F1.OUT":sloc=1114:dloc=1114
Command entered at terminal #1.
;
rlghncxa03w 04-01-05 14:59:26 EST EAGLE 31.3.0
Copied Table 1 successfully from FIXED to F1.OUT in FTA.
;

Command entered at terminal #1.
;
rlghncxa03w 04-01-05 15:01:12 EST EAGLE 31.3.0
Copied DMS.CFG successfully from FTA to Table 0 on REMOVABLE.
;
```

copy-gpl

Copy Generic Program Load

Use this command to copy all approved GPLs from one drive to another. The GPLs can be copied only from the fixed disk on the active TDM to the removable cartridge or drive, or from the removable cartridge or drive to the fixed disk on the standby TDM.

Keyword: copy-gpl

Related Commands: act-gpl, alw-card, chg-gpl, init-card, init-sys, rept-stat-gpl, rtrv-gpl

Command Class: System Maintenance

Parameters

:drv= (optional)

Destination drive. This parameter specifies the identification of the disk to which the GPL is copied.

Range: **fixed, remove, usb**

fixed — The fixed disk

remove — The removable cartridge or drive

usb — Argument to be used by Tekelec personnel only.

:dloc= (optional)

The destination location of the the GPLs to be copied.

Range: **1114, 1116, 1117, 1113, 1115**

1114 — The TDM

1116 — The TDM
1117 — The removable cartridge drive
1113 — The latched USB port
1115 — The latched USB port

Default: **1117**

:sdrv= (optional)

Source drive. This parameter specifies the identification of the disk from which the GPL is copied.

Range: **fixed, remove, usb**

fixed — The fixed disk

remove — The removable cartridge or drive

usb — Argument to be used by Tekelec personnel only.

:sloc= (optional)

The source location of the the GPLs to be copied.

Range: **1114, 1116, 1117, 1113, 1115**

1114 — The TDM

1116 — The TDM

1117 — The removable cartridge drive

1113 — The latched USB port

1115 — The latched USB port

Default: The location of the active TDM

Example

```
copy-gpl
```

```
copy-gpl : sloc=1117 : dloc=1116
```

```
copy-gpl : sloc=1116
```

Dependencies

While this command is executing, the **chg-gpl** and **act-gpl** commands cannot be entered.

The destination disk needs to be formatted.

The GPLs can be copied only from the fixed disk on the active TDM (**sloc=1114** or **sloc=1116**) to the removable cartridge (**dloc=1117**), or from the removable cartridge (**sloc=1117**) to the fixed disk on the standby TDM (**dloc=1114** or **dloc=1116**).

The source drive must be coherent when the command is executed.

The **1117** location is used by MDAL cards. The **1113** and **1115** locations are used by E5-MCAP cards. The **1114** and **1116** locations can be used by TDM or E5-TDM cards.

The specified disk type does not match the specified location.

Notes

This command has no effect on the GPLs stored on other cards (for example, SCCP).

Output

Copying the GPLs from the fixed disk on the active TDM (card location 1114) to the removable cartridge.

```
copy-gpl:sloc=1114:dloc=1117
rlghncxa03w 04-01-07 00:57:31 EST EAGLE 31.3.0
COPY GPL: MASP A - COPY STARTS ON ACTIVE MASP
COPY GPL: MASP A - COPY TO REMOVABLE CARTRIDGE COMPLETE
;
```

Copying the GPLs from the removable cartridge to the fixed disk on the standby TDM (card location 1116).

```
copy-gpl:sloc=1117:dloc=1116
rlghncxa03w 09-01-07 00:57:31 EST EAGLE 40.1.0
COPY GPL: MASP B - COPY STARTS ON REMOVABLE DRIVE
;

rlghncxa03w 09-01-07 01:01:27 EST EAGLE 40.1.0
COPY GPL: MASP B - COPY TO STANDBY MASP COMPLETE
;
```

Copying the GPLs from the fixed disk on the active USB drive.

```
copy-gpl:sloc=1114:ddrv=usb
e5oam 09-01-09 05:14:23 MST EAGLE 40.1.0
COPY GPL: MASP A - COPY STARTS ON ACTIVE MASP
;

e5oam 09-01-09 05:22:30 MST EAGLE 40.1.0
COPY GPL: MASP A - COPY TO USB DRIVE COMPLETE
```

copy-meas**Copy Measurements**

Use this command to copy all measurements tables on the active fixed disk to a measurements removable cartridge. Do this when you need to perform off-line analysis of the raw measurements data.

NOTE: This command is not supported on the Measurements Platform feature.

Keyword: copy-meas

Related Commands: chg-meas, rept-meas, rtrv-meas-sched

Command Class: System Maintenance

Parameters

None

Example

```
copy-meas
```

Dependencies

The removable cartridge or removable drive:

- must be inserted
- must be initialized
- must be a MEAS disk
- cannot be a SYSTEM disk

Notes

To execute this command, measurement collection must be turned **off**. If measurement collection is on, enter the **chg-meas:collect=off** command to turn off measurement collection.

The *Maintenance Manual* provides a description of all measurement report parameters.

To copy the raw measurements data from the active fixed disk to the measurements removable cartridge requires approximately 2 minutes. This period is the minimum time and is dependent on system activity.

Output

copy-meas

```
COPY MEASUREMENTS: MASP A - COPY STARTS ON ACTIVE MASP
COPY MEASUREMENTS: MASP A - COPY TO REMOVABLE CARTRIDGE COMPLETE
;
```

copy-seculog

Copy Security Log Contents to FTA Area

Use this command to copy the contents of a security log to the file transfer area (FTA). If no parameters are specified, a file called **yymmdda.log** (see the description of the **dfile** parameter) is created in the FTA on the active fixed disk. The contents of the security log on the active fixed disk are copied into this file.

Keyword: copy-seculog

Related Commands: act-file-trns, copy-tbl, disp-fts-dir, dlt-fts

Command Class: Security Administration

Parameters

:dfile= (optional)

Target file name. This parameter specifies the name of the file that is to be created in the FTA and initialized with the security log contents.

Range: `////////////////////`
1–32 characters

Default: If not specified, the file is named *yymmddx.log*, where *yymmdd* is the current year, month, and day, and *x* is either *a* or *s*, depending on whether the log on the active or standby fixed disk was copied.

:dloc= (optional)

Destination FTA. This parameter specifies which FTA is to receive the copy of the log.

Range: **act, stb**
act—Copies the log to the active fixed disk's FTA
stb—Copies the log to the standby fixed disk's FTA

Default: **act**

:slog= (optional)

Source log indicator. This parameter specifies which log is to be copied to the FTA.

Range: **act, stb**
act—Copies the log on the active fixed disk
stb—Copies the log on the standby fixed disk

Default: **act**

Example

```
copy-seculog
copy-seculog:dfile="somename.log"
```

```
copy-seculog:slog=stb
copy-seculog:slog=act
copy-seculog:slog=act:dloc=stb
```

Dependencies

No other security log command can be in progress when this command is entered.

No **copy-fta** command can be in progress when this command is entered.

GPSM-II and E5-MCAP cards cannot be provisioned in the system at the same time.

Notes

For the **dfile** parameter, if the file name is not accepted by the system because it contains special characters such as blanks, colons, dashes, ampersands, or others; or because it does not start with an alphabetic character, enclose the file name in double quotes (Copies t) as in this example: Copies t.

Any scroll area failure message that can be produced by the **copy-fta** command can be produced also by the **copy-seculog** command.

Output

The following example shows that the log on the active fixed disk is copied to the FTA on the active fixed disk and given the default name (note the **a** in the log name).

```
copy-seculog
rlghncxa03w 04-01-04 15:59:06 EST EAGLE 31.3.0
Security log on TDM 1114 copied to file 960104a.log on TDM 1114
```

The following example shows that the log on the active fixed disk is copied to the FTA on the active fixed disk and given a user-specified name.

```
copy-seculog:dfile="somename.log"
rlghncxa03w 04-01-04 15:59:06 EST EAGLE 31.3.0
Security log on TDM 1116 copied to file somename.log on TDM 1114
```

The following example shows that the log on the standby fixed disk is copied to the FTA on the active fixed disk and given the default name (note the **s** in the log name).

```
copy-seculog:slog=stb
rlghncxa03w 04-01-04 15:59:06 EST EAGLE 31.3.0
Security log on TDM 1114 copied to file 960104s.log on TDM 1116
```

The following example shows that the copy of the log fails because a file already exists in the FTA with the same name.

```
copy-seculog:slog=act
rlghncxa03w 04-01-04 15:59:06 EST EAGLE 31.3.0
Command Failed - Destination File already exists in the File Transfer Area
```

The following example shows that the copy fails because there is not enough room in the FTA to contain the copy.

```
copy-seculog:slog=act:dloc=stb
rlghncxa03w 04-01-04 15:59:06 EST EAGLE 31.3.0
Command Failed - Not enough room exists in the File Transfer Area
```

dact-alm-trns

Deactivate Alarm Transfer

Use this command to return all audible alarm indications to the local office.

Keyword: dact-alm-trns

Related Commands: act-alm-trns, rept-stat-clk, rept-stat-trbl, rls-alm, rtrv-obit, rtrv-trbl

Command Class: System Maintenance

Parameters

This command has no parameters.

Example

```
dact-alm-trns
```

Dependencies

None

Notes

After you enter **dact-alm-trns**, enter **rept-stat-alm** to verify the status of the alarms.

Output

```
dact-alm-trns
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Alarms returned to Local Maintenance Center
;
```

dact-cdl**Deactivate Command Driven Loopback**

Use this command to deactivate a previously initiated command driven loopback for testing a signaling link, if the test is active. If it is not active, the command will attempt to clear both near-end and far-end latched loopback points

Keyword: **dact-cdl**

Related Commands: **act-cdl, act-lbp, dact-lbp, rept-stat-cdl, tst-slk**

Command Class: Link Maintenance

Parameters

:link= (mandatory)

SS7 signaling ports. The signaling port to which the SS7 signaling link being tested is assigned.

Synonym: **port**

Range: **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling links.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Example

```
dact-cdl:loc=1205:link=b
```

Dependencies

The card location specified in the **loc** parameter must be equipped.

The signaling link specified in the **link** parameter must be equipped.

Link Fault Sectionalization (LFS) must not be running on the specified signaling link when this command is entered.

Command Driven Loopback testing is not available during upgrade.

A link diagnostic test is in progress on the signaling link specified in the **link** parameter, but it is not a Command Driven Loopback.

The card location specified in the **loc** parameter must be in service.

The signaling link specified in the **link** parameter must not be active.

The card location specified in the **loc** parameter cannot be reserved by the system.

Notes

None

Output

dact-cdl:loc=1205:link=b

```
tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
Command Accepted: Stop Command Driven Loopback message is sent.
```

;

```
tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
Command Completed.
```

;

dact-cmd

Deactivate Command

This command halts processing and output of the following commands: **copy-ext-stats**, **dact-cmd**, **rept-imt-info**, **rept-stat-as**, **rept-stat-assoc**, **rept-stat-card**, **rept-stat-clk**, **rept-stat-dstn**, **rept-stat-ls**, **rept-stat-rte**, **rept-stat-slk**, **rept-stat-trbl**, **rtrv-appl-rtkey**, **rtrv-as**, **rtrv-assoc**, **rtrv-cmd**, **rtrv-dstn**, **rtrv-gta**, **rtrv-gtt**, **rtrv-lbp**, **rtrv-log**, **rtrv-ls**, **rtrv-map**, **rtrv-mrn**, **rtrv-obit** (active OAM), **rtrv-rte**, **rtrv-seculog**, **rtrv-secu-user**, **rtrv-slk**, **rtrv-tbl-capacity**, **rtrv-trbltx**, **rtrv-uaps**, **rtrv-vflx-cd**, **rtrv-vflx-rn**, **rtrv-vflx-vmsid**

NOTE: The Basic command class allows use of this command without the **trm** parameter (for **dact-cmd**); the Security Administration command class is required for use of this command when the **trm** parameter is specified (**dact-cmd:trm=x**).

NOTE: Entering the **dact-cmd** command without the **trm** parameter executes the command on the terminal that is running the **dact-cmd** command. Entering the command with the **trm** parameter executes the command on the terminal specified by the **trm** parameter.

NOTE: Used without the **trm** parameter, the **dact-cmd** command is entered on the same terminal that is currently running the command that you want to cancel. Used with the **trm** parameter, the **dact-cmd** command is entered on a terminal other than the one that is currently running the command that you want to cancel.

Keyword: **dact-cmd**

Related Commands: **copy-ext-stats**, **rept-imt-info**, **rept-stat-as**, **rept-stat-assoc**, **rept-stat-card**, **rept-stat-dstn**, **rept-stat-ls**, **rept-stat-slk**, **rtrv-appl-rtkey**, **rtrv-assoc**, **rtrv-dstn**, **rtrv-gta**, **rtrv-gtt**, **rtrv-log**, **rtrv-ls**, **rtrv-map**, **rtrv-obit**, **rtrv-rte**, **rtrv-seculog**, **rtrv-slk**, **rtrv-trbltx**, **rtrv-uaps**

Command Class: Basic

Parameters

:trm= (optional)

The terminal on which the command is to be canceled.

Range: 1-40

Example

```
dact-cmd
```

```
dact-cmd:trm=3
```

Dependencies

You cannot specify the **trm** parameter in a **dact-cmd** command that you enter on the same terminal that is running the command that you want to cancel. The terminal will return an error: system is busy.

The **dact-cmd:trm=** command requires the security administration command class for the terminal and for the user.

Notes

The **dact-cmd** command (without the **trm** parameter) must be entered on the same terminal that is running the command you want to cancel.

If the **dact-cmd** command is entered on a terminal that is not running a command, the **dact-cmd** command completes successfully without returning an error. Likewise, if the **dact-cmd:trm=** command is entered and there is no command running on the specified terminal, the **dact-cmd:trm=** command completes successfully without returning an error.

Command aborted on terminal 2.

You might still see some output after the abort message if output accumulated in the output queue before you issued the **dact-cmd** command. When you cancel a command, the cancellation should take no longer than 25 seconds to take effect.

The **F9** function key provides the same functionality as the **dact-cmd** command (without the **trm** parameter). On a terminal in KSR mode, pressing <CTRL>I, also provides the same function.

The **dact-cmd** and the **F9** function key cannot be used for pure SEAS commands.

If you try to cancel a command other than one listed in , the terminal accepts the command, but output and processing of the current command continue.

When the **dact-cmd** command is entered, a command status code of AB (command aborted) is logged in the security log as follows:

- When the **dact-cmd** (without the **trm** parameter) is entered, no entry is logged.
- When the **dact-cmd:trm=** command is entered, an entry is logged.
- When the **dact-cmd** (without the **trm** parameter) is entered as a SEAS flow-thru command, an entry is logged. The **dact-cmd:trm=** command is not allowed as a SEAS flow-thru command because the **dact-cmd:trm=** command belongs to the Security Administration Command Class.

For examples of the security log entries, see the **rtrv-seculog** command.

Output

```

dact-cmd
rlghncxa03w 04-04-27 17:00:36 EST  EAGLE 31.6.0
dact-cmd
Command entered at terminal #2.

rlghncxa03w 04-04-27 17:00:36 EST  EAGLE 31.6.0
Command aborted on terminal 2.
;

dact-cmd:trm=2
rlghncxa03w 04-04-27 17:00:36 EST  EAGLE 31.6.0
dact-cmd:trm=2
Command entered at terminal #3.

rlghncxa03w 04-04-27 17:00:36 EST  EAGLE 31.6.0
Command aborted on terminal 2.
;

```

dact-echo**Deactivate Echo**

Use this command to halt the echoing of command responses from the user's terminal to other terminals or printers.

Keyword: **dact-echo**

Related Commands: **act-echo, alw-trm, canc-echo, chg-trm, inh-trm, rept-stat-trm, rmv-trm, rst-trm, rtrv-trm**

Command Class: Basic

Parameters

:trm= (optional)

The ID number of the terminal for which the echo is being canceled.

Range: **1-16**

Default: Cancels all active echoes

Example

```
dact-echo
```

Dependencies

You cannot cancel the echo to the same terminal from which you are issuing the **dact-echo** command.

There must be an active echo (**act-echo**) to the terminal specified.

Notes

Only the echoing of command output responses can be halted by this command. To halt the printing of alarm and network messages, you must use the **chg-trm** command.

Output

```

dact-echo
rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0
Command entered at terminal #6.
Scroll Area Output echo disabled to all terminals.
;

dact-echo:trm=7
rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0
Command entered at terminal #1.
Scroll Area Output echo disabled for terminal 7.
;

```

dact-ip-lnk**Deactivate IP Link**

Use this command to deactivate an IP link and put the link out of service. The state of the link is changed from IS-NR (In-Service-Normal), IS-ANR (In-Service-Abnormal), or OOS-MT (Out-Of-Service-Maintenance) to OOS-MT-DSBLD (Out-Of-Service-Maintenance-Disabled).

NOTE: The specified card must be Active before the command can be executed. If the card boots, then the status of the IP link will be reset.

Keyword: dact-ip-lnk

Related Commands: act-ip-lnk, rept-stat-card, rept-stat-mon

Command Class: Link Maintenance

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118, 1113, 1115

:port= (mandatory)

Ethernet interface Port ID.

Range: a, b, fca, fcb
 a — IP Port A
 b — IP Port B
 fca — Fast Copy Port A
 fcb — Fast Copy Port B

Example

```
dact-ip-lnk:loc=1102:port=a
```

```
dact-ip-lnk:loc=1203:port=fca
```

Dependencies

The value specified for the **loc** parameter must refer to one of the following cards, and the referenced card must be equipped:

- E5-ENET or E5-ENET-B card running the EROUTE, IPGWx, IPLIMx, IPSG or SLAN application
- E5-IPSM or E5-ENET-B card running the IPS application
- E5-SM4G or E5-SM8G-B card running the VSCCP application
- E5-OAM card running the OAMHC application
- E5-MCPM-B card running the MCP application

The card location must be specified from the given range of argument values of **loc** parameter.

The value specified for the **port** parameter must be supported by the card:

- E5-OAM card running the OAMHC application, E5-IPSM or E5-ENET-B card running the IPS application, E5-MCPM-B card running the MCP application, E5-ENET or E5-ENET-B card running the SLAN application — port **a** only

- E5-ENET or E5-ENET-B card running the EROUTE or IPLIMx application, E5-SM4G or E5-SM8G-B card running the VSCCP application — port **a, b**
- E5-ENET or E5-ENET-B card running the IPGWx or IPSG application—port **a, b, fca, fcb**

The card at the specified location must be configured.

The card at the specified location must be Active before the **dact-ip-lnk** command can be executed.

Output

dact-ip-lnk:loc=1101:port=a

Command Accepted - Processing

```
tekelecstp 11-08-16 18:35:44 MST EAGLE 44.0.0
dact-ip-lnk:loc=1101:port=a
Command entered at terminal #1.
```

```
tekelecstp 11-08-16 18:35:44 MST UNKNOWN EAGLE 44.0.0
Deactivate IP link message sent to card.
```

;

```
tekelecstp 11-08-16 18:35:44 MST EAGLE 44.0.0
Command Completed.
```

;

dact-lbp

Deactivate Loopback Point Test

Use this command to deactivate a previously activated loopback point test, if a test is active. If no test is active, the command attempts to clear both near-end and far-end latched loopback points.

Keyword: **dact-lbp**

Related Commands: **act-lbp, chg-lbp, dlt-lbp, ent-lbp, rept-stat-lfs, rtrv-lbp**

Command Class: Link Maintenance

Parameters

:link= (mandatory)

SS7 signaling link. The signaling link for which the loopback point test is being deactivated.

Synonym: **port**

Range: **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

:loc= (mandatory)

Card location. The unique identifier of the card containing the signaling link on which loopback point testing is to be deactivated.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Example

```
dact-lbp:loc=1205:link=b
```

Dependencies

The specified signaling link must be equipped.

For clearing a remotely initiated loopback or LFS test stop, the card location (**loc** parameter) must be a **limds0**, **limt1**, or **limch** (associated with a **limt1**) card configured with either an **ss7ansi** or **cs7itu** application.

The **dact-lbp** command cannot be entered until any previously issued **act-lbp** or **dact-lbp** command is accepted.

If an LFS test is about to complete, a new **dact-lbp** command cannot be entered until the test completes.

The **dact-lbp** command cannot be entered to cancel a signaling link test (a **tst-slk** test).

The **dact-lbp** command cannot be entered to cancel a Command Driven Loopback test.

The specified link is not found, and the max number of allowed LFS or signaling link tests are already in progress. At least one active LFS or signaling link test must be completed before this command can be entered again.

This command cannot be entered during upgrade.

The specified signaling link must not be active.

For clearing a remotely initiated loopback, the card location specified in the **loc** parameter must be equipped.

For clearing a remotely initiated loopback, The card location specified in the **loc** parameter must be in service (**IS-NR**).

For clearing a remotely initiated loopback, the card location specified in the **loc** parameter cannot be reserved by the system.

Notes

After the deactivation of loopback point testing has started, you cannot cancel the process.

If an LFS test is aborted by a card reset, it could leave the remote far-end loop-back condition active. Use the **dact-lbp** command to cancel LFS tests.

Output

The following example output is generated only when a latched loopback is cleared and when there were no active loopback tests in progress.

NOTE: This situation could occur even if there were no latched loopbacks to be cleared.

```
dact-lbp:loc=1205:link=b
rlghncxa03w 04-02-17 16:02:05 EST  EAGLE5 33.0.0
LOC = 1205  LINK = B
CLEAR STATUS = PASS, loopback was cleared.
;
```

The following example output is generated only when a latched loopback could not be cleared when there were no active loopback tests in progress.

```
dact-lbp:loc=1205:link=b
rlghncxa03w 04-02-17 16:02:05 EST  EAGLE5 33.0.0
LOC = 1205  LINK = B
CLEAR STATUS = ERROR, loopback could not be cleared.
;
```

dact-rstst

Deactivate Route Set Test

Use this command to request deactivation of the routeset test being performed by the LIMs running the **ss7ansi** application. The system verifies that the point code and the linkset exist, and that the

specified linkset is in the routeset of the specified point code. If it is, then a request to stop routeset testing procedures for the specified destination-linkset combination is sent to the LIM.

Keyword: dact-rstst

Related Commands:

Command Class: System Maintenance

Parameters

:dpc= (mandatory)

The ANSI destination point code of the destination, x-list entry, or cluster whose routeset testing is to be stopped, with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: dpca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:lsn= (mandatory)

The name of the linkset associated with the destination point code that is to have routeset testing stopped.

Range: aaaaaaaaaa

1 alphabetic character followed by 9 alphanumeric characters

Example

```
dact-rstst:dpc=1-2-*:lsn=lsn1a
```

```
dact-rstst:dpc=1-2-33:lsn=lsn1b
```

Dependencies

The specified DPC must be either provisioned or an x-list entry.

The specified linkset must be in the DPC's routeset.

The destination address must be a full point code or a cluster point code specified as *ni-nc-**. A DPC cannot be specified as *ni-nc-*** or *ni-nc-**** for the **dact-rstst** command.

The specified linkset must exist in the linkset table.

Notes

None

Output

```
dact-rstst:dpc=1-2-*:lsn=lsn1a
```

```
rlghncxa03w 04-01-05 16:40:40 EST EAGLE 31.3.0
Stop routeset testing request sent to SNM (scroll area)
```

```
rlghncxa03w 04-01-05 16:40:40 EST EAGLE 31.3.0
Command Completed.
```

```
;
```

dact-slk**Deactivate Signaling Link**

Use this command to change the state of the specified link to OOS-MT-DSBLD (out-of-service maintenance-disabled).

CAUTION: This command impacts network performance, and should be used only during periods of low traffic.

Keyword: dact-slk

Related Commands: act-slk, blk-slk, dlt-slk, ent-slk, inh-slk, rept-stat-slk, rtrv-slk, tst-slk, ublk-slk, unhb-slk

Command Class: Link Maintenance

Parameters

:link= (mandatory)

Signaling link on the card specified in the **loc** parameter. The signaling links can be specified in any sequence or pattern.

Synonym: port

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

```
dact-slk:loc=1301:link=a
```

Dependencies

A card location must be specified that is valid and defined in the database.

No other action command can be in progress when this command is entered.

The value specified for the **loc** parameter must refer to one of the following cards, and the referenced card must be equipped:

- E1 ATM card running the ATMITU application
- E1/T1 MIM, E5-E1T1 or HC MIM card running the SS7ANSI or CCS7ITU application
- E5-ATM card running the ATMANSI or ATMITU application
- E5-ENET or E5-ENET-B card running the IPSG application
- E5-ENET, E5-ENET-B, or SSED CM card running the IPLIM or IPLIMI application
- LIM card running the SS7ANSI or CCS7ITU application
- LIM ATM card running the ATMANSI application

The card must contain signaling links.

The signaling link must be equipped in the database.

The card must be equipped in the specified card location.

An appropriate value must be specified for the **link** parameter when an ATM card is used:

- **a**—E1-ATM card running the ATMITU application or the LIM-ATM card running the ATMANSI application
- **a-a1, b**—E5-ATM or E5-ATM-B card running the ATMANSI or ATMITU application

Notes

The *Installation Manual – EAGLE 5 ISS* provides an illustration of card locations.

After the **dact-slk** command is entered, verify the cancellation by issuing the **rept-stat-slk** command.

Output

```
dact-slk:loc=1301:link=a
rlghncxa03w 04-01-07 11:11:28 EST EAGLE5 33.0.0
Deactivate Link message sent to card
;
```

dact-user

Deactivate User

Use this command to end a user session. The **logout** command has the same affect as the **dact-user** command.

Keyword: dact-user

Related Commands: act-user, chg-pid, chg-user, dlt-user, ent-user, login, logout, rept-stat-user, rtrv-secu-user, rtrv-user

Command Class: Basic

Parameters

This command has no parameters.

Example

```
dact-user
```

Dependencies

None

Notes

The **logout** or **canc-user** commands can be used in place of **dact-user**.

Output

Not applicable.

disc-imt

Disconnect IMT

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. Use this command to disconnect a card from the specified IMT bus.

NOTE: When a card is disconnected from the IMT Bus, it may take several seconds for the card IMT Status to be updated. If an init-mux or disc-imt command is entered for the alternate IMT Bus before the card IMT Status is updated, then the card may reboot. After disconnecting the card from the IMT bus, use the rept-stat-imt or rept-stat-card command to determine

whether the card IMT status is updated. Do not issue the `disc-imt` or `init-mux` command for the alternate IMT bus until the card status is updated.

Keyword: `disc-imt`

Related Commands: `clr-imt-stats`, `conn-imt`, `rept-imt-lvl1`, `rept-imt-lvl2`, `rept-stat-imt`, `rmv-imt`, `rst-imt`

Command Class: System Maintenance

Parameters

:bus= (mandatory)

IMT bus to be disconnected from.

Range: a, b

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

```
disc-imt:loc=1213:bus=b
```

Dependencies

This command cannot be entered during an IMT Fault Isolation Test. The card cannot be isolated from both IMT busses.

The card location, frame, shelf, or slot must be within the allowed range.

This command cannot be entered if an IMT Rate Change sequence is in progress.

This command cannot be entered during an IMT Fault Isolation Test or an Extended Bit Error Rate Test (BERT).

Notes

The card can be reconnected by issuing the `conn-imt` command, or by re-inserting the card. A software reset does not affect connect status. (The `init-card` command performs a software reset.)

Output

```
disc-imt:loc=1213:bus=b
```

```
rlghncxa03w 04-01-07 11:02:30 EST EAGLE 31.3.0
Disconnect IMT Bus B command issued to card 1213

disp-fta-dir

Display Contents of the File Transfer Area

Use this command to display the files that are in the file transfer area (FTA) the layout of FTA, and the amount of free space in the FTA.

Keyword: `disp-fta-dir`

Related Commands: `act-file-trns`, `copy-fta`, `dlt-fta`

Command Class: System Maintenance

Parameters

:loc= (optional)
 The location of the fixed disk whose FTA is to be displayed.
Range: **1114, 1116**
 (TDMs)
Default: The active TDM location

Example

```
disp-fta-dir:loc=1114
```

Dependencies

This command must display the files (along with deleted files and free slots) in the order in which they appear in the file transfer area.

The **loc** parameter must specify a TDM card.

Only one file transfer can be active at a time.

TDM and E5-TDM cards cannot co-exist in the system.

Notes

None

Output

```
disp-fta-dir:loc=1114
rlghncxa03w 05-07-01 16:21:12 EST EAGLE 31.3.0
File Transfer Area Directory of fixed disk 1114:

dlt-acg-mic**Delete ACG Manually Initiated Control**

Use this command to delete ACG controls that apply to certain queries. The control can apply to all queries or to specific query services and called party digits. A particular control is selected to be deleted by either specifying that it is the **type=all** control or specifying its service and digits.

Keyword: **dlt-acg-mic**

Related Commands: **chg-acg-mic, ent-acg-mic, rept-stat-lnp, rtrv-acg-mic**

Command Class: Database Administration

Parameters

:dgts= (optional)
 Digits
Range: 3-10 digits

:serv= (optional)
 Query service
Range: **ain, in**

:type= (optional)
 Type of control
Range: all, sd
Default: sd

Example

```
dlt-acg-mic:type=all
dlt-acg-mic:serv=ain:dgts=9194602132
```

Dependencies

If the **type=all** parameter is specified, then the **serv** and **dgts** parameters cannot be specified.

If the **type=sd** parameter is specified, then the **srv** and **dgts** parameters must be specified.

If the **type=all** parameter is specified, a MIC with **type=all** must exist.

If the **type=sd** parameter is specified, a MIC with the same service and digits must exist.

The LNP feature must be turned on before this command can be entered.

The **dgts** parameter value must be 3 digits or 6-10 digits in length.

Notes

None

Output

```
dlt-acg-mic:type=all

rlghncxa03w 04-02-28 08:50:12 EST EAGLE 31.3.0
ACG MIC table is (10 of 256) 4% full of type SD

```

dlt-acg-noc

Delete ACG Node Overload Control

Use this command to delete the definition of a node overload level. The definition is comprised of the threshold LNP query rates for node overload levels and the values for the Automatic Call Gappings (ACG) to be sent when at the level. If a level is not defined, it is not used. Level 10 cannot be deleted.

Keyword: dlt-acg-noc

Related Commands: chg-acg-noc, ent-acg-noc, rept-stat-lnp, rtrv-acg-noc

Command Class: Database Administration

Parameters

:lvl= (mandatory)
 Overload level.
Range: 1-9

Example

```
dlt-acg-noc:lvl=3
```

Dependencies

The specified overload level must be defined.

The LNP feature must be turned on before this command can be entered.

Notes

None

Output

```
dlt-acg-noc:lv1=3

rlghncxa03w 04-02-28 08:50:12 EST EAGLE 31.3.0
DLT-ACG-NOC: MASP A - COMPLTD
;
```

dlt-appl-rtkey**Delete Application Route Key Table**

Use this command to delete static entries from the Routing Key table. These entries are used to associate a routing key with a socket name. A static entry is created using the **ent-appl-rtkey** command.

There are three types of routing keys, as follows:

- DPC, SI, SSN routing keys, which are used to route SCCP messages
- DPC, SI routing keys, which are used to route non-SCCP and non-ISUP messages
- DPC, SI, CIC routing keys, which are used to route ISUP messages

Keyword: dlt-appl-rtkey

Related Commands: ent-appl-rtkey, rtrv-appl-rtkey

Command Class: Database Administration

Parameters

NOTE: See "**Point Code Formats and Conversion**" for a detailed description of point code formats, rules for specification, and examples.

:asname= (optional)

Application Server (AS) name; AS assigned to this routing key.

Range: *aaaaaaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter

:cice= (optional)

The end range of circuit identification codes assigned to the routing key. Specify **cice** along with **cics** to identify the routing key to be changed. Valid only if **si=4, 5, or 13** and required if **si=4, 5, or 13**.

Range: **0-4294967295**

See Table A-4 for valid CIC values for specified SI and MSU types.

:cics= (optional)

The end range of circuit identification codes assigned to the routing key. Specify **cice** along with **cics** to identify the routing key to be changed. Valid only if **si=4, 5, or 13** and required if **si=4, 5, or 13**.

Range: **0-4294967295**

See Table A-4 for valid CIC values for specified SI and MSU types.

:dpc= (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: dpca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Destination point code.

:dpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:dpcn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:opc= (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **opca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:opc/opca/opci/opcn/opcn24= (optional)

Originating point code. Valid only if **si=4, 5, or 13** and required if **si=4, 5, or 13**.

:opci= (optional)

ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:opcn= (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:opcn24= (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—000–255

sp—000–255

:rcontext= (optional)

Identify a routing key by its routing context when a routing key needs to be deleted as an optional alternative to entering the **dpc/si/ssn/opc/cics/cice/type** key parameters.

Range: 0-4294967295

:si= (optional)

Service indicator.

Range: 0-15

0-15 or equivalent text values:

Number = Text—Description

0 = **snm**—Signaling network management messages

1 = **regtest**—Signaling network testing and maintenance regular

2 = **spltest**—Signaling network testing and maintenance special

3 = **sccp**—SCCP

4 = **tup**—Telephone user part

5 = **isup**—ISDN user part

13 = **qbicc**

:ssn= (optional)

Subsystem number.

Range: 0-255

:type= (optional)

Type of routing key that is being changed.

Range: full, partial, default

Default: full

Example

```
dlt-appl-rtkey:dpc=1-1-1:si=3:aname=as1:ssn=255
```

```
dlt-appl-
```

```
rtkey:dpci=s-3-11-1:si=5:opci=s-4-11-2:cics=1:cice=1000:aname=as  
itu
```

```
dlt-appl-rtkey:rcontext=100
```

Dependencies

The SSN is valid and must be specified only when the **si=3** (or **sccp**) parameter is specified. When the **si=3** (or **sccp**) parameter is not specified, the **ssn** parameter must not be specified.

The value entered for the starting circuit identification code (**cics**) must be less than or equal to the value entered for the ending circuit identification code (**cice**).

A circuit identification code range (**cics** to **cice**) that overlaps an existing routing key cannot be specified.

When the DPC is ANSI and the **si=4** parameter is specified, a DPC/SI routing key must be specified (TUP is used only in an ITU network).

The **opc**, **cics**, and **cice** parameters are required and can be entered only if the **si** parameter value is **4**, **5**, or **13**.

If the **si=4**, **5**, or **13** (or **tup**, **isup**) parameter is specified, or the **qbicc** parameter is specified, a value must also be specified for the **opc**, **cics**, and **cice** parameters used to route ISUP messages. The **opc**, **cics**, and **cice** parameters can be specified only if the **si=4**, **5**, or **13** (or **tup**, **isup**) parameter is specified, or if the **qbicc** parameter is specified.

Table A-4 shows valid CIC values for SI types 4, 5, and 13.

The routing key must be in the Routing Key table.

If the **aname** parameter is specified, the AS name must already be defined in the AS table. The AS name and parameters specified for a routing key must use an address format that is valid for the adapter type used by the ASP associations assigned to the AS.

When the **type=full** parameter is specified, the **dpc** and **si** parameters must be specified.

The following types of partial routing keys are supported:

- DPC-SI-OPC (ignore CIC) can be used as a partial match key for CIC- based traffic.
- DPC-SI (ignore all other fields) can be used as a partial match key for CIC- based traffic or SCCP traffic.
- DPC only (ignore all other fields) can be used as a partial match for any type of traffic.
- SI only (ignore all other fields) can be used as a partial match for any type of traffic.

The following card locations are not valid for this command: 1113, 1115, 1117, 1118, and all xy09 and xy10 locations (where x is the frame and y is the shelf). The card must be equipped and in service.

If the **type=default** parameter is specified, then the **dpc**, **si**, **ssn**, **opc**, **cice**, and **cics** parameters cannot be specified.

The **aname** or the **rcontext** parameter must be specified in the command.

Notes

A specific routing key/socket name association can be deleted by specifying a fully qualified routing key (**dpc/dpca**, **si**, **ssn**, and **a sname**). By default, socket associations in the static key entries are deleted using the **dlt-appl-rtkey** command.

The originating point code (**opc**) and destination point code (**dpc**) must not specify a cluster route.

Group codes are required for ITU-N point codes (DPCN/OPCN) when the Duplicate Point Code feature is turned on.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

Output

```
dlt-appl-rtkey:aname=tekelec:si=3:ssn=255:type=full:dpc=2-2-2
rlghncxa03w 08-03-17 15:35:05 EST EAGLE 38.0.0

;
```

dlt-as

Delete Application Server

Use this command to delete an AS.

Keyword: dlt-as

Related Commands: chg-as, ent-as, rept-stat-as, rtrv-as

Command Class: Database Administration

Parameters

:aname= (mandatory)

Name of the M3UA/SUA SCTP association to be deleted.

Range: ayyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter.

:asname= (mandatory)

Application Server assigned to the routing key.

Range: *ayyyyyyyyyyyyyyy*

Up to 15 alphanumeric characters; the first character must be a letter

Example

```
dlt-as:as=asx:aname=asxp1
```

Dependencies

An AS that is still assigned to a routing key cannot be deleted.

The connection state for the associations assigned to the AS must be **open=no** before the AS can be deleted.

The AS must be defined in the AS table.

The specified associaton name (**aname**) parameter must be defined in the AS.

Notes

None

Output

```
dlt-as:as=asx:as=asxp1
```

```
rlghncxa03w 04-02-17 15:35:05 EST EAGLE 31.3.0
DLT-AS: MASP A - COMPLTD
```

```
;
```

dlt-assoc

Delete Association

Use this command to delete the SCTP associations from the IPAPSOCK table.

Keyword: **dlt-assoc**

Related Commands: **chg-assoc**, **ent-assoc**, **rtvr-assoc**

Command Class: Database Administration

Parameters

:aname= (mandatory)

Name assigned to the association to be deleted.

Range: *ayyyyyyyyyyyyyyy*

Up to 15 alphanumeric characters; the first character must be a letter

Example

```
dlt-assoc:aname=tekelec
```

Dependencies

The association name (**aname**) must already exist in the IP Socket/Association (IPAPSOCK) table.

An association that exists on any AS cannot be deleted from the IPAPSOCK table.

An AS assigned to a routing key cannot be deleted from the IPAPSOCK table.

The connection state must be **open=no** to delete the association from the IPAPSOCK table.

If the association on an IPSG card is referenced by a signaling link, then the association cannot be deleted.

Notes

None.

Output

```
dlt-assoc:aname=tekelec

rlghncxa03w 04-02-17 15:35:05 EST EAGLE 31.3.0
DLT-ASSOC: MASP A - COMPLTD
;
```

dlt-card**Delete Card**

Use this command to remove a card entry from the system database.

Keyword: dlt-card

Related Commands: init-card, rept-stat-card, rmv-card, rst-card, rtrv-card

Command Class: Database Administration

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

```
dlt-card:loc=1201
```

Dependencies

The card location slot must be between **1** and **16**, but not **9** or **10**.

The card location cannot be **1113–1118**.

The shelf location must be **11xx**, **12xx**, **13xx**, **21xx**, **22xx**, **23xx**, **31xx**, **32xx**, **33xx**, **41xx**, **42xx**, **43xx**, **51xx**, **52xx**, **53xx**, or **61xx**.

The shelf and card must be equipped.

Before this command can be entered, all TCP/IP data links assigned to the card must be deleted.

Before an E1 card or an E1/T1 MIM card used as an E1 card can be deleted, any E1 interfaces assigned to the card must be deleted

Before an E1/T1 MIM card that is used as a T1 card can be deleted, any T1 interfaces assigned to the card must be deleted.

After the links are deleted, the card must be inhibited before it can be deleted. Use the **inh-card** command to set the card to the OOS-MT-DSBLD state.

Before this command can be entered, SS7 signaling links assigned to the card must be deleted.

Only one database change, action, backup, or restore can be in progress at a time.

Notes

If a SEAS terminal is configured for a location, then entering the **dlt-card** command causes the warning “Invalidating the Terminal data in SEASCFG table” to appear.

Output

```

dlt-card:loc=1201
  rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0
  DLT-CARD: MASP A - COMPLTD
;

```

dlt-csl**Delete Common Screening List**

Use this command to delete an existing entry from the Common Screening List (CSL). The Common Screening List commands are used to tailor certain types of general screening information to specific features.

Keyword: dlt-csl

Related Commands: chg-csl, ent-csl, rtrv-csl, rtrv-ctrl-feat

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

NOTE: Either the **ds** parameter or the **pc** parameter must be specified in the command. Both parameters cannot be specified in the same command.

:ds= (optional)

Digit string. This parameter specifies a unique string of digits that is used by the specified screening feature.

Range: 1-15 digits
1 - 15 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.

- 1-6 digits—Prepaid IDP Query Relay **ccnc** list
- 1-15 digits—Prepaid IDP Query Relay **gt** list
- 1-10 digits—Prepaid IDP Query Relay **skbcsm** list
- 4 digits—IDP Screening for Prepaid **skts** list
- 1-15 digits—IDP Screening for Prepaid **insl** list
- 1-15 digits—VFLEX **vmplx** list
- 1-6 digits—Info Analyzed Relay Base **ccnc** list
- 1-15 digits—Info Analyzed Relay Base **gt** list
- 2 digits—Info Analyzed Relay Base **trig** list

Table 5-22 lists valid hexadecimal values for the Info Analyzed Relay Base **trig** list **ds** entries.

:feature= (optional)

Feature name. This parameter specifies the name of the enabled screening feature for which the command is entered.

Either the **pn** parameter or the **feature** parameter must be specified to identify the feature.

Range: *a*
1 alphabetic character followed by up to 24 optional alphanumeric characters, including spaces and special characters, enclosed in double quotation marks (" ").

Enter enough of the feature name to make the name unique if two features begin with the same word or acronym. The following feature names are valid for this command:

- IDP Screening for Prepaid
- Info Analyzed Relay Base
- Prepaid IDP Query Relay
- IDP Service Key Routing
- VFLEX

:list= (optional)

Name of the Common Screening List associated with the feature.

This parameter must be specified when the feature uses more than one type of Common Screening List.

Range: **gt, skbcm, ccnc, insl, skts, vmpfx, trig, delpfx**

gt— Global Title List

skbcm— SK+BCSM List

ccnc— CC+NC List

insl— In Network Subscriber List

skts— Service Key + Teleservice List

vmpfx— Voice Mail Prefix List

trig— Trigger List

delpfx— Delete Prefix List

The following screening lists are valid for the indicated features:

- **insl, skts**—IDP Screening for Prepaid
- **ccnc, gt**—Prepaid IDP Query Relay and Info Analyzed Relay Base
- **skbcm**—Prepaid IDP Query Relay and IDP Service Key Routing
- **vmpfx**—VFLEX
- **trig**—Info Analyzed Relay Base

The **delpfx** list is not supported at this time. This list should only be used by Tekelec personnel.

:pc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **pca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (optional)

Point code. Either the **ds** parameter or a point code parameter must be specified.

:pci= (optional)

ITU international point code with subfields *zone-area-id*.

Range: **0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The point code **0-000-0** is not a valid point code.

zone—**0-7**

area—**000-255**

id—**0-7**

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:pn= (optional)

Part Number. The 9-digit "893xxxxxx" part number of the feature for which the command is entered. The **rtrv-ctrl-feat** command description shows the part number in the command output example. Either the **pn** parameter or the **feature** parameter must be specified to identify the feature.

Range: **893000000-893999999**

The first 3 digits are **893**. Do not separate the digits with dashes or spaces. The following part numbers are valid for this command:

- **893015501**—IDP Screening for Prepaid
- **893016001**—Prepaid IDP Query Relay
- **893034201**—Info Analyzed Relay Base
- **893016701**—VFLEX

Example

```
dlt-csl:feature="IDP Screening for Prepaid":list=ins1:ds=246810
```

```
dlt-csl:pn=893015501:list=skts:ds=36ab
```

```
dlt-csl:feature="VFLEX":list=vmpfx:ds=123456789abcdEF
```

Dependencies

An enabled feature must be specified using either a valid part number (**pn**) or feature name (**feature**). The specified feature must use a Common Screening List.

The value specified for the feature parameter must be a valid feature name for a feature that uses a Common Screening List. The feature name must be specified as it appears in the **rtrv-ctrl-feat** command output. Enough of the name must be specified to make the name unique when two features begin with the same word or acronym.

The feature that is specified in the **feature** parameter must be enabled.

The **list** parameter must be specified for features that use more than one type of screening list.

The value specified for the **list** parameter must be valid for the specified screening feature.

The specified screening list entry must exist in the screening list that is used by the feature.

The following parameters are allowed with the indicated common screening list type:

- **list=gt—ds** parameter
- **list=ccnc—ds** parameter
- **list=skbcm—ds** parameter
- **list=skts—ds** parameter
- **list=insl—ds** parameter
- **list=vmpfx—ds** parameter
- **list=trig—ds** parameter

The **pc** and **ds** parameters cannot be specified together in the command.

Notes

None

Output

```
dlt-csl:pn=893015501:list=insl:ds=123456789abcdEF
tekelecstp 05-08-21 15:18:41 EST EAGLE 34.3.0
INSL List table is (5 of 50) 10% full

;
```

dlt-cspc

Delete Concerned Signaling Point Code

Use this command to remove a CSPC or an entire CSPC group.

Keyword: dlt-cspc

Related Commands: ent-cspc, rtrv-cspc

Command Class: Database Administration

Parameters

One, but not both, of these optional parameters must be specified: **all**, **pc/pca/pci/pcn/pcn24**.

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:grp= (mandatory)

Group name

Range: *ayyyyyyy*

1 alphabetic character followed by up to 7 alphanumeric characters

:all= (optional)

Use this parameter to confirm that all entries for this concerned signaling point code group are to be removed.

Range: **yes, no**

Default: **no**

:pc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **pca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (optional)

Concerned signaling point code.

:pci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

n1-n2-n3-n4—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Example

```
dlt-cspc:grp=grp01:pc=144-201-001
```

```
dlt-cspc:grp=grp01:pci=s-144-201-001
```

```
dlt-cspc:grp=grp01:all=yes
```

Dependencies

A CPC group name must be specified. The specified group name must exist in the database.

The **grp** parameter and the **all=yes** parameter must be entered with no point code parameter, to remove a group and all of its point codes.

If a PC is specified, then the PC network type must match the group network type, and the PC must exist in the specified CPC group. The specified PC is removed from the CPC group.

Either a PC parameter or the **all=yes** parameter must be specified.

The Spare Point Code Support feature must be enabled before the spare PC prefix **s-** can be specified for an ITU-I or ITU-N point code.

A PC parameter cannot be entered together with the **all** parameter in the same command.

The specified CSPC group must not be referred to by any Mate Application entity.

If the Flexible GTT Load Sharing feature is not enabled, a CAUTION is displayed. When the feature is enabled, the command is rejected with message E4534.

Notes

The system issues a warning if a mate application entity could potentially use a group name that is being deleted.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

Output

```
dlt-cspc:grp=grp01:pci=2-2-2
```

```
tekelecstp 04-04-08 12:42:47 EST EAGLE 31.3.0
```

```
DLT-CSPC: MASP A - COMPLTD
```

```
;
```

dlt-dlk**Delete Data Link**

Use this command to remove a TCP/IP data link from the database. The TCP/IP data link is used for the STP LAN feature, connecting the system to a remote host for message processing.

Keyword: dlt-dlk

Related Commands: act-dlk, canc-dlk, ent-dlk, rept-stat-dlk, rtrv-dlk, tst-dlk

Command Class: Database Administration

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

```
dlt-dlk:loc=1201
```

Dependencies

The ACM is the only card type that is valid for this command.

The shelf and card must be equipped.

The specified ACM must have a TCP/IP data link assigned to it.

The specified ACM and data link must be out-of-service maintenance-disabled (OOS-MT-DSBLD).

Enter the **rept-stat-card** and **rept-stat-dlk** commands to verify the state of the ACM and data link.

Notes

None

Output

```
dlt-dlk:loc=1201
```

```
rlghncxa03w 04-02-10 11:43:02 EST EAGLE 31.3.0
DLT-DLK: MASP A - COMPLTD
```

```
;
```

dlt-dstn**Delete Destination**

Use this command to delete destinations from the Destination entity set after the STP no longer routes to those destinations.

Keyword: dlt-dstn

Related Commands: chg-dstn, chg-rte, dlt-rte, ent-dstn, ent-rte, rept-stat-dstn, rept-stat-rte, rtrv-dstn, rtrv-rte

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:dpc= (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: dpca

Range: p-, 000-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

The asterisk value (*) is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (mandatory)

Destination point code.

:dpci= (mandatory)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (mandatory)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code (*gc*) must be specified when the ITUDUPPC feature is turned on. The *prefix* indicates a spare point code, private point code, or private and spare point code.

Range: s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (mandatory)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code.

Range: **p-, 000-255**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—**p-**
msa—**000-255**
ssa—**000-255**
sp—**000-255**

Example

To delete destination 11-222-111:

dlt-dstn:dpc=111-222-111

To delete a network destination:

dlt-dstn:dpc=21-*-*

To delete destination 8112-ge:

dlt-dstn:dpcn=8112-ge

To delete ITU-N 24-bit destination 13-100-10:

dlt-dstn:dpcn24=13-100-10

To delete destination spare point code s-8112:

dlt-dstn:dpcn=s-8112

Dependencies

The destination address must be either a full point code, a cluster point code, or a network destination point code.

The format of the specified **dpcn** parameter must match the format for ITU national point codes that was assigned with the **chg-stpopts:npfcmfi** parameter.

The specified destination point code must already exist in the Destination entity set.

The destination cannot have routes assigned to it.

The specified destination point code cannot already be defined as a remote application internal point code (IPC).

The **dpc** parameter must be defined as a destination point code.

The specified destination point code cannot already be defined as an adjacent point code or a secondary adjacent point code.

The specified destination cannot be referenced by SCCP as a destination point codes in the Mate Application table.

The specified destination cannot be referenced by SCCP as a destination point code in the Mated Relay Node (MRN) table.

Network routing is valid only if the Network Routing (NRT) feature is turned on.

When using network routing, if the destination point code has a value of * in the *nc* subfield, the *ncm* subfield must also be * (for example, **dpc=21-*.***).

A destination point code that is used as a proxy point code cannot be deleted.

If an exception route is associated with a cluster member, then the cluster member cannot be deleted.

Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

Output

The following example shows the display of the destination memory space accounting command completion response with the NCR, NRT, and CRMD features off (disabled) and all Routes and Routesets features off (disabled):

```
dlt-dstn:dpc=111-222-111

dlt-e1

Delete E1 Interface

Use this command to delete an interface for E1/T1 MIM cards or HC-MIM or E5-E1T1 cards used as E1 or SE-HSL cards.

NOTE: On an HC-MIM or E5-E1T1 card, E1 ports 1, 3, 5, and 7 (master ports) can be independently channel bridged with their adjacent even-numbered (slave) ports 2, 4, 6, and 8 to allow non-signaling data pass-through. The slave port interface is automatically deleted with the command that deletes its master port interface.

Keyword: dlt-e1

Related Commands: chg-e1, ent-e1, rtrv-e1, tst-e1

Command Class: Database Administration

Parameters

:e1port= (mandatory)

E1 port number.

Range: 1-8

Ports 3 - 8 can be specified only for HC MIM cards and E5-E1T1 cards.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

```
dlt-e1:loc=1205:e1port=1
```

Dependencies

The specified card location (**loc** parameter) must be equipped.

The card in the specified card location (**loc** parameter) must be a **lime1** card type.

The port specified by the **e1port** parameter must be already equipped with an E1 interface.

All signaling links providing timeslots serviced by the specified E1 interface must be deleted before the E1 interface can be deleted. See the **dlt-slk** command to delete the signaling links providing the timeslots.

A channel bridged slave (even-numbered) port on an HC-MIM or E5-E1T1 card cannot be specified in the **e1port** parameter. To delete channel bridged port interfaces, specify the master (odd-numbered) port in the **e1port** parameter. The slave port interface is automatically deleted when its master port interface is deleted.

Card locations 1113, 1114, 1115, 1116, 1117, 1118 (OAM, TDM, MDAL cards) cannot be specified as values for the **loc** parameter.

Notes

None.

Output

```
dlt-e1:loc=1205:e1port=1
```

```

dlt-frm-pwr

dlt-frm-pwr

Use this command to delete the existing power threshold entry from the Frame Power Threshold table for the specified frame. After the power threshold value is deleted, the default power threshold value of 30 Amps is assumed for the specified frame.

Keyword: **dlt-frm-pwr**

Related Commands: **chg-frm-pwr, ent-frm-pwr, rtrv-frm-pwr, rtrv-stp**

Command Class: Database Administration

Parameters

:frm= (mandatory)

Frame ID

Range: **cf00, ef00, ef01, ef02, ef03, ef04**

cf00 — Control frame

ef00 — First extension frame

ef01 — Second extension frame

ef02 — Third extension frame

ef03 — Fourth extension frame

ef04 — Fifth extension frame

Example

Delete the frame power threshold value for the third extension frame.

```
dlt-frm-pwr:frm=ef02
```

Dependencies

A power threshold value must already be provisioned for the specified frame.

Output

```

dlt-frm-pwr:frm=ef02
tekelecstp 06-04-11 16:07:11 EST EAGLE 35.0.0

FRAME POWER THRESHOLD table is (3 of 10) 30% full
DLT-FRM-PWR: MASP A - COMPLTD
;

```

dlt-fts**Delete Entry from the File Transfer Area**

This command removes a file from the file transfer area (FTA).

Keyword: **dlt-fts**

Related Commands: **act-file-trns, copy-fts, disp-disk-dir**

Command Class: System Maintenance

Parameters

NOTE: At least one of these parameters but not both, must be specified: all, file.

:all= (optional)

This parameter allows all files to be removed from the FTA.

Range: **yes, no**

Default: **no**

:file= (optional)

Name of the file to be removed.

Range: **////////////////////////////////////**

The name of the file with its extension.

:force= (optional)

This parameter is required to delete the last file in the FTA. In such cases, the value must be set to **force=yes**.

Range: **yes, no**

Default: **no**

:loc= (optional)

The card location of the fixed disk containing the FTA.

Range: **1114, 1116**
(TDM)

Default: The location of the active TDM

Example

```

dlt-fts:loc=1114:file="CAM.ELF"
dlt-fts:loc=1114:file="CAM.ELF":force=yes
dlt-fts:loc=1116:all=yes

```

Dependencies

Removing an individual file only frees up that file name for another transfer of that file.

The **all=yes** parameter must be specified when a specific filename is not supplied.

The **all=yes** parameter not only removes all files from the FTA, but frees up the space in the FTA.

When using DOS file names, if the file name contains a special character such as an underscore (_) or begins with a numeric, the file name must be in quotes (" "), for example, "92_name.ext".

Removing an individual file only frees up that file name for another transfer of that file.

The **force=yes** parameter must be specified to remove the last file in the FTA.

The **loc** parameter must specify a TDM card.

A specific filename and **all=yes** may not be specified at the same time.

Only one file transfer can be active at a time.

TDM and E5-TDM cards cannot be installed in the same system.

Notes

None

Output

```
dlt-ftp:file=oam.elf:loc=1114
rlghncxa03w 04-02-05 15:31:59 EST EAGLE 31.3.0
File OAM.ELF deleted from File Transfer Area on fixed disk 1114.
;
dlt-ftp:all=yes:loc=116
rlghncxa03w 04-02-05 15:33:32 EST EAGLE 31.3.0
All files deleted from File Transfer Area on fixed disk 1116.
;
```

dlt-ftp-serv

Delete FTP Server Entry

Use this command to delete an entry for an FTP server from the FTP Server table.

Keyword: **dlt-ftp-serv**

Related Commands: **chg-ftp-serv, ent-ftp-serv, rtrv-ftp-serv**

Command Class: Database Administration

Parameters

:app= (mandatory)

Application. This parameter specifies the FTP Client application at the EAGLE 5 ISS STP that interfaces with the FTP Server.

Range: **meas, user, db, dist**

meas — Measurements Platform application

user — FTP-based Table Retrieve Application (FTRA)

db — Database Backup/Restore application

dist — EAGLE 5 ISS Software Release distribution application

:ipaddr= (mandatory)

IP Address of the FTP Server.

Range: 4 numbers separated by dots, with each number in the range of **0-255**.

Example

```
dlt-ftp-serv:app=meas:ipaddr=1.255.0.102
```

Dependencies

Both the **app** and **ipaddr** parameters must be entered in the command to delete an FTP server.

An entry must already exist in the FTP Server table for this application at the specified IP address.

The **app** parameter must specify an application that uses the FTP Support feature.

The **ipaddr** parameter must specify a valid IP address for the FTP server.

Notes

None

Output

```

dlt-ftp-serv:app=meas:ipaddr=1.255.0.102

rlghncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0
FTP SERV table is (1 of 10) 10% full

```

dlt-gserv-data**Delete G-Port SRI Query for Prepaid Service Data**

Use this command to delete translation type, originating point code, or global title address data from the GSERV table. These values are used to determine whether a Send Routing Information (SRI) request should receive G-Port SRI Query for Prepaid Service or normal G-Port SRI service.

Keyword: dlt-gserv-data

Related Commands: ent-gserv-data, rtrv-gserv-data

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:gta= (optional)

Global title address. This parameter specifies a CgPA global title address.

Range: 1-21 digits

:opc= (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: opca

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.

The point code **000-000-000** is not a valid point code.

:opc/opca/opci/open/open24= (optional)

Originating point code. Use these parameters to specify message transfer part (MTP) originating point codes.

:opci= (optional)

ITU international originating point code with subfields *zone-area-id*.

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:opcn= (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:open24= (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:tt= (optional)

Translation type. This parameter specifies a called party (CdPA) translation type.

Range: **0-255**

Example

```
dlt-gserv-data:tt=26
```

```
dlt-gserv-data:opc=1-1-1
```

```
dlt-gserv-data:gta=9194605500
```

Dependencies

The specified translation type (**tt** parameter), originating point code (**opc/opca/opci/opcn/opcn24** parameter), or global title address (**gta** parameter) must exist in the GSERV table before this command can be entered.

The G-Port SRI Query for Prepaid feature must be enabled before this command can be entered.

The **tt**, **opc**, and **gta** parameters cannot be specified within the same command.

The G-Port feature must be enabled before this command can be entered.

Output

```
dlt-gserv-data:tt=26
mystp 06-07-20 09:04:21 EST EAGLE 35.2.0
DLT-GSERV-DATA: MASP A - CMPLTD
;
```

dlt-gsmmap-scrn

Delete GSM MAP Screening Entry

Use this command to delete the GSM Map Screening CgPA and CdPA entries that are used to filter out or allow SCCP messages containing Map Op-Codes, CGPA GTA+NPV+NAIV, CDPA GTA+NPV+NAIV, and forbidden parameters.

Keyword: dlt-gsmmap-scrn

Related Commands: chg-gsmmap-scrn, ent-gsmmap-scrn, rtrv-gsmmap-scrn

Command Class: Database Administration

Parameters

:cgsr= (mandatory)

CgPA Screening Reference.

Range: *ayyy*

1 alphabetic character followed by up to 3 optional alphanumeric characters

:opname= (mandatory)

Operation code name. This value references the operation code (**opcode**) defined with the **ent-gsms-
opcode** command.

Range: *ayyyyyyy*

Up to 8 alphanumeric characters

:cdsr= (optional)

CdPA Screening Reference.

Range: *ayyy*

1 alphabetic character followed by up to 3 optional alphanumeric characters

Example

```
dlt-gsmmap-scrn:opname=xyz:cgsr=fela:cdsr=fall
```

```
dlt-gsmmap-scrn:opname=xyz:cgsr=fela
```

Dependencies

The GSM Map Screening feature must be enabled before this command can be entered.

The Enhanced GSM Map Screening (EGMS) feature must be enabled before the **cdsr** parameter can be specified.

The specified **cgsr** parameter value must exist in the database.

The specified **cdsr** parameter value must exist in the database.

A **cgpa** entry cannot be deleted if it is referred to by **cdpa** entries.

The specified **opname** parameter value must exist in the GSM Map Op-Code table.

Notes

Unlike GTT (Global Title Translation) entries, the GSM MAP screening commands do not support splits of ranges during deletion or changes of entries.

Output

```

dlt-gsmmap-scrn:opname=xyz:cgsr=fela:cdsr=fall
rlghncxa03w 04-02-29 08:51:12 EST EAGLE 31.4.0
GSM Map Screening table is (1 of 4000) 1% full
DLT-GSM MAP-SCRN: MASP A - COMPLTD
;

```

dlt-gsms-opcode**Delete GSM MAP Screening Operation Code**

Use this command to delete GSM (Global System for Mobile Telecommunication) MAP (Mobile Application Part) screening operation codes and the default screening action for that operation code.

Keyword: **dlt-gsms-opcode**

Related Commands: **chg-gsms-opcode, ent-gsms-opcode, rtrv-gsms-opcode**

Command Class: Database Administration

Parameters

:opname= (mandatory)
Operation code name.
Range: *aaaaaaaa*
Up to 8 alphanumeric characters

Example

```
dlt-gsms-opcode:opname=ati
```

Dependencies

The reserved word **none** cannot be specified as a value for the **opname** parameter.

The value specified for the **opname** parameter must exist in the GSM MAP Op-Code table.

The **opname** value being deleted cannot be referenced in the GSM MAP Screening table.

The GSM Map Screening feature must be enabled before this command can be entered.

Notes

None

Output

```

dlt-gsms-opcode:opname=ati
rlghncxa03w 06-02-29 08:50:12 EST EAGLE 35.0.0
DLT-GSMS-OPCODE: MASP A - COMPLTD
;

```

dlt-gsmssn-scrn**Delete GSM Subsystem Number Screening Entry**

Use this command to delete an SSN (subsystem number) from the GSM (Global System for Mobile Telecommunication) SSN screening table.

Keyword: **dlt-gsmssn-scrn**

Related Commands: **ent-gsmssn-scrn, rtrv-gsmssn-scrn**

Command Class: Database Administration

Parameters

:ssn= (mandatory)
Subsystem number.

Range: 000-255

:type= (mandatory)

Subsystem type.

Range: **orig, dest**

orig— The origination SSN

dest— The destination SSN

Example

This example deletes a destination subsystem of 255 from the GSM SSN screening table:

```
dlt-gsmssn-scrn: ssn=255: type=dest
```

Dependencies

The GSM Map Screening feature must be enabled before this command can be entered.

A value for the **ssn/type** parameter combination must be specified that exists in the GSM SSN screening table.

Notes

None

Output

```
dlt-gsmssn-scrn: ssn=255: type=dest
```

```
rlghncxa03w 04-02-20 09:04:21 EST EAGLE 31.3.0
```

```
DLT-GSMSSN-SCRN: MASP A - COMPLTD
```

```
;
```

dlt-gta

Delete Global Title Address Information

Use this command to delete the GTA (global title address) information applicable to a global title selector combination.

This command deletes the routing of SCCP messages for specified global title addresses from designated destinations and their subsystem numbers.

NOTE: If the EGTT feature is turned on, then the GTT Selector (ent/chg/dlt/rtrv-gttset), GTT Set (ent/dlt/rtrv-gttset), and GTA (ent/chg/dlt/rtrv-gta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is on.

Keyword: dlt-gta

Related Commands: chg-gta, ent-gta, rtrv-gta

Command Class: Database Administration

Parameters

:gttsn= (mandatory)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

Range: ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

:acn= (optional)

Application context name. This parameter specifies the ITU TCAP *acn* field in the incoming MSU.

Range: 0-255 *, none

The **acn** parameter supports up to 7 subfields separated by a dash (e.g. *1-202-33-104-54-26-007*).

*—any valid value in the ITU TCAP *acn* field in the incoming MSU

none—there is no value in the ITU TCAP *acn* field in the incoming MSU

:cdssn= (optional)

Starting CdPA subsystem number.

Range: 0-255

:cgpc= (optional)

ANSI CgPA point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: cgpa

Range: 000-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

When **chg-sid:pctype=ansi** is specified, *ni*-*-* is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

:cgpci= (optional)

ITU international CgPA point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

:cgpcn= (optional)

ITU national CgPA point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:cgpcn24= (optional)

24-bit ITU national CgPA point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:cgssn= (optional)

Starting CgPA subsystem number.

Range: **0-255**

:dpc= (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **dpca**

Range: **000-255, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni-*-** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Point Code.

:dpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:dpcn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:ecdssn= (optional)

Ending CdPA subsystem number.

Range: 0-255

:ecgssn= (optional)

Ending CgPA subsystem number.

Range: 0-255

:egta= (optional)

End global title address. This parameter specifies the end of a range of global title digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

Default: Same as the specified **gta** value

:family= (optional)

This parameter specifies the ANSI TCAP *family* field in the incoming MSU.

Range: 0-255 *, none

*—any valid value in the ANSI TCAP *family* field in the incoming MSU

none—there is no value in the ANSI TCAP *family* field in the incoming MSU

:gta= (optional)

Global title address. This parameter specifies the beginning of a range of global title digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

:opc= (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: opca

Range: 000-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-*-* is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:opci= (optional)

ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:opcn= (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:open24= (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:opcode= (optional)

This parameter specifies the TCAP *opcode* field in the incoming MSU.

Range: **0-255 *, none**

*—any valid value in the TCAP *opcode* field in the incoming MSU

none—there is no value in the TCAP *opcode* field in the incoming MSU

:pkgtype= (optional)

Package type. This parameter specifies the ANSI TCAP and ITU TCAP package type.

Range: **ansiuni, qwp, qwop, cwp, cwop, any, bgn, cnt, ansiabort, end, ituabort, ituuni, resp**

ansiuni— ANSI unidirectional

qwp— Query with Permission

qwop— Query without Permission

cwp— Conversation with Permission

cwop— Conversation without Permission

any— Wildcard value

bgn— Begin

cnt— Continue

ansiabort— ANSI abort

end— End

ituabort— ITU abort

ituuni— ITU unidirectional

resp— Response

ANSI TCAP PKGTYPE—**ansiuni, qwp, qwop, resp, cwp, cwop, ansiabort, any**

ITU TCAP PKGTYPE—**bgn, ituabort, ituuni, any, end, cnt**

Example

dlt-

gta:gttsn=setcdgta:gta=123456789012345678901:egta=223456789012345678901

dlt-gta:gttsn=t800:gta=919461:egta=919468

dlt-

gta:gttsn=setcggta:gta=323456789012345678901:egta=423456789012345678901

dlt-gta:gttsn=setcgpc:cgpc=001-001-001

dlt-gta:gttsn=setopc:opca=002-001-001

dlt-gta:gttsn=setcgssn:cgssn=100:ecgssn=200

The following example specifies hexadecimal digits for the gta and egta parameters.

dlt-gta:gttsn=set1:gta=abcd:egta=abce

The following examples specify the GTA translations when the FLOBR feature is on.

dlt-gta:gttsn=setcdssn:cdssn=100:ecdssn=150

dlt-gta:gttsn=setdpc:dpci=1-101-1

Dependencies

The EGTT feature must be turned on before this command can be entered.

The **gttsn** parameter must be specified, may not have a value of **none**, and must match an existing **gttsn**.

The length of the specified **gta** parameter must match the number of digits provisioned for the specified GTT set when the VGTT feature is turned off. If the VGTT feature is turned on, then up to 10 GTA lengths can exist per GTT set. If the Support for 16 GTT Lengths in VGTT feature is turned on, then up to 16 GTA lengths can exist per GTT set.

The specified **gta/egta** range must exist for the specified GTT set in the STP active database. While an exact match is not required, you cannot specify an overlap with another range. If the range overlaps, an error is generated that displays a list of overlapped global title addresses. An example follows that shows what happens when the user attempts to enter a global title address range (such as 8005550000

to 800555999) that overlaps an existing range. The overlapping links must match. If they do not, the error message displays the list of overlapped global title addresses:

The following GTA ranges overlap the input GTA range

```
START GTA          END GTA
8005550000        8005551999
8005552000        8005553999
8005554000        8005555999
DLT-GTA: MASP A - Command Aborted
```

If the **egta** parameter is specified, the **gta** and **egta** value must be the same length and the **egta** value must be greater than the **gta** value.

The GTT table cannot be full in case a delete command causes a split requiring more entries to be added.

The **cgpc/cgpcac/cgpci/cgpcn/cgpcn24**, **opc/opca/opci/opcn/opcn24**, **cgssn**, **gta**, **cdssn**, **opcode/acn/pkgtype**, **opcode/family/pkgtype**, or **dpc/dpca/dpci/dpcn/dpcn24** parameter must be specified.

If specified, the **ecgssn/ecdssn** parameter must be greater than the **cgssn/cdssn** parameter.

The Origin-based SCCP Routing feature must be enabled when specifying the **cgpc/cgpcac/cgpci/cgpcn/cgpcn24**, **opc/opca/opci/opcn/opcn24**, or **(e)cgssn** parameters.

The **gta** parameter must be specified if the GTTSN set type has a value of **cdgta** or **cgta**, and cannot be specified for other set types.

The **cgpc/cgpcac/cgpci/cgpcn/cgpcn24** parameter must be specified if the GTTSN set type has a value of **cgpc**, and cannot be specified for other set types.

The **opc/opca/opci/opcn/opcn24** parameter must be specified if the GTTSN set type has a value of **opc**, and cannot be specified for other set types.

The **cgssn** parameter must be specified if the GTTSN set type has a value of **cgssn**, and cannot be specified for other set types.

If the specified GTT Set is an ANSI set, then the **cgpc/cgpcac**, **opc/opca**, and **dpc/dpca** parameters must be valid ANSI point codes. If the specified GTT Set is an ITU set, then the **cgpci/cgpcn/cgpcn24**, **opci/opcn/opcn24**, and **dpci/dpcn/dpcn24** parameters must be valid ITU point codes.

The range specified by the **cgssn/ecgssn** and **cdssn/ecdssn** parameters must exist for the specified GTT set.

The translation entry associated with the specified point code (**dpc/dpca/dpci/dpcn/dpcn24**, **pc/pca/pci/pcn/pcn24**, or **opc/opca/opci/opcn/opcn24**) or **opcode** value must already exist.

The range specified by the **cgssn/ecgssn** and **cdssn/ecdssn** parameters cannot overlap an existing range for the specified GTT set.

The **cgpc**, **cgssn**, **gta**, **opc**, **cdssn**, and **opcode** parameters cannot be specified together in the command. If the **cgssn** and **cdssn** parameters are both specified in the same command (in any order), then only the value for the last of the two parameters specified is used during processing.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the **gta** or **egta** parameters.

If the specified GTT set has a set type of **opcode** (see the **ent-gttset** command), then the **opcode/acn/pkgtype** or **opcode/family/pkgtype** parameters must be specified. These parameters cannot be specified for GTT sets with other set types.

If the specified GTT set has a set type of **cdssn** (see the **ent-gttset** command), then the **cdssn** parameter must be specified. The **cdssn** parameter cannot be specified for GTT sets with other set types.

The value specified for the **gttsn** parameter must match the name of an existing GTT Set.

A TOBR quantity feature must be turned on before the **opcode**, **pkgtype**, **acn**, or **family** parameter can be specified.

The **opcode**, **pkgtype**, and **family** parameters must be specified together for ANSI TCAP translations. The **opcode**, **pkgtype**, and **acn** parameters must be specified together for ITU TCAP translations.

If the **cgssn** parameter is specified, then the **ecdssn** parameter cannot be specified. If the **cdssn** parameter is specified, then the **ecgssn** parameter cannot be specified.

If the **family** parameter is specified, then the **pkgtype** parameter must have a value of **ansiuni**, **qwp**, **qwop**, **resp**, **cwp**, **cwop**, **ansiabort** or **any**.

If the **acn** parameter is specified, then the **pkgtype** parameter must have a value of **bgn**, **ituabort**, **ituuni**, **any**, **end**, or **cnt**.

If the **pkgtype=ituabort** parameter is specified, then a value of **none** must be specified for the **acn** and **opcode** parameters. If the **pkgtype=ansiabort** parameter is specified, then a value of **none** must be specified for the **family** and **opcode** parameters.

If the GTT set specified by the **gttsn** parameter has a set type of **dpc** (see the **ent-gttset** command), then the **dpc\dpca\dpci\dpcn\dpcn24** parameter must be specified. If the set type has a value other than **dpc**, then the **dpc\dpca\dpci\dpcn\dpcn24** parameter cannot be specified.

The FLOBR feature must be turned on before the **cdssn**, **ecdssn**, or **dpc** parameter can be specified.

If the translation entry is referenced in GTT Action Path table, then the entry cannot be deleted.

The specified GTT set must have a set type of **opcode** (see the **ent-gttset** command) before the **opcode/acn/pkgtype** or **opcode/family/pkgtype** parameters can be specified. The specified GTT set must have a set type of **cdssn**, **cgssn**, **cdgta/cgta**, **opc**, or **cgpc** before the **cdssn**, **cgssn**, **gta**, **opc**, or **cgpc** parameter, respectively, can be specified.

The **acn** and **family** parameters cannot be specified together in the command.

If the **opc** or **dpc** parameter is specified, then the **(e)gta**, **(e)cgssn**, **(e)cdssn**, and **opcode** parameters cannot be specified.

Notes

If a GTT is being deleted or changed and the point code (**dpc** or **rte**) is not found in the route table (unless the point code is the STP's true point code), the following message is displayed in the terminal scroll area:

```
NOTICE: No DPC and/or RTE found for GTT being deleted or changed.
```

The above situation may occur for the following reasons:

A database was upgraded from a release prior to EAGLE 5 ISS Release 27.1 or IP⁷ Secure Gateway Release 3.0 when GTT entries were not linked to the route table and the deletion of the **dpc** was permitted. The GTT referenced a **dpc/rte** that was deleted, and the enforce reference counts between the GTT and route tables were not updated.

- A serious problem occurred in which the reference count rules were not enforced and a **dpc** and/or **rte** were deleted while being referenced by a GTT entry. This indicates a software error; notify the Customer Care Center at (888) FOR-TKLC.

Output

The following example specifies GTA translations when the FLOBR feature is on.

```
dlt-gta:gttsn=setcdssn:cdssn=100
    rlgncxa03w 10-03-10 09:04:21 EST EAGLE 42.0.0
    DLT-GTA: MASP A - CMLPTD
;
```

dlt-gtcnv**Delete Global Title Conversion**

Use this command to delete entries from the Default Global Title Conversion table. The particular entry to be deleted is identified by the direction in conjunction with the TTA or TTI, or with the TTI, NP, and NAI.

Keyword: **dlt-gtcnv**

Related Commands: **chg-gtcnv, ent-gtcnv, rtrv-gtcnv**

Command Class: Database Administration

Parameters

:dir= (mandatory)

Direction of conversion.

Range: **atoi, itoa, both**

atoi— ANSI to ITU conversion

itoa— ITU to ANSI conversion

both— Conversion in both directions

:nai= (optional)

Nature of Address Indicator. This parameter is mandatory when **gtixlat=24** is specified, and cannot be specified when **gtixlat=22** is specified.

Range: **0-63 ***

Default: No change to current value

:np= (optional)

Numbering Plan. This parameter is mandatory when **gtixlat=24** is specified, and cannot be specified when **gtixlat=22** is specified.

Range: **0-15 ***

Default: No change to current value

:tta= (optional)

ANSI translation type. This parameter is mandatory when **dir=atoi** or **dir=both** is specified.

Range: **0-255 ***

Default: No change to current value

:tti= (optional)

ITU translation type. This parameter is required when **dir=atoi** is specified.

Range: **0-255 ***

Default: No change to current value

Example

The following example deletes an ANSI-to-ITU entry using the TTA of 10 to identify the entry.

```
dlt-gtcnv:dir=atoi:tta=10
```

The following example deletes an ANSI-to-ITU entry using the TTA of 11 to identify the entry.

```
dlt-gtcnv:dir=atoi:tta=11
```

The following example deletes a ITU-to-ANSI entry using the TTI of 7, NAI of 8, and NP of 6 to identify the entry.

```
dlt-gtcnv:dir=ittoa:tti=7:nai=8:np=6
```

The following example deletes a BOTH (ANSI <-> ITU) entry using the TTI of 9 and TTA of 12 to identify the entry.

```
dlt-gtcnv:dir=both:tta=12:tti=9
```

The following example deletes a BOTH (ANSI <-> ITU) entry using the TTI of 7, NAI of 6, NP of 4, and TTA of 12 to identify the entry.

```
dlt-gtcnv:dir=both:tta=12:tti=7:np=4:nai=6
```

The following example deletes an ANSI-to-ITU default entry using the TTA of * to identify the entry.

```
dlt-gtcnv:dir=atoi:tta=*
```

The following example deletes an ITU-to-ANSI default entry using the TTI of *, NAI of * and NP of * to identify the entry.

```
dlt-gtcnv:dir=ittoa:tti=:nai=:np=*
```

Dependencies

The ANSI/ITU SCCP Conversion feature must be enabled before this command can be entered.

The specified **dir**, **tta**, **tti**, **np**, and **nai** parameter combination must already exist in the database.

If the **dir=atoi** parameter is specified, then the **tta** parameter must be specified.

If the **dir=atoi** parameter is specified, then the **tti**, **nai**, and **np** parameters cannot be specified.

If the **dir=ittoa** parameter is specified, then the **tti** parameter must be specified.

If the **dir=ittoa** parameter is specified, then a wildcard value (*) must be specified for the **tti**, **np**, and **nai** parameters.

If the **dir=both** parameter is specified, then the **tta** and **tti** parameters must be specified.

If the **dir=both** parameter is specified, then a wildcard value (*) cannot be specified for any of the other parameters.

If specified, the **nai** and **np** parameters must be specified together in the command.

If the **dir=ittoa** and **gtixlat=22** parameters are specified, then wildcard values (*) cannot be specified. The **dir=ittoa** and **gtixlat=24** parameters must be specified before wildcard values can be specified.

If the **dir=ittoa** parameter is specified, then the **tta** parameter cannot be specified.

Notes

To delete an ANSI-to-ITU entry, specify the direction (**dir**) and the TTA.

To delete an ITU-to-ANSI entry with a **gtixlat** of **22**, specify the direction (**dir**) and the TTI.

To delete an ITU-to-ANSI entry with a **gtixlat** of **24**, specify the direction (**dir**), TTI, NAI and NP.

To delete a BOTH (ANSI <-> ITU) entry with a **gtixlat** of **22**, specify the direction (**dir**), TTA and TTI.

To delete a BOTH (ANSI <-> ITU) entry with a **gtixlat** of **24**, specify the direction (**dir**), TTA, TTI, NP and NAI.

Output

```
dlt-gtcnv:dir=both:tta=12:tti=9
```

```
rlghncxa03w 03-03-18 08:50:12 EST EAGLE 31.3.0
DLT-GTCNV: MASP A - COMPLTD
```

```
;
```

dlt-gtmod

Delete GT Modification Data

Use this command to delete an existing GT Modification (GTMOD) entry. The GTMOD entry consists of a GTMOD ID and GTMOD specific data.

Keyword: dlt-gtmod

Related Commands: chg-gtmod, ent-gtmod, rtrv-gtmod

Command Class: Database Administration

Parameters

:gtmodid= (mandatory)

GT Modification Identifier.

Range: ayyyyyyyy

1 alphabetic character followed by 8 alphanumeric characters

Example

```
dlt-gtmod:gtmodid=set1
```

Dependencies

If the GTMOD identifier is referenced in the GTT or GTT Action tables, then the identifier cannot be deleted.

The value specified for the **gtmodid** parameter must already exist in the GTMOD table.

The **gtmodid=none** parameter cannot be specified.

Output

```
dlt-gtmodid:gtmodid=set1
tekelecstp 10-03-08 18:38:05 EST EAGLE 42.0.0

GTMOD table is (2 of 100000) 1% full

DLT-GTMOD: MASP A - COMPLTD
;
```

dlt-gtt

Delete Global Title Translation

Use this command to remove the routing of messages for specified global title addresses from designated destinations and their subsystem numbers.

NOTE: If the EGTT feature is turned on, then the GTT Selector (ent/chg/dlt/rtrv-gtt sel), GTT Set (ent/dlt/rtrv-gtt set), and GTA (ent/chg/dlt/rtrv-gta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is on.

Keyword: dlt-gtt

Related Commands: chg-gtt, ent-gtt, rtrv-gtt

Command Class: Database Administration

Parameters

:gta= (mandatory)

Global title start address. This parameter specifies the beginning of a range of global title digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

:egta= (optional)

Global title end address. This parameter specifies the end of a range of global title digits.

Range: 1-21 digits
 If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.
 If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: **egta** same as **gta**

:ttn= (optional)

Translation type name.

Range: *ayyyyyyy*

1 alphabetic character followed by up to 8 alphanumeric characters

Default: No translation name is given

:type/typea/typei/typen/typen24/typeis/typens= (optional)

Translation type. This parameter identifies the translation type and network type. This parameter is the decimal representation of the 1-byte field used in SS7.

The **type** and **typea** parameters specify an ANSI network.

The **typei** parameter specifies an ITU-international network.

The **typen** parameter specifies an ITU-national network.

The **typen24** parameter specifies a 24-bit ITU-national network.

The **typeis** parameter specifies an ITU-international spare network.

The **typens** parameter specifies an ITU-national spare network.

A translation type numeric value may be entered as ANSI type (**type** or **typea**) and as an ITU type (**typei/typen/typen24/typeis/typens**). However, they are separate entities.

The point code domain translation types for GTT are handled by the EAGLE 5 ISS protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I spare, ITU-N, ITU-N spare, and ITU-N24.

Range: **0-255**

Default: No translation type is specified

Example

```
dlt-gtt: type=252: ttn=lidb9: gta=408908: egta=408988
```

```
dlt-gtt: gta=919833: typen24=4
```

The following example specifies hexadecimal digits for the gta and egta parameters.

```
dlt-gtt: ttn=set1: gta=abcd123456789a: egta=abcE123456789F
```

```
dlt-gtt: gta=123456: typeis=5
```

```
dlt-gtt: gta=123456: typens=5
```

Dependencies

If translation type is specified, it must exist in the database.

If the **ttn** parameter is specified, the name must correspond to a translation type entry.

If both **ttn** and **type** are specified, **ttn** must correspond to the given translation type.

The **type** or **ttn** parameter must be specified.

The **gta** length must equal the number of digits specified by the translation type. If the VGTT (variable length GTT) feature is turned on, you can have up to 10 GTA lengths per translation type. When you enter the **ent-gtt** command to create entries, the software keeps track of the lengths and allows only

ten different lengths. The global title address specified for the translation type must then have the same number of digits as an existing GTA.

The global title address range as expressed by the **gta** and **egta** parameters must already exist in the global title translation.

The range, as specified by the **gta** and the **egta**, must be exactly the same as a current entry or be contained within an existing range in the GTT data for the specified translation type. If the range overlaps, an error is generated that displays a list of overlapped global title addresses. An example follows that shows what happens when the user attempts to delete a global title address range (such as 8005550000 to 8005559999) that overlaps an existing range. The overlapping links must match. If they do not, the error message displays the list of overlapped global title addresses:

```
The following GTA ranges overlap the input GTA range
START GTA          END GTA
8005550000         8005551999
8005552000         8005553999
8005554000         8005555999
DLT-GTT: MASP A - Command Aborted
```

If the address range as specified by the start and end global title addresses does not exactly match the existing range, the range is split. All addresses in the existing range that are outside of the specified range are used to create new ranges. The specified range is deleted.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the **gta** or **egta** parameters.

If the **egta** parameter is specified, the value must be greater than the value specified for the **gta** parameter.

The **tt** parameter cannot be specified with a value that has been defined as an alias for another translation type.

The length of the specified GTA must match the number of digits provisioned for the specified Translation Type or the Translation Type referenced by the specified Translation Type Name, unless the PVGTT or VGTT feature is on. In the case the PVGTT feature is on the length of the specified GTA and EGTA can be less than or equal to the number of digits provisioned for the corresponding TT. In the case the VGTT feature is on, up to 10 different lengths can be provisioned per TT.

The **gta** length is not defined for the specified translation type entity.

The GTT table cannot be full.

The GTT set associated with the translation type specified by the **ttn** parameter must have a set type of **cdgta** (see the **ent-gttset** command).

The network domain of the translation type specified by the **ttn** parameter cannot be CROSS (see the **ent-gttset** command).

The **ttn=none** parameter cannot be specified.

The **xlat=none** parameter cannot be specified.

If the translation entry is referenced in GTT Action Path table, then the entry cannot be deleted.

Notes

If the OBSR or FLOBR feature is turned on, then the **dlt-gtt** command can delete only translation entries that have been provisioned by GTA commands and that have a set type of CdGTA.

Output

```
dlt-gtt: type=252: ttn=1ldb9: gta=408908: egta=408988
  rlgncxa03w 04-01-07 11:43:07 EST EAGLE 31.3.0
  DLT-GTT: MASP A - COMPLTD
;
```

dlt-gttact**Delete a GTT Action entry**

Use this command to delete an existing Global Title Translations (GTT) Action entry.

Keyword: **dlt-gttact**

Related Commands: **chg-gttact, ent-gttact, rtrv-gttact**

Command Class: Database Administration

Parameters

:actid= (mandatory)

GTT Action ID. The Action ID associated with the GTT Action entry.

Range: *ayyyyyyy*

1 leading alphabetic character and up to 8 following alphanumeric characters

Example

```
dlt-gttact:actid=disc1
```

Dependencies

The specified Action ID must already exist in the database.

The Action ID specified by the **actid** parameter cannot be referenced by an Action Set or an action entry that is associated an action of **fwd**.

The Action ID specified by the **actid** parameter cannot be associated with an action of **none** or **fallback**.

Output

```
dlt-gttact:actid=disc1
tekelecstp 10-02-04 18:38:05 EST EAGLE 42.0.0
dlt-gttact:actid=disc1
Command entered at terminal #4.

GTT Action table is (1 of 2000) 1% full

DLT-GTTACT: MASP A - COMPLTD
;
```

dlt-gttapath**Delete a GTT Action Path Entry**

Use this command to delete a GTT Action Path entry. A GTT Action Path entry consists of pairs of "setname + value" for Opcode/CgGTA/CdGTA. Each of these "setname + value" pairs should already be defined in the GTT translation table.

Keyword: **dlt-gttapath**

Related Commands: **chg-gttapath, ent-gttapath, rtrv-gttapath**

Command Class: Database Administration

Parameters

:gttpn= (mandatory)

GTT Path name.

Range: *ayyyy*

1 leading alphabetic character and up to 4 following alphanumeric characters.

Example

```
dlt-gttapath:gttpn=path1
```

Dependencies

The GTT Action - DISCARD, GTT Action - FORWARD, or GTT Action - DUPLICATE feature must be enabled before this command can be entered.

The GTT path name specified by the **gttpn** parameter must already exist in the database.

The value specified for the **gttpn** parameter cannot be a reserved word.

Output

```
dlt-gttapath:gttpn=path1
tekelecstp 10-02-04 18:29:41 EST EAGLE 42.0.0
dlt-gttapath:gttpn=path1
Command entered at terminal #4.

GTT Action Path table is (2 of 10000) 1% full

DLT-GTTAPATH: MASP A - COMPLTD
;
```

dlt-gttaset**Delete a GTT Action Set.**

Use this command to delete an existing Global Title Translations (GTT) Action Set.

Keyword: dlt-gttaset

Related Commands: chg-gttaset, ent-gttaset, rtrv-gttaset

Command Class: Database Administration

Parameters

:actsn= (mandatory)

GTT Action Set Name.

Range: *ayyyyyyy*
1 leading alphabetic and up to 8 following alphanumeric characters.

Example

```
dlt-gttaset:actsn=asetdisc1
```

Dependencies

The specified GTT Action Set must already exist in the database.

The GTT Action entry cannot be referred by any translation entry.

The **actsn=none** parameter cannot be specified.

The EGTT feature must be turned on before this command can be entered.

Output

```
dlt-gttaset:actsn=asetdisc1
tekelecstp 10-02-04 18:38:05 EST EAGLE 42.0.0
dlt-gttaset:actsn=asetdisc1
Command entered at terminal #4.

GTT Action Set table is (1 of 20000) 1% full

DLT-GTTASET: MASP A - COMPLTD
;
```

dlt-gttset**Delete GTT Selectors**

Use this command to delete an applicable global title translation (GTT) selector.

NOTE: When the EGTT feature is turned on, the GTT Selector (ent/chg/dlt/rtrv-gttset), GTT Set (ent/dlt/rtrv-gttset), and GTA (ent/chg/dlt/rtrv-gta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is turned on.

Keyword: dlt-gttset

Related Commands: chg-gttset, ent-gttset, rtrv-gttset

Command Class: Database Administration

Parameters

NOTE: The nature of address indicator parameters (naiv or nai) can be specified using a mnemonic or an explicit value. Either the mnemonic or the explicit value can be specified; however, both values cannot be specified at the same time for the same parameter. Table A-7 shows the mapping between the naiv and the nai parameter values.

NOTE: The numbering plan parameters (npv or np) can be specified using a mnemonic or an explicit value. Either the mnemonic or explicit value can be specified; however, both values cannot be specified at the same time for the same parameter. Table A-8 shows the mapping between the npv and the np parameter values.

:gti/gtia/gtii/gtin/gtin24/gtiis/gtins= (mandatory)

Global title indicator.

For all EGTT selector commands, the domain is defined as **gti** and **gtia** (ANSI), **gtii** (ITU international), **gtin** (ITU national), **gtin24** (24-bit ITU national), **gtiis** (ITU international spare), and **gtins** (ITU national spare).

For the selector commands, **gti** and **gtia** are equivalent. GTT selectors can be provisioned for the same translation type (TT) with different ITU domains.

Range: 0, 2, 4

Supported value for ANSI: **gti=0, 2** and **gtia=0, 2**

Supported values for ITU: **gtii/ gtin/gtin24/gtiis/gtins=0, 2, 4**

:cgssn= (optional)

CgPA subsystem number.

Range: 0-255

:eaglegen= (optional)

This parameter specifies whether the selector is used by EAGLE 5 ISS generated messages.

Range: yes

yes — used by EAGLE 5 ISS generated messages

:lsn= (optional)

Linkset name.

Range: ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

:nai= (optional)

Nature of Address indicator.

Range: sub, rsvd, natl, intl, dflt

:naiv= (optional)

Nature of Address indicator value.

Range: 0-127

:np= (optional)

Numbering Plan.

Range: e164, generic, x121, f69, e210, e212, e214, private, dflt

:npv= (optional)
Numbering Plan value.
Range: 0-15

:selid= (optional)
Selector ID.
Range: 0-65534

:tt= (optional)
Translation type.
Range: 0-255

Example

```
dlt-gtttsel:gti=2:tt=10
dlt-gtttsel:gtin=4:tt=0:np=dflt:nai=dflt
dlt-gtttsel:gtia=2:tt=21:cgssn=20:selid=1:lsn=ls10
dlt-gtttsel:gtia=2:tt=2:eaglegen=yes
dlt-gtttsel:gti=0:selid=2
dlt-gtttsel:gtiis=0
dlt-gtttsel:gtins=0
```

Dependencies

The EGTT feature must be turned on before this command can be entered.

The **np** and **npv** parameters cannot be specified together in the same command.

The **nai** and **naiv** parameters cannot be specified together in the same command.

The **gti/gtia=4**, **gti(x)=1**, and **gti(x)=3** parameters cannot be specified.

If the **gti/gtia/gtii/gtin/gtin24/gtiis/gtins=2** parameter is specified, then the **np/npv** and **nai/naiv** parameters cannot be specified.

If the **gtii/gtin/gtin24/gtiis/gtins=4** parameter is specified, then an **np(v)** and **nai(v)** parameter combination must be specified. These parameters can be specified in any combination: **np/naiv**, **npv/nai**, **np/nai**, or **npv/naiv**.

The FLOBR feature must be turned on before the **lsn** or **eaglegen** parameters can be specified.

If the **eaglegen=yes** parameter is specified, then the **lsn**, **selid**, or **cgssn** parameters cannot be specified.

The GTT selector specified by the **gti(x)**, **tt**, and **np(v)** and **nai(v)** parameters must already exist.

A value of **dflt** must be specified for the **np** and **nai** parameters, or neither parameter can have a value of **dflt**.

The OBSR feature must be enabled before the **cgssn** parameter can be specified.

If a value of **dflt** is specified for the **np** and **nai** parameters, then the **cgssn**, **selid**, **lsn**, or **eaglegen** parameters cannot be specified.

The linkset specified by the **lsn** parameter must already exist.

If the **gti(x)=0** parameter is specified, then the **eaglegen**, **tt**, **np/npv**, and **nai/naiv** parameters cannot be specified.

If a value of **2** or **4** is specified for the **gti(x)** parameter, then the **tt** parameter must be specified.

Notes

None

Output

```

dlt-gttset:gti=0
tekelecstp 10-02-05 16:35:13 EST Eagle 42.0.0
dlt-gttset:gti=0
Command entered at terminal #4.
DLT-GTTSEL: MASP A - COMPLTD
;

```

dlt-gttset**Delete GTT Set**

Use this command to delete the specified global title translation set.

NOTE: When the EGTT feature is turned on, the GTT Selector (ent/chg/dlt/rtrv-gttset), GTT Set (ent/dlt/rtrv-gttset), and GTA (ent/chg/dlt/rtrv-gta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is turned on.

Keyword: dlt-gttset

Related Commands: chg-gttset, ent-gttset, rtrv-gttset

Command Class: Database Administration

Parameters

:gttsn= (mandatory)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

Range: ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

Example

```
dlt-gttset:gttsn=t800
```

Dependencies

The EGTT feature must be turned on before this command can be entered.

The **gttsn** parameter must be specified, cannot have a value of **none**, and must match an existing GTT set.

The GTT set cannot be deleted if it is referenced in the GTTSEL or GTA tables or if the GTT set is used by the IS41SMSCGTTSN option (see the **ent/chg-gsmmssopts** command) or BPARTYGTTSN option (see the **ent/chg-is41smssopts** command).

If a translation is provisioned in the specified GTT set, or if the GTT set is referred by any translation, then the GTT set cannot be deleted.

The value specified for the **gttsn** parameter must match the name of an existing GTT Set.

Notes

None

Output

```

dlt-gttset:gttsn=t800
  rlghncxa03w 09-08-09 08:20:26 EST  EAGLE 41.1.0
  DLT-GTTSET: MASP A - Cmpltd

;

```

dlt-gws-redirect**Delete Gateway Screening Redirect Command**

Use this command to delete the provisioning of the redirect function and subsequently to disable the gateway screening redirect function. After the gateway screening redirect function is disabled, you must use **ent-gws-redirect** to enable the function again.

Keyword: **dlt-gws-redirect**

Related Commands: **chg-gws-redirect**, **ent-gws-redirect**,

Command Class: Database Administration

Parameters

This command has no parameters.

Example

```
dlt-gws-redirect
```

Dependencies

The redirect function data that will be deleted (removed) with this command must exist in the database.

Notes

None

Output

```

dlt-gws-redirect

  rlghncxa03w 04-02-10 11:43:04 EST  EAGLE 31.3.0
  DLT-GWS-REDIRECT: MASP A - Cmpltd

;

```

dlt-home-smsc**Delete HOME SMSC Address**

Use this command to delete HOME SMSC specific addresses currently used to identify Short Message Service Centers in the database. This command updates the HOME SMSCADDR table.

Keyword: **dlt-home-smsc**

Related Commands: **ent-home-smsc**, **rtrv-home-smsc**

Command Class: Database Administration

Parameters

:smsc= (mandatory)
Short Message Service Center address.
Range: 1-21 digits
1-21 hexadecimal digits

Example

```
dlt-home-smsc:smc=552611646
```

Dependencies

One of the following features must be enabled before this command can be entered.

- MO SMS IS41-to-GSM Migration
- MO-based GSM SMS NP
- MO-based IS41 SMS NP
- MT-Based GSM SMS NP
- MT-Based IS41 SMS NP
- Portability Check for Mobile Originated SMS

The specified HOME SMSC address must exist in the HOME SMSCADDR table.

Notes

None

Output

```
dlt-home-smsc:smc=552611646

rlghncxa03w 04-02-28 08:50:12 EST EAGLE 31.3.0
DLT-HOME-SMSC: MASP A - COMPLTD
;
```

dlt-homern**Delete Home Routing Number Prefix**

Use this command to delete a routing number prefix from the HOMERN table.

Keyword: dlt-homern

Related Commands: ent-homern, rtrv-homern

Command Class: Database Administration

Parameters

:rn= (mandatory)
The home routing number prefix
Range: 1-15 digits

Example

```
dlt-homern:rn=C441234
```

Dependencies

The specified routing number must already exist in the HOMERN table.

A value of **none** cannot be specified for the **rn** parameter.

The A-Port, AINPQ, G-Port, INP, or V-Flex feature must be turned on before this command can be entered.

Notes

None

Output

```
dlt-homern:rn=C441234

rlghncxa03w 04-02-28 08:50:12 EST EAGLE 31.3.0
HOMERN table is (1 of 100) 1% full
DLT-HOMERN: MASP A - COMPLTD

;
```

dlt-ip-host**Delete Internet Protocol Hostname**

Use this command to delete entries from the IP Host table. The IP Host table defines the local and remote host names and their associated IP addresses.

Keyword: dlt-ip-host

Related Commands: ent-ip-host, rtrv-ip-host

Command Class: Database Administration

Parameters

:host= (mandatory)

Host name. This parameter specifies the logical name assigned to the host device.

Range: `////////////////////////////////////`

A string of characters, beginning with a letter and comprising up to 60 characters in length

Valid values are **a..z**, **A..Z**, **0..9**, **-**, or **.**

Example

```
dlt-ip-host:host=gw100.nc.tekelec.com
```

Dependencies

The value specified for the **host** parameter must begin with an alphabetic character and can contain **a..z**, **A..Z**, **0..9**, **-** (hyphen), or **.** (period). If the host name contains a hyphen, then the host name must be enclosed within quotation marks.

The value specified for the **host** parameter must already exist in the IP Host table.

Before a local entry can be deleted from the IP Host table, all association references to the hostname must be deleted. This rule does not apply to remote host entries.

Notes

None

Output

```
dlt-ip-host:host=gw100.nc.tekelec.com

rlghncxa03w 04-02-17 15:35:05 EST EAGLE 31.3.0
DLT-IP-HOST: MASP A - COMPLTD

;
```

dlt-ip-node**Delete IP Node**

Use this command to remove an IP node from the database that is directly connected to a TCP/IP data link used for the STP LAN feature. You can remove a particular connection, a particular application on a node, or an entire node.

Keyword: dlt-ip-node

Related Commands: ent-ip-node, rtrv-ip-node

Command Class: Database Administration

Parameters

:ipaddr= (mandatory)

The node's IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

Range: 1-223, 0-255

4 numbers separated by dots

1-223—first number

0-255—the other three numbers

:force= (optional)

Whether or not to remove all applications associated with the node, thus removing the entire node from the database.

Range: yes, no

yes — Delete all connections to node

no — Delete specified application or connection

Default: no

:ipappl= (optional)

The IP application supported by the node.

Range: stplan

Default: Default value not given

:ippport= (optional)

The logical IP port that addresses the application on the node.

Range: 1024-5000

Default: The logical IP port is not given.

:loc= (optional)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: The card location is not given.

Example

To delete the connection for a TCP/IP link associated with an STPLAN on a specified location:

```
dlt-ip-node:ipaddr=193.4.201.50:ipappl=stplan:loc=1201
```

To delete the connection for a TCP/IP link associated with an IPPORT on a specified location:

```
dlt-ip-node:ipaddr=193.4.201.50:ippport=1024:loc=1201
```

To delete all connections for TCP/IP links associated with the STPLAN on all locations:

```
dlt-ip-node:ipaddr=193.4.201.50:ipappl=stplan
```

To delete the connection for TCP/IP links associated with an IPPORT:

```
dlt-ip-node:ipaddr=193.4.201.50:ippport=1024
```

To delete all connections for a TCP/IP link associated with any application on a specified location:

```
dlt-ip-node:ipaddr=193.4.201.50:loc=1201
```

To delete all connections for TCP/IP links associated with any application on any location:

```
dlt-ip-node:ipaddr=193.4.201.50:force=yes
```

Dependencies

The **force** parameter. must be specified to remove an entire node.

At least one of the following parameters must sbe specified: **ipappl**, **ipport**, **loc**, or **force=yes**.

If the **force=yes** parameter is specified, the **ipappl**, **ipport**, and **loc** parameters cannot be specified.

The **ipappl** and **ipport** parameters cannot be specified together in the command.

If the **loc** parameter is specified, the shelf and card must be equipped.

If the **loc** parameter is specified, the specified card must have a TCP/IP data link assigned to it.

If the **loc** parameter is specified, the IP port on the node must be assigned to the application for the specified TCP/IP data link.

If the **loc** and **ipaddr** parameters are specified, the specified IP address must match the IP address of the card location's remote IP node.

If the **loc** and **ipport** parameters are specified, the specified IP port must match the card location's remote IP port.

If the **loc** and **ipappl** parameters are specified, the specified IP application must match the card location's remote IP application.

Notes

A particular application can be specified by giving either the application's name (**ipappl**) or its IP port (**ipport**) on the node.

Only Class A, Class B, and Class C IP addresses are supported by the STP LAN feature.

Output

```
dlt-ip-node:ipaddr=193.4.201.50:loc=1201
```

```

dlt-ip-rte

Delete IP Route

Use this command to delete a static IP route entry from the Static IP Route table (destination IP address, subnet mask, and gateway IP address) for the specified card.

CAUTION

CAUTION: The deletion of static IP routes can adversely affect IP connection oriented transports.

Keyword: dlt-ip-rte

Related Commands: , rtrv-ip-lnk

Command Class: Database Administration

Parameters

:dest= (mandatory)

Destination IP Address. The remote destination host or network destination IP Address that is to be removed.

Range: 4 numbers separated by dots, with each number in the range of **0–255**.
The IP address **0.0.0.0** is not valid.

:loc= (mandatory)

Card location. The unique identifier of a specific IP card in the system.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

:force= (optional)

A value of **yes** is required when the card is allowed and this command is to be completed.

Range: **yes, no**
Default: **no**

Example

```
dlt-ip-rte:loc=1301:dest=128.252.10.5
dlt-ip-rte:loc=1301:dest=128.252.10.5:force=yes
```

Dependencies

The value specified for the **loc** parameter must correspond to an SSED CM, E5-ENET, or E5-ENET-B card running the IPGWI, IPLIM, IPLIMI, IPSG, or SS7IPGW application.

The specified destination IP address (**dest** parameter):

- Must not be the default route (0.0.0.0)
- Must not correspond to any loopback address (i.e. 127.X.X.X)
- Must not reside on this card's A or B network

The specified destination IP address must exist in the Static IP Route table.

The card in the location specified with the **loc** parameter should typically be inhibited for this command to complete successfully. The **force=yes** parameter is required when the card is allowed and the command is entered.

Notes

None

Output

```
dlt-ip-rte:loc=1301:dest=128.252.10.5

rlghncxa03w 04-02-17 15:35:05 EST EAGLE 31.3.0
DLT-IP-RTE: MASP A - COMPLTD
;
```

dlt-lbp**Delete Loopback Point**

Use this command to delete one or all far-end loopback points maintained in the Link Fault Sectionalization table for testing data signaling link elements in a single CCS7 transmission path.

Keyword: **dlt-lbp**

Related Commands: **act-lbp, chg-lbp, dact-lbp, ent-lbp, rtrv-lbp**

Command Class: Database Administration

Parameters

:link= (mandatory)

SS7 signaling link. The SS7 signaling link that is to be tested.

Synonym: **port**

Range: **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling link ports.

:loc= (mandatory)

Card location. The unique identifier of a the card containing the signaling link you want to use for loopback point testing.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

:all= (optional)

Deletes all loopback points for the specified signaling link or deletes only the link specified on the **lbp** parameter.

Range: **yes**

:lbp= (optional)

Loopback point ID. This parameter identifies a far-end loopback point that lies along an SS7 signaling link path between the STP and the target device (up to and including the target device).

Range: **1-32**

Example

```
dlt-lbp:loc=1101:link=a:lbp=1
```

```
dlt-lbp:loc=1101:link=a:all=yes
```

Dependencies

At least one optional parameter must be specified.

The **lbp** parameter and the **all** parameter cannot be specified together in the command.

The Link Fault Sectionalization (LFS) feature must be on before this command can be entered.

The loopback point (LBP) must have been previously defined.

The card location (**loc** parameter) must identify a **limds0**, **limt1**, or **limch** (associated to a **limt1**) card configured with either an **ss7ansi** or **ccs7itu** application.

The card location specified in the **loc** parameter must be equipped.

The card location specified in the **loc** parameter cannot be reserved by the system

Notes

None

Output

```
dlt-lbp:loc=1101:link=a:lbp=1

DLT-LBP: MASP A - COMPLTD
;
```

dlt-lnp-serv**Delete LNP Service**

Use this command to delete from the database an LNP service or an alias translation type associated with an LNP service.

Keyword: dlt-lnp-serv

Related Commands: chg-lnp-serv, ent-lnp-serv, rtrv-lnp-serv

Command Class: Database Administration

Parameters

:serv= (mandatory)

Reserved service type name.

Range: ain, in, pcs, wnp, class, lidb, cnam, isvm, lnpqs, wmsc, udf1, udf2, udf3, udf4, lrnqt

:alias= (optional)

Alias translation type.

Range: 000-255

Example

```
dlt-lnp-serv:serv=lidb:alias=236
dlt-lnp-serv:serv=lrnqt
```

Dependencies

The LNP feature must be turned on before this command can be entered.

The value of the **serv** parameter must already exist in the LNP database.

The service must not be referenced in the LNP database.

The value of the **alias** parameter must be associated with the value of the specified **serv** parameter.

The value that is specified for the **alias** parameter must not already exist in the LNP database as a true translation type.

All aliases associated with the LNP service must be deleted before the service can be deleted.

The value of the **alias** parameter must exist in the LNP database.

Notes

None

Output

```
dlt-lnp-serv:serv=cnam:alias=23
rlghncxa03w 10-11-09 16:40:40 EST EAGLE 43.0.0
DLT-LNP-SERV: MASP A - COMPLTD
Command Completed.
;
```

dlt-loopset**Delete Loop Set Command**

Use this command to delete loopset and point code data from the database. This command updates the Loopset table.

NOTE: A total of 6 point codes can be deleted each time the dlt-loopset command is issued. If the command is issued twice, all of the point codes in a loopset can be deleted, creating an empty loopset.

Keyword: dlt-loopset

Related Commands: chg-loopset, ent-loopset, rtrv-loopset

Command Class: Database Administration

Parameters

:name= (mandatory)

Loopset name. This parameter specifies an entry in the Loopset table.

The **name=none** parameter cannot be specified.

Range: *aaaaaaaa*

1 alphabetic and up to 7 alphanumeric characters.

:force= (optional)

The **force=yes** parameter must be specified to delete a single point code entry from a loopset that is being used by GTT.

Range: **yes**

:pcl= (optional)

ANSI point code list with subfields *network indicator-network cluster-network cluster-member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*). This parameter allows up to 6 comma-delimited entries in the point code list.

Synonym: pcla

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.

The point code **000-000-000** is not a valid point code.

:pcli= (optional)

ITU international point code list with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*). This parameter allows up to 6 comma-delimited entries in the point code list.

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pcIn= (optional)

ITU national point code list in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*). This parameter allows up to 6 comma-delimited entries in the point code list.

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcIn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. This parameter allows up to 6 comma-delimited entries in the point code list.

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Example

This example deletes the entire loopset table entry for the loopset rtp7 when that set is not being used by GTT.

```
dlt-loopset:name=rtp7
```

This example deletes a single point code in the entry for the loopset rtp2 when that set is being used by GTT.

```
dlt-loopset:name=rtp2:pc1=3-3-9:force=yes
```

This example deletes a point code for the loopset rtp1 when the loopset is not being used by GTT.

```
dlt-loopset:name=rtp1:pc1=3-3-9
```

Dependencies

The value of the **name** parameter must already exist in the database.

The SCCP Loop Detection feature must be enabled before this command can be entered.

The GTT feature must be turned on before this command can be entered.

A loopset entry cannot be deleted when it is being used by GTT.

If a point code in the Loopset table is being used by GTT, then the **force=yes** parameter must be specified before the **pcl/pcli/pcln/pcln24** parameter can be specified.

The values for the **pcl** parameter cannot consist of any invalid point codes. The valid point codes must be consecutively specified and separated by commas.

The **name=none** parameter cannot be specified.

At least one valid point code must be specified as a value for the **pcl** parameter.

The values for the **pcl** parameter must be unique.

The value of the **pcl** parameter must exist in the loopset entry in the database.

Output

The following example deletes a single point code in the entry for the loopset **rtp2** when the set is being used by GTT.

```
dlt-loopset:name=rtp2:pcl=3-3-9:force=yes
rlghncxa03w 07-02-10 08:48:25 EST EAGLE Rel 35.6.0
LOOPSET table is (11 of 1000) 1% full
DLT-LOOPSET: MASP A - COMPLTD
;
```

dlt-ls

Delete Linkset

Use this command to remove a linkset from the system database. A linkset is a group of signaling links carrying traffic to the same signaling point.

Keyword: **dlt-ls**

Related Commands: **chg-l3t**, **ent-ls**, **rept-stat-ls**, **rtrv-ls**

Command Class: Database Administration

Parameters

:lsn= (mandatory)

Linkset name. This parameter specifies the name of the linkset. Only one linkset name per command can be specified.

Range: *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

Example

```
dlt-ls:lsn=lsna
```

Dependencies

The linkset must be in the database.

The linkset can be removed only if all links associated with the linkset have been removed.

If the linkset is referenced by the historic routeset of any destination, then this command cannot be entered.

The specified linkset cannot be deleted if it has or is a mate linkset.

A gateway linkset can be deleted only from a SEAS terminal, and not from a system terminal.

The linkset cannot be deleted if an SAPC entry is present for the linkset.

If the linkset is referenced by the historic routeset of any exception route destination, then this command cannot be entered.

If multiple linksets are assigned to an adjacent point code, then the proxy linkset must be the final linkset that is deleted.

If the linkset that is specified by the **lsn** parameter is used as an incoming linkset for an exception route entry (see the **rtrv-rtx** command), then this command cannot be entered.

If the linkset is referenced by the GTT selector table, then this command cannot be entered.

Notes

When a linkset is removed from the system database, the related entries are removed automatically from the translation type mapping table.

Output

```

dlt-ls:lsn=lsna
  rlgncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
  Link set table is (114 of 1024) 11% full
  DLT-LS: MASP A - COMPLTD
;

```

dlt-map**Delete Mate Applications**

Use this command to remove mate application entries, groups, or an Alternate RI Mate associated with a MAP Set. This command removes one or more entries from the Remote Point Code Subsystem Number table.

CAUTION: If PC/SSNs within a weighted entity set are deleted such that the entity set's multiplicity mode becomes solitary or dominant, the weight values are reset to indicate a non-weighted entity set.

NOTE: See the "Notes" section for this command for additional information on multiplicity modes.

NOTE: The GTT LS ARI feature must be enabled before an Alternate RI Mate can be deleted from a MAP Set.

Keyword: dlt-map

Related Commands: chg-map, ent-map, rtrv-map

Command Class: Database Administration

Parameters

At least one of these parameters must be specified: **all**, **ssn**.

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:pc= (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:pc/pca/pci/pcn/pcn24= (mandatory)

Post-GTT-translated point code.

:pci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:all= (optional)

This parameter must be specified to remove all subsystem numbers associated with this point code. If this parameter is not specified, only the specified subsystem number is removed.

Range: yes

Default: no

:mapset= (optional)

The MAP set ID.

Range: 1-36000 **dflt**

dflt—Default MAP set

Default: **dflt** - If the Flexible GTT Load Sharing feature is not enabled, the default value of the **mapset** parameter is **dflt**.

:mrnset= (optional)

Alternate RI Mate MRN Set ID.

Range: 1-3000 **dflt**

:ssn= (optional)

Subsystem Number.

Range: 2-255
Default: The specified subsystem number is removed for the given point code.

Example

The following example deletes the single entry PC 1-1-1 with an SSN value of 123 from its mated group. If this is the last entry in the group then the PC is also deleted from the MAP tables:

```
dlt-map:pc=1-1-1:ssn=123
```

The following example deletes each entry of PC 1-1-1 and all SSNs associated with the PC from each of the PC/SSN mated groups. The PC is also deleted from the MAP tables:

```
dlt-map:pc=1-1-1:all=yes
```

The following command deletes subsystem 10 associated with spare PC 1-1-0 from the MAP table.

```
dlt-map:pci=s-1-1-0:ssn=10
```

The following example deletes subsystem 10 associated with PC 1-1-1 in MAP set 362.

```
dlt-map:pc=1-1-1:ssn=10:mapset=362
```

The following example deletes PC 1-1-1 along with all the subsystems associated with this PC in MAP set 362.

```
dlt-map:pc=1-1-1:all=yes:mapset=362
```

The following example deletes PC 1-1-2 along with all the subsystems associated with this PC in the default MAP set.

```
dlt-map:pc=1-1-2:all=yes:mapset=df1t
```

The following example deletes the Alternate RI Mate associated with MAP Set 362.

```
dlt-map:mapset=362:mrnset=1
```

The following example deletes the Alternate RI Mate for the default MAP Set and PC/SSN 1-1-1/10.

```
dlt-map:mapset=df1t:pc=1-1-1:ssn=10:mrnset=1
```

The following example deletes the entry from MAP set.

```
dlt-map:mapset=1:pc=1-1-1:ssn=10
```

Dependencies

The **all** and **ssn** parameters cannot be specified together in the command.

If the **all=yes** parameter is specified, all SSNs for the given PC are removed.

The DPC of the primary subsystem must be a full PC.

The specified remote PC must exist in the MAP table.

The specified SSN must exist in the MAP table entity set associated with the specified remote PC.

An STP true point code that is assigned to an AIQ, ATINPQ, EIR, INP, LNP, or V-Flex subsystem cannot be deleted.

If the **pcn** parameter is specified, the format of the PC must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

If the Flexible GTT Load Sharing feature is not enabled, the **mapset** parameter must not be specified.

If the Flexible GTT Load Sharing feature is enabled, the **mapset** parameter must be specified.

The specified MAP set must exist in the database.

The specified PC/SSN/MAP set must already be provisioned in the MAP table.

If the **pc** and **mapset** parameters are specified, and the **all=yes** parameter is specified, then at least one entry for that PC/MAP set must exist in the MAP table.

If the FGTTLS feature is enabled, then a MAP entry cannot be deleted if the entry is referenced in the MRN, GTT, GTA, GTT Action, GSM MAP Opcode or GSM MAP Screening table using the MAPSET/PC/SSN combination, or if the entry is referenced in the MRN, GTT, GTA GSM MAP Opcode, GSM MAP Screening, or PPSOPTS table using the MAPSET/PC combination, and the entry is the last entry in that MAP set with the specified point code. If the FGTTLS feature is not enabled, then a MAP entry cannot be deleted if the entry is referenced in the GTT, GTA, GTT Action, GSM MAP Opcode or GSM MAP Screening table using the PC/SSN combination or if the entry is referenced in the GTT, GTA, GSM MAP Opcode, GSM MAP Screening, or PPSOPTS table using the point code, and the entry is the last entry in the MAP table with the specified point code.

If the **pcn** or **mpcn** parameter is specified, then the format of the parameter must match the format dictated by the **chg-stpopts:npcfnti** command.

PC and SSN are not primary applications.

The GTT LS ARI feature must be enabled before the **mrnset** parameter can be specified.

If the **mrnset** and the **mapset=dflt** parameters are specified, then the **ssn** parameter must be specified.

The value specified for the **mrnset** parameter must already be associated with a MAP Set.

If the **mrnset** parameter is specified, then the **all** parameter cannot be specified.

If a MAP set is referenced in the GTT table without an associated point code and subsystem number, then the MAP set cannot be deleted.

Notes

For the MAP commands, an entity set consists of a group of PC/SSNs that are used for traffic distribution, and an RC group consists of PC/SSNs within an entity set that have the same RC. In loadsharing mode, an entity set contains 1 RC group. In combined/dominant loadsharing mode, an entity set can contain multiple loadsharing groups.

The EAGLE 5 ISS supports the following modes for nodes/subsystems:

- When a PC/SSN pair is not replicated, the pair is in *solitary* mode. The subsystem acts as the only application, with no backup. If this subsystem fails, messages routed to it are discarded and SCCP management returns “Subsystem Unavailable” messages to the originator.
- A group of replicated PC/SSN pairs are in *dominant* mode if each PC/SSN pair in the group has a unique RC. The specified subsystem with the lowest RC acts as the primary subsystem, while the mate subsystem acts as a backup. In the event of congestion, messages route to the mate subsystem. When the congestion subsides, messages are again routed to the primary (dominant) subsystem.
- A group of replicated PC/SSN pairs are in *load sharing* mode if each PC/SSN pair in the group has the same RC. All messages are evenly distributed at the SCCP level to all nodes/subsystems in the group. In the event of congestion or failure, the non-affected subsystem assumes the load of its failed or congested mate.
- The *combined load sharing/dominant* mode supports a combination of load sharing and dominant mode. A group of PC/SSN pairs are in combined load sharing/dominant mode when at least two of the PC/SSN pairs have the same RC and another node subsystem in the group has a different RC. A combination of node accessibility and RC determines the preferred PC/SSN.

When the Flexible GTT Load Sharing feature is on, MAP load sharing sets are supported. Each MAP set is identified by a new **mapset** parameter.

When the Weighted GTT Loadsharing feature is turned on, weighted entity sets and RC groups are supported, and threshold values can be assigned to each PC/SSN.

Output

```

dlt-map:pc=1-1-0:ssn=10:mapset=362
tekelecstp 08-12-22 12:20:10 EST EAGLE 40.1.0
DLT-MAP: MASP A - COMPLTD
;
dlt-map:mapset=362:mrnset=1
tekelecstp 08-12-22 12:20:10 EST EAGLE 40.1.0
DLT-MAP: MASP A - COMPLTD
;

```

dlt-mrn**Delete Mated Relay Node**

Use this command to delete entries or an Alternate RI Mate from the MRN table. A single command can delete one point code from the group, or delete the entire group.

CAUTION: If PCs within a weighted entity set are deleted such that the entity set's multiplicity mode becomes dominant, the weight values are reset to indicate a non-weighted entity set.

NOTE: See the "Notes" section for this command for additional information on multiplicity modes.

NOTE: The GTT LS ARI feature must be enabled before an Alternate RI Mate can be deleted from an MRN Set.

Keyword: dlt-mrn

Related Commands: chg-mrn, ent-mrn, rtrv-mrn

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:pc= (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (mandatory)

Post-GTT-translated point code.

:pci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:all= (optional)

This parameter is used to delete the entire group of point codes that contains the specified point code in the MRN table.

Range: yes

:mapset= (optional)

Alternate RI Mate MAP Set ID.

Range: 1-36000 dflt

:mrnset= (optional)

The MRN set ID.

Range: 1-3000 dflt

dflt—Default MRN set.

:pc1= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: pca1

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

:pc1/pca1/pci1/pcn1/pcn241= (optional)

Alternate post-GTT-translated point code.

:pc2= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca2

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

:pc2/pca2/pci2/pcn2/pcn242= (optional)

Alternate post-GTT-translated point code.

:pc3= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca3

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

:pc3/pca3/pci3/pcn3/pcn243= (optional)

Post-GTT-translated point code.

:pc4= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca4

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

:pc4/pca4/pci4/pcn4/pcn244= (optional)

Alternate post-GTT-translated point code.

:pci1= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pci2= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pci3= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pci4= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-
zone—0-7
area—000-255
id—0-7

The point code **0-000-0** is not a valid point code.

:pcn1= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-
nnnnn—0-16383
gc—aa-zz
m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn2= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-
nnnnn—0-16383
gc—aa-zz
m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn241= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255
ssa—000-255
sp—000-255

:pcn242= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000–255**

ssa—**000–255**

sp—**000–255**

:pcn243= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000–255**

ssa—**000–255**

sp—**000–255**

:pcn244= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000–255**

ssa—**000–255**

sp—**000–255**

:pcn3= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn4= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

Example

The following example deletes the entire entry for the specified point code (the point code plus all of its associated point codes).

```
dlt-mrn:pc=1-1-0
```

The following example finds point codes 1-1-0 and 1-1-1, and deletes them from the group that contains them in the MRN table.

```
dlt-mrn:pc=1-1-0:pc1=1-1-1
```

The following example deletes from the MRN table the entire group of point codes that contains the specified point code.

```
dlt-mrn:pc=1-1-0:all=yes
```

The following examples include spare point codes.

```
dlt-mrn:pci=s-2-2-1
```

```
dlt-mrn:pcn=s-1-1-1-0235-aa
```

```
dlt-mrn:pc=1-1-9:mrnset=df1t
```

```
dlt-mrn:pc=1-1-9:mrnset=111
```

```
dlt-mrn:pc=1-1-1:pc1=1-1-9:mrnset=111
```

```
dlt-mrn:pc=1-1-9:All=yes:mrnset=111
```

The following example deletes the Alternate RI Mate for MRN Set 111.

```
dlt-mrn:mrnset=111:mapset=123
```

The following example deletes the Alternate RI Mate for the default MRN Set and PC 1-1-1.

```
dlt-mrn:mrnset=df1t:pc=1-1-1:mapset=123
```

The following example deletes the entry from the MRN set.

```
dlt-mrn:mrnset=1:pc=1-1-1
```

Dependencies

ITU-N point codes must be the format set by the **npcfmti** parameter of the **chg-stpopts** command. (Use the **rtrv-stpopts** command to display the STP option settings.)

A point code that is specified in the command must already exist in the MRN table.

The PCs in an entity set cannot be deleted if the deletion leaves only one PC in the entity set. If this occurs, the entire entity set must be deleted by specifying the **all=yes** parameter.

The **mrnset** parameter can be specified only when the Flexible GTT Load Sharing feature is enabled.

If the Flexible GTT Load Sharing feature is enabled, then the specified PC must already exist in the specified MRN set.

The specified MRN set must already exist in the MRN table.

If the FGTTLS feature is enabled, then an MRN entry cannot be deleted if the entry is referenced in the MAP, GTT, GTA, GTT Action, or PPSOPTS table, using the MRNSET/PC combination. If the FGTTLS feature is not enabled, then the MRN entry cannot be deleted if the entry is referenced in the GTT, GTA, GTT Action, or PPSOPTS table, using the point code.

If the **all=yes** parameter is specified, the **pc** parameter must be specified, and the **pc1/pc2/pc3/pc4** parameters cannot be specified.

The same point code value cannot be entered more than once for deletion.

The **pc/pc1/pc2/pc3/pc4** parameter values must be full point codes.

The GTT LS ARI feature must be enabled before the **mapset** parameter can be specified.

The value specified for the **mrnset** parameter must already be associated with a MAP Set.

If the **mapset** parameter is specified, then the **pc1**, **pc2**, **pc3**, **pc4**, and **all** parameters cannot be specified.

An MRN set cannot be deleted if the MRN set is referenced in the GTT table without an associated point code.

Notes

For the MRN commands, an entity set consists of a group of PCs that are used for traffic distribution, and an RC group consists of PCs within an entity set that have the same RC. In loadsharing mode, an entity set contains 1 RC group. In combined/dominant loadsharing mode, an entity set can contain multiple loadsharing groups.

The EAGLE 5 ISS supports the following modes for nodes/subsystems:

- A group of replicated PCs are in *dominant* mode if each PC in the group has a unique RC. The specified subsystem with the lowest RC acts as the primary subsystem, while the mate subsystem acts as a backup. In the event of congestion, messages route to the mate subsystem. When the congestion subsides, messages are again routed to the primary (dominant) subsystem.
- A group of replicated PCs are in *load sharing* mode if each PC in the group has the same RC. All messages are evenly distributed at the SCCP level to all nodes/subsystems in the group. In the event of congestion or failure, the non-affected subsystem assumes the load of its failed or congested mate.
- The *combined load sharing/dominant* mode supports a combination of load sharing and dominant mode. A group of PC are in combined load sharing/dominant mode when at least two of the PC have the same RC and another node subsystem in the group has a different RC. A combination of node accessibility and RC determines the preferred PC.

The Flexible Intermediate GTT Loadsharing feature adds support for loadsharing sets, which are identified by the **mrnset** parameter.

The Flexible GTT Loadsharing feature and the Intermediate GTT Loadsharing feature used together support MRN sets for flexible intermediate GTT loadsharing.

When the Weighted GTT Loadsharing feature is turned on, weighted entity sets and RC groups are supported, and threshold values can be assigned to each PC/SSN.

Output

```
dlt-mrn:pc=1-1-1:mrnset=111

dlt-na

Delete Network Appearance

Use this command to delete a previously defined network appearance.

Keyword: dlt-na
Related Commands: ent-na, rtrv-na
Command Class: Database Administration

Parameters

:na= (mandatory)
 Network appearance.
Range: 0-4294967295

:type= (mandatory)
 Type of the network appearance to be deleted.
Range: ansi, itui, ituis, itun, ituns, itun24

:gc= (optional)
 Group Code of the network appearance.
Range: yy
 2 alphabetic characters; valid values are aa-zz

Example

```
dlt-na:type=ansi:na=10
dlt-na:type=itui:na=11
dlt-na:type=itun:na=10
dlt-na:type=itun:na=11:gc=fr
dlt-na:type=ituis:na=4
```

Dependencies

Group Code (**gc**) is not allowed with network types **ansi**, **itui**, **ituis**, and **itun24**.
 The specified network appearance must exist in the Network Appearance table

Notes

The ITUDUPPC feature must be turned on before a group code can be deleted for an ITU-N network type

Output

```
dlt-na:pstncat=5000:pstnid=1:force=yes

rlghncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0
DLT-NA: MASP A - COMPLTD
;
```

dlt-npp-as

Delete a NPP Action Set

Use this command to delete an NPP Action Set (AS) entry.

Keyword: dlt-npp-as
Related Commands: chg-npp-as, dlt-npp-srs, ent-npp-as, rtrv-npp-as
Command Class: Database Administration

Parameters

:asn= (mandatory)
 Action set name. This parameter specifies the name of the AS.
Range: ayyyyyyyyy
 1 alphabetic character followed by up to 9 alphanumeric characters

Example

```
dlt-npp-as:asn=asn1
```

Dependencies

The value specified for the **asn** parameter must exist in the NPP AS table.

If the AS is referenced by a NPP Service Rule Set, then this command cannot be entered.

Output

```
dlt-npp-as:asn=asn1
tekelecstp 09-02-19 13:57:06 EST EAGLE 40.1.0
NPP-AS table is (4 of 1024) 1% full.

DLT-NPP-AS: MASP A - COMPLTD
;
```

dlt-npp-srs**Delete an NPP Service Rule Set**

Use this command to delete an NPP Service Rule Set (SRS).

Keyword: dlt-npp-srs

Related Commands: chg-npp-as, chg-npp-srs, dlt-npp-srs, ent-npp-as, rtrv-npp-as, rtrv-npp-srs

Command Class: Database Administration

Parameters

:fdl= (mandatory)

Filter digit length. This parameter specifies the number of digits on the incoming digit string that is filtered by the NPP.

Range: 1-32 *

*—multiple lengths of messages can be filtered

:fnai= (mandatory)

Filter Nature of Address Indicator (NAI).

Range: intl, natl, nai1, nai2, nai3, unkn

intl — filter messages with NAI=INTL

natl — filter messages with NAI=NATL

nai1 — filter messages with NAI=NAI1

nai2 — filter messages with NAI=NAI2

nai3 — filter messages with NAI=NAI3

unkn — filter messages when the NAI is unknown

:fpfx= (mandatory)

Filter prefix. This parameter specifies the prefix used to filter incoming digit strings.

Range: 1-16 digits, *, ?

1 - 16 hexadecimal digits inclusive of single digit wildcard (?); or wildcard (*) matching the entire digit string; valid digits are ?, 0-9, a-f, A-F.

:srvn= (mandatory)

Service name. This parameter specifies the name of the NPP Service.

Range: nppt, idprcdpn, idprcgpn, tif, tif2, tif3, mosmsicgpn, mosmsicdpn, mosmsgcgpn, mosmsgcdpn, iarcdpn, iarcdpn, idprcdpn2, idprcdpn3, idprcdpn4, tificgpn, tificgpn2, tificgpn3

nppt — NPP Test Service

idprcdpn — IDPRCDPN Service

idprcgpn — IDPRCGPN Service
tif — TIF Service
tif2 — TIF2 Service
tif3 — TIF3 Service
mosmsicgpn — MOSMSICGPN Service
mosmsicdpn — MOSMSICDPN Service
mosmsgcgpn — MOSMSGCGPN Service
mosmsgcdpn — MOSMSGCDPN Service
iarcdpn — IARCDPN Service
iarcgpn — IARCGPN Service
idprcdpn2 — IDPRCDPN2 Service
idprcdpn3 — IDPRCDPN3 Service
idprcdpn4 — IDPRCDPN4 Service
tifcgpn — TIFCGPN Service
tifcgpn2 — TIFCGPN2 Service
tifcgpn3 — TIFCGPN3 Service

Example

```

dlt-npp-srs:svrn=nppt:fpfx=a:fdl=10:fnai=intl
dlt-npp-srs:svrn=nppt:fpfx=abc:fdl=16:fnai=intl
dlt-npp-srs:svrn=idprcdpn4:fnai=intl:fdl=12:fpfx=91
  
```

Dependencies

The NPP Rule must exist in the NPP Rule table.

Notes

MTT 4945 deleted for PR 194868 in rel 43.0
None

Output

```

dlt-npp-srs:svrn=nppt:fpfx=abc:fdl=16:fnai=intl
tekelecstp 09-02-19 13:57:01 EST EAGLE 40.1.0
NPP-SRS table is (0 of 8192) 0% full.

DLT-NPP-SRS: MASP A - COMPLTD

```

dlt-pct

Delete a Point Code and CIC Translation entry

Use this command to delete a Point Code and CIC Translation.

Keyword: dlt-pct

Related Commands: ent-pct, rtrv-pct

Command Class: Database Administration

Parameters

:epc= (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: epca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

:epci= (mandatory)

ITU international destination point code with subfields *zone-area-id*.

Range: **0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The point code **0-000-0** is not a valid point code.

zone—**0–7**

area—**000–255**

id—**0–7**

:epcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range: **0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:realpc= (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **realpca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

:realpci= (mandatory)

ITU international destination point code with subfields *zone-area-id*.

Range: **0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The point code **0-000-0** is not a valid point code.

zone—**0–7**

area—**000–255**

id—**0-7**

:realpcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range: **0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:ecice= (optional)

This parameter specifies the end of the Emulated Circuit Identification Code range.

Range: **0-16383, * 0-4095, * 0-4294967295 ***

· **0-4095**—ITU TUP/ISUP

· **0-16383**—ANSI ISUP

· **0-4294967295**—ANSI Q.BICC

Default: *

:ecics= (optional)

This parameter specifies the start of the Emulated Circuit Identification Code range.

Range: **0-16383, * 0-4095, * 0-4294967295 ***

· **0-4095**—ITU TUP/ISUP

· **0-16383**—ANSI ISUP

· **0-4294967295**—ANSI Q.BICC

Default: *

:filtpc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **filtpca**

Range: **000-255, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

When **chg-sid:pctype=ansi** is specified, *ni*-*-* is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

:filtpci= (optional)

ITU international destination point code with subfields *zone-area-id*.

Range: **0-255, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:filtpcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range: **16363, aa-zz, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:rcice= (optional)

This parameter specifies the end of the Real Circuit Identification Code range.

Range: **0-16383, * 0-4095, * 0-4294967295 ***

· **0-4095**—ITU TUP/ISUP

· **0-16383**—ANSI ISUP

· **0-4294967295**—ANSI Q.BICC

Default: *****

:rcics= (optional)

This parameter specifies the start of the Real Circuit Identification Code range.

Range: **0-16383, * 0-4095, * 0-4294967295 ***

· **0-4095**—ITU TUP/ISUP

· **0-16383**—ANSI ISUP

· **0-4294967295**—ANSI Q.BICC

Default: *****

:si= (optional)

Service Indicator

Range: **0, 3, 5, 4, 13, ***

0, *—NM

3, *—SCCP

5, *—ISUP

4, *—TUP

13, *—ANSI Q. BICC

Default: *****

:ssn= (optional)

SCCP Subsystem number

Range: **0-255 ***

Default: *

Example

```
dlt-pct:epc=1-1-1:si=3:ssn=10
```

```
dlt-pct:realpc=2-2-2:si=5:ecics=20
```

Dependencies

The values specified for the **epc/epca/epci/epcn**, **filtpc/filtpca/filtpci/filtpcn**, and **realpc/realpca/realpci/realpcn** parameters must be within the range specified by the parameter definition.

The value specified for the **ecice** or **rcice** parameter must be equal to or greater than the value specified for the **ecics** or **rcics** parameter, respectively.

A full point code must be specified as the value for the **realpc/realpca/realpci/realpcn** and **epc/epca/epci/epcn** parameters.

A PCT quantity feature must be enabled before this command can be entered.

If the ITUDUPPC feature is on, and ITU-N Point codes are specified, then the values specified for the **epcn**, **realpcn**, and **filtpcn** parameters must have the same group code.

The values specified for the **epc/epca/epci/epcn**, **filtpc/filtpca/filtpci/filtpcn**, and **realpc/realpca/realpci/realpcn** parameters must have the same domain.

If the **ssn** or **ecics** parameter is specified, then the **si** parameter must be specified.

A spare point code cannot be specified as a value for the **epci/epcn**, **filtpci/filtpcn**, and **realpci/realpcn** parameters.

A PCT translation entry with the specified parameters must exist.

The **si=3** parameter must be specified before the **ssn** parameter can be specified.

If the **ecice** or **rcice** parameter is specified, then the **ecics** or **rcics** parameter must be specified, respectively.

If the **rcics** parameter is specified, then the **ecics** parameter must be specified.

If the **ecics**, **ecice**, and **rcics** parameters are specified, then the **rcice** parameter must be specified.

A value of **4**, **5**, or **13** must be specified for the **si** parameter before the **ecice/ecics** and **rcice/rcics** parameters can be specified.

The values specified for the **epc/epca/epci/epcn**, **filtpc/filtpca/filtpci/filtpcn**, and **realpc/realpca/realpci/realpcn** parameters cannot be the same as the STP point code.

The values specified for the **epc/epca/epci/epcn**, **filtpc/filtpca/filtpci/filtpcn**, and **realpc/realpca/realpci/realpcn** parameters cannot be the same as the STP capability point code.

The values specified for the **realpc/realpca/realpci/realpcn** and **filtpc/filtpca/filtpci/filtpcn** parameters must already exist in the Route table.

The values specified for the **realpc/realpca/realpci/realpcn** and **filtpc/filtpca/filtpci/filtpcn** parameters must have at least one route for each value defined in the Route table.

The value specified for the **ecics/ecice** and **rcics/rcice** parameters must be within the range specified by the parameter definition.

The difference between the values specified for the **ecice** and **ecics** parameters must be equal to the difference between the values specified for the **rcice** and **rcics** parameters.

The **ssn** and **cic** parameters cannot be specified together in the command.

If the **ecics**, **rcics** and **rcice** parameters are specified, then the **ecice** parameter must be specified.

If the same value is specified for the **epc** and **realpc** parameters, then the values specified for the **ecics/ecice** and **rcics/rcice** parameters cannot indicate the same range.

Only one of the **filtpc/a**, **filtpci**, and **filtpcn** parameters can be specified in the command.

The value specified for the **epc/epci/epcn** parameter cannot be the same as a secondary point code.

Output

```
dlt-pct:epc=1-1-1:realpc=5-5-5:si=3:ssn=10
tekelecstp 10-08-10 18:29:41 EST EAGLE 43.0.0

Command entered at terminal #4.
DLT-PCT: MASP A - COMPLTD
;
```

dlt-prefix

Delete Prefix

Use this command to delete a prefix based on the name of the feature, its prefix, and its prefix number.

Keyword: dlt-prefix

Related Commands: chg-prefix, rtrv-ctrl-feat, rtrv-prefix

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:feature= (mandatory)

Feature Name. This parameter specifies the name of an enabled controlled feature that is supported by this command. The parameter value must match the feature name as it is displayed in the **rtrv-ctrl-feat** command output.

Range: aaaaaaaaaaaaaaaaaaaaaaaaaa

1 alphabetic character and up to 24 optional alphanumeric characters and spaces, enclosed in double quotation marks.

The parameter value is not case-sensitive; upper case or lower case or both can be entered.

Part or all of the feature name can be entered. If part of the feature name is specified, the entry must start with the first letter of the name, and must contain enough of the name to uniquely identify the feature. For example, there are two feature names that begin with "GSM MAP." Enter enough additional characters to identify which GSM MAP feature is being entered (at least "GSM MAP SR" to identify the "GSM MAP SRI Redirect" feature). This command supports the following controlled features:

- GSM MAP SRI Redirect
- ISUP NP for EPAP

:prefix= (mandatory)

Prefix Value.

Range: 1-15 digits
1-15 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: Current value

:prefixnum= (mandatory)

Prefix Number. The prefix number identifies the prefix value to use for the specified feature name.

Range: **1-7**
1-3 for GSM MAP SRI Redirect feature prefix values
1-5 for ISUP NP with EPAP feature prefix values
6 for the ISUP NP with EPAP feature Insertion Country Code
7 for the ISUP NP with EPAP feature Deletion Condition value

Default: Current value

Example

Delete a prefix with prefix number 1 for the ISUP NP with EPAP feature.

```
dlt-prefix:feature="isup np with epap":prefix=1004:prefixnum=1
```

Delete a prefix with prefix number 2 and specify part of the GSM MAP SRI Redirect feature name.

```
dlt-prefix:feature="GSM MAP SRI":prefix=104:prefixnum=2
```

Dependencies

The specified feature name must be the name of an enabled controlled feature as it is displayed in the **rtrv-ctrl-feat** command output. The specified feature must be one of the following features that are supported by this command:

- GSM MAP SRI Redirect
- ISUP NP for EPAP

The specified feature prefix value must already exist in the database.

The specified feature prefix value must be used by the specified feature in the database.

Notes

None

Output

```
dlt-prefix:feature="isup np with epap":prefix=1004:prefixnum=1
```

```
rlghncxa03w 04-09-20 09:04:14 EST EAGLE 31.11.0

```

```
;
```

dlt-rmt-appl

Delete Remote Application

Use this command to remove remote application assignments from the database.

Keyword: **dlt-rmt-appl**

Related Commands: **ent-rmt-appl**, **rtrv-rmt-appl**

Command Class: Database Administration

Parameters

:ipc= (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (prefix-ni-nc-ncm).

Synonym: **ipca**

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.

The point code **000-000-000** is not a valid point code.

:ipc/ipca/ipci/ipcn/ipcn24= (mandatory)

End node's internal point code.

:ipci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:ipcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:ipcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:si= (mandatory)

Service indicator value that designates which user part is assigned to IPC.

Range: **3-15**

:ssn= (optional)

SCCP subsystem number. Valid only if **si=3**. Use **ssn** as the starting value of the range if **ssne** is specified.

Range: **0-255**

:ssne= (optional)

Specifies the end range of subsystem number.

Range: 1-255

Example

```
dlt-rmt-appl:ipc=0-0-1:si=3:ssn=5
dlt-rmt-appl:ipc=0-0-1:si=5
dlt-rmt-appl:ipcn24=1-100-1:si=5
dlt-rmt-appl:ipci=ps-2-2-2:si=5
```

Dependencies

Partial point codes are not allowed.

The **ssn** parameter is required if **si=3**.

The **ssn** and **ssne** parameters are not allowed unless **si=3**.

The **ssne** parameter value must be greater than the **ssn** parameter value.

The specified **ipc** must be previously defined in the Destination table.

The new entry cannot conflict with an existing entry.

The **ipc**, **si**, and **ssn...ssne** parameter values must all match a value in the Destination table.

Notes

To specify a range of subsystem numbers, specify the **ssn** parameter value as the start of the range and the **ssne** parameter value as the end of the range.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

Output

```
dlt-rmt-appl:ipc=0-0-1:si=3:ssn=5
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
DLT-RMT-APPL: MASP A - COMPLTD
;
```

dlt-rte

Delete Route

Use this command to remove either a single route or all routes from the system database.

Keyword: dlt-rte

Related Commands: chg-dstn, chg-rte, dlt-dstn, ent-dstn, ent-rte, rept-stat-dstn, rept-stat-rte, rtrv-dstn, rtrv-rte

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

At least one of the following optional parameters must be specified: **dpc/dpca/dpci/dpcn/dpcn24** or **cic**. If the **dpc/dpca/dpci/dpcn/dpcn24** parameter is specified, then action is taken upon the historic routes of the destination entity only.

:all= (optional)

This parameter removes all destinations from the system database.

Range: yes

Default: no

:dpc= (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **dpca**

Range: **p-, 000-255, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

The asterisk value (*) is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Destination point code.

:dpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**
msa—**000-255**
ssa—**000-255**
sp—**000-255**

:lsn= (optional)

Linkset name. This parameter specifies the name of the linkset associated with the route.

NOTE: This parameter must be specified when the all parameter is not specified, and cannot be specified when the all=yes parameter is specified.

Range: *ayyyyyyyyy*
 1 alphabetic character followed by 9 alphanumeric characters

Default: No linkset name is specified

Example

Delete route to dpc 1-1-1 using linkset hq435326:

dlt-rte:dpc=1-1-1:lsn=hq435326

Delete all routes to dpc 2-2-2:

dlt-rte:dpc=2-2-2:all=yes

Delete all routes to dpc 21-*-*:

dlt-rte:dpc=21-*-*:all=yes

Delete route to dpcn=3-15-15-15-sp using link e1m2itun:

dlt-rte:dpcn=3-15-15-15-sp:lsn=e1m2itun

Delete route for dpcn24=10-100-14 using linkset we123624:

dlt-rte:dpcn24=10-100-14:lsn=we123624:rc=10

Delete route to private point code dpc=p-1-1-1 using linkset hq325426:

dlt-rte:dpc=p-1-1-1:lsn=hq325426

Delete all routes to private point code dpc=p-21-*-*:

dlt-rte:dpc=p-21-*-*:all=yes

Delete route to spare point code dpci=s-1-100-1 using linkset we123624:

dlt-rte:dpci=s-1-100-1:lsn=we123624

Dependencies

The **dpc/dpca/dpci/dpcn/dpcn24** parameter must exist in the Destination Point Code table.

The value of the **lsn** parameter must exist in the Linkset table.

If the **all=yes** parameter is specified, then the **lsn** parameter cannot be specified.

At least one optional parameter must be specified.

The destination point code of a route must be a full point code (*ni-nc-ncm*) or a cluster point code (*ni-nc-**).

If the specified destination address is a full point code address (*ni-nc-ncm*) and is a member of a provisioned cluster (*ni-nc-**), then whether the ordered routes can be deleted is determined by the destination address's nested cluster allowed indicator. This value is set with the **ncai** parameter of the **ent/chg-dstn** commands:

- If the **ncai=no** parameter is specified, then the ordered route cannot be deleted.
- If the **ncai=yes** parameter is specified, then the destination address is a member of a provisioned nested cluster where the ordered routes of the provisioned members can be

deleted. Deletion of the ordered routes of a provisioned member results in the provisioned member assuming the attributes of its cluster

If the specified destination address is a network cluster address (*ni-nc-**), then the method used to delete the specified ordered route attributes is determined by the setting of the destination address's nested cluster allowed indicator. This value is set with the **ncai** parameter of the **ent/chg-dstn** commands.

- If the **ncai=no** parameter is specified, then the specified ordered route is deleted for each signaling point code having the same network identifier (*ni*) and network cluster (*nc*) codes.
- If the **ncai=yes** parameter is specified, then the specified destination is a nested cluster where deletion of the cluster route will not delete the ordered route of the provisioned member.

If the **dpcn** parameter is specified, the format of the point code(s) must match the format you assigned with the **chg-stpopts:npfmt** parameter.

The last route for the specified destination point code being removed cannot be referenced by a mated application, or a concerned signaling point code. If any of the destinations referencing the specified routset exist in the MAP table, then the last route of the routeset cannot be deleted.

If any of the destinations referencing the routset is used by the redirect function, then the last route of the routeset cannot be deleted.

The last route to a destination point code that exists in the MRN table cannot be deleted until the point code is deleted from the MRN table. If any of the destinations referencing the specified routset exists in the MRN table, then the last route of the routeset cannot be deleted.

The last route to a destination point code that still exists in the Concerned Secondary Point Code (CSPC) table cannot be deleted until the point code is deleted from the CSPC table. If any of the destinations referencing the routset exist in the CSPC table, then the last route of the routeset cannot be deleted.

If the destination point codes associated with the routeset are referenced by GTT, then the last route cannot be deleted. If the last route to a destination point code is referenced by a GTT, then then the route cannot be deleted until one of the following actions is performed:

- Delete the GTT using the route's destination.
- Change the route used by the GTT to a route using a different destination.
- Add another route using the same destination.

The NRT feature must be turned on before the **dpc/dpca/dpci/dpcn/dpcn24** parameter can be specified.

When using network routing, if the destination point code has a value of * in the *nc* field, the *ncm* field must also be * (for example, **dpc=21-*-***).

If the routeset does not contain routes, then the **all=yes** parameter cannot be specified.

If the destination point code is specified, then the linkset must exist in the historic routeset. If the routeset is specified, then the linkset must exist in the RSET table.

The last route to a destination that contains exception routes cannot be deleted. If any of the destinations referencing the specified routset contains exception routes, then the last route of the routeset cannot be deleted. If a cluster point code is provisioned with **ncai=no**, and any cluster member has an associated exception route, then the routeset cannot be deleted using the **all=yes** parameter.

The value of the **dpc/dpca/dpci/dpcn/dpcn24** parameter cannot exist in the Application Filter table.

The last route to a destination point code that still exists in the Prepaid SMS Options (PPSOPTS) table cannot be deleted until the point code is deleted from the PPSOPTS table. If any of the destinations referencing the routset exist in the PPSOPTS table, then the last route of the routeset cannot be deleted.

If multiple routes are assigned to a point code, then the route that uses the proxy linkset must be the final route that is deleted.

The network type of the linkset and routeset must match.

The last route to a destination point code that exists in the PCT table cannot be deleted until the Filter Point Code or the Real Point Code is deleted from the table.

Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

Output

```
dlt-rte:dpc=1-1-1:lsn=ls01
  rlgncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
  DLT-RTE: MASP A - COMPLTD
;
```

In the following example, the GTT feature is turned on.

```
dlt-rte:dpc=2-2-2:all=yes
  rlgncxa03w 10-03-06 11:43:04 EST EAGLE 42.0.0
  WARNING - ROUTE MAY BE REFERENCED BY MAP OR CSPC.
  DLT-RTE: MASP A - COMPLTD
;
```

dlt-rtx

Delete Exception Route

Use this command to delete an exception route entry. If only the **dpc** and criteria (**opc/ilsn/cic/si**) parameters are specified, then all exception route entries associated with those parameters are deleted.

Keyword: dlt-rtx

Related Commands: chg-rtx, ent-rtx, rept-stat-rtx, rtrv-rtx

Command Class: Database Administration

Parameters

:dpc= (mandatory)

ANSI destination point code with subfields *network indicator-network-cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: dpca

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (mandatory)

Destination point code.

:dpci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:cic= (optional)

Starting Circuit Identification Code. This parameter is used alone or together with the **ecic** parameter as exception routing criteria for the specified exception route.

Range: **0-16383**

:ecic= (optional)

Ending Circuit Identification Code. This parameter, together with the **cic** parameter defines the CIC range that is used as exception routing criteria for the specified exception route.

Range: **16383**

:ilsn= (optional)

Incoming Link Set Name. This parameter contains the name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

Range: *ayyyyyyyyy*
1 alphabetic character followed by up to 9 alphanumeric characters.

:lsn= (optional)

Linkset Name. This parameter provides the name of the linkset associated with the specified exception route.

Range: *ayyyyyyyyy*
1 alphabetic character followed by up to 9 alphanumeric characters.

:opc= (optional)

ANSI origination point code with subfields *network indicator-network-cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range: **p-, 000-255**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—p-
When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.
When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.
When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.
The point code **000-000-000** is not a valid point code.

:opc/opca/opci/opcn/open24= (optional)

Originating Point Code

:opci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—s-, p-, ps-
zone—0-7
area—000-255
id—0-7
The point code **0-000-0** is not a valid point code.

:opcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—s-, p-, ps-
nnnnn—0-16383
gc—aa-zz

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:opc_n= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-**, **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:si= (optional)

Service Indicator. This parameter is used as part of the exception routing criteria for the specified exception route.

Range: **3-15**

Example

```
dlt-rtx:dpca=1-1-1:opc:2-3-3:lsn=1set1
```

```
dlt-rtx:dpca=1-2-1:si=3:lsn=1set2
```

```
dlt-rtx:dpca=1-3-1:ilsn=1set2:lsn=1set3
```

```
dlt-rtx:dpci=2-100-1:ilsn=1set2:lsn=1set4
```

```
dlt-rtx:dpci=2-100-1:si=5:lsn=1set5
```

```
dlt-rtx:dpci=2-100-1:si=6
```

```
dlt-rtx:dpci=2-100-1:opc=8-***
```

Dependencies

Only one of the **opc**, **ilsn**, **cic**, or **si** parameters can be specified for an exception route entry.

If the **ecic** parameter is specified, the **cic** parameter must also be specified.

The **ecic** parameter value cannot be less than the **cic** parameter value.

The Origin-Based MTP Routing feature must be enabled and turned on before this command can be entered.

The linkset name, as defined by the **ilsn** or **lsn** parameter, must exist.

The specified combination of exception route parameter conditions must exist.

The value specified for the destination point code must be a full point code and not a cluster or network point code.

The point code specified by the **dpc**, **dpca**, **dpci**, **dpcn**, or **dp_n** parameter must exist in the destination table.

Output

Delete a specific exception route.

```
dlt-rtx:dPCA=1-3-1:iLSN=1set2:1sn=1set3
stdcfg2b 06-05-19 18:20:11 EST EAGLE 35.0.0
DLT-RTX: MASP A - COMPLTD
```

Delete all exception routes for a specific exception criteria.

```
dlt-rtx:dPCI=2-100-2:opc=8-***
tekelecstp 08-02-25 10:54:07 EST EAGLE 38.0.0
Command entered at terminal #4.
DLT-RTX: MASP A - COMPLTD
```

;

dlt-sccp-serv**Delete SCCP Service**

Use this command to remove entries from the SCCP Service table. The command may either remove a PC from a group or remove the entire group.

Keyword: dlt-sccp-serv

Related Commands: chg-sccp-serv, rtrv-sccp-serv

Command Class: Basic

Parameters

:serv= (mandatory)

The name of the service being deleted.

Range: gflex, gport

:all= (optional)

Deletes all point codes from a service.

Range: yes

:pc1= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:pc1/pca1/pci1/pcn1/pcn241= (optional)

Post GTT-translated point code 1.

:pc2= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca2

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001–005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006–255*.

The point code **000-000-000** is not a valid point code.

:pc2/pca2/pci2/pcn2/pcn242= (optional)

Post GTT-translated point code 2.

:pc3= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **pca3**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001–005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006–255*.

The point code **000-000-000** is not a valid point code.

:pc3/pca3/pci3/pcn3/pcn243= (optional)

Post GTT-translated point code 3.

:pc4= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001–005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006–255*.

The point code **000-000-000** is not a valid point code.

:pc4/pca4/pci4/pcn4/pcn244= (optional)

Post GTT-translated point code 4.

:pci1= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pci2= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pci3= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pci4= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pcn1= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn2= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn241= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:pcn242= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:pcn243= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:pcn244= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:pcn3= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn4= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

Example

To delete a specified PC from the G-Port service:

```
dlt-sccp-serv: serv=gport: pca2=3-3-3
```

To delete all PCs from the G-Port service and to specify a network PC to delete:

```
dlt-sccp-serv: serv=gport: all=yes: pca1=1-1-1
```

Dependencies

At least one PC must be specified.

The specified PC must already exist in the SCCP Service table.

The same point code cannot be specified more than once.

The specified point code must already exist in the specified MRN set in the SCCP-SERV table.

At least one point code must be specified.

The specified MRN set must already exist in the SCCP-SERV table portion of the MRN table.

Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Output

```
dlt-sccp-serv: serv=gport: pca2=3-3-3
tekelecstp 05-12-20 08:54:59 EST EAGLE 35.0.0
DLT-SCCP-SRV: MASP A - COMPLTD
;
```

dlt-scr-aftpc**Delete Allowed Affected Point Code**

Use this command to remove a specific screening reference in the allowed affected point code category.

Keyword: dlt-scr-aftpc

Related Commands: chg-scr-aftpc, ent-scr-aftpc, rtrv-scr-aftpc

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*
1 alphabetic character followed by up to 3 alphanumeric characters

:ssn= (mandatory)

Subsystem number. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:area= (optional)

ITU international area. This parameter specifies the *area* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:id= (optional)

ITU international ID. This parameter specifies the *ID* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7 ***

:msa= (optional)

24-bit ITU-national main signaling area value. This parameter specifies the *msa* of the point code *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:nc= (optional)

Network cluster value. This parameter specifies one or more **nc** values for the network indicator and network cluster member values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:ncm= (optional)

Network cluster member value. This parameter specifies one or more **ncm** values for the network indicator and network cluster values identified in the **ni** and **nc** parameters. It specifies the *ncm* of

the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:ni= (optional)

Network indicator value. This parameter specifies one or more **ni** values for the network cluster and network cluster member values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:npc= (optional)

ITU national point code. An asterisk (*) indicates the full range of values from **0-16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: **0-16383 ***

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: **none, s**

Default: **none**

:sp= (optional)

24-bit ITU national signaling point. This parameter specifies the *sp* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:ssa= (optional)

24-bit ITU national sub signaling area. This parameter specifies the *ssa* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:zone= (optional)

ITU international zone. This parameter specifies the *zone* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7, ***

Example

```
dlt-scr-aftpc:sr=iec:ni=240:nc=010:ncm=010:ssn=012
```

```
dlt-scr-aftpc:sr=aft1:zone=1:area=2:id=3:ssn=1:pcst=s
```

Dependencies

A complete point code must be specified, and must be one, and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**.

The affected point code or point code range (given by **ni-nc-ncm/ssn** or **zone-area-id** or **msa-ssa-sp** or **npc**) to be removed from the table must already exist in the screening reference.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If asterisk values are specified, the range cannot overlap or contain any of the point code ranges that already exist in the allowed affected point code screening category.

If **zone=*** is specified, **area=*** and **id=*** must be specified.

If **area=*** is specified, **id=*** must be specified.

If **ssa=*** is specified, **sp=*** must be specified.

If **msa=*** is specified, **ssa=*** and **sp=*** must be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

The character **c** is not a valid value for the **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, and **npc** parameters.

The specified screening reference (**sr**) must already exist in the database.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

No AFTPC screening reference (**sr**) can be deleted that is referenced by an entity in another screening set.

You cannot remove the **sr**, **ni**, **nc**, **ncm**, and **ssn** parameters, or the **zone**, **area**, **id** and **npc** parameters, if they are the last entry in the screening reference and the screening reference is part of a screen set.

If only one entry exists, the **sr** must not be referenced by another screening table. If the **sr** is not referenced by another screening table, the entire screening table is deleted.

Notes

The asterisk is a parameter value indicating that the gateway screening process is screening all values for that parameter in the MSU. The asterisk parameter value does not mean that multiple entries whose values may be in the range implied by the asterisk will be removed. The only entry that will be removed by this command when the asterisk is specified as a parameter value is the entry that contains an asterisk as that parameter value.

For example, if the **dlt-scr-aftpc:sr=ied:ni=240:nc=010:ncm="":ssn=*** command is entered, the only entry that will be removed from the database is the entry in screening reference **iee** that contains the values **ni=240**, **nc=010**, **ncm=***, and **ssn=***. For an entry to be specified in this command with asterisks as parameter values, that entry must be shown in the **rtrv-scr-aftpc** output with asterisks as the same parameter values specified in the **dlt-scr-aftpc** command.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```

dlt-scr-aftpc:sr=iec:ni=240:nc=010:ncm=010:ssn=012
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
DLT-SCR-AFTPC: SCREEN SET AFFECTED - IEC 25% FULL
DLT-SCR-AFTPC: MASP A - COMPLTD
;

```

dlt-scr-blkdpc**Delete Blocked DPC**

Use this command to remove a specific screening reference from the blocked DPC category. Deleting the last point code (**c-c-c**) also deletes the screening reference.

Keyword: **dlt-scr-blkdpc**

Related Commands: **chg-scr-blkdpc, ent-scr-blkdpc, rtrv-scr-blkdpc**

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:area= (optional)

ITU international area. This parameter specifies the *area* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255** *, C

:id= (optional)

ITU international ID. This parameter specifies the *ID* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7** *, C

:msa= (optional)

24-bit ITU-national main signaling area value. This parameter specifies the *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255** *, C

:nc= (optional)

Network cluster value. This parameter specifies one or more **nc** values for the network indicator and network cluster member values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255** *, C

:ncm= (optional)

Network cluster member value. This parameter specifies one or more **ncm** values for the network indicator and network cluster values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255** *, C

:ni= (optional)

Network indicator value. This parameter specifies one or more **ni** values for the network cluster and network cluster member values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *, C

:npc= (optional)

ITU national point code. An asterisk (*) indicates the full range of values from 0-16383.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: 0-16383 *, C

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:sp= (optional)

24-bit ITU national signaling point. This parameter specifies the *sp* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 0-255.

Range: 0-255 *, C

:ssa= (optional)

24-bit ITU national sub signaling area. This parameter specifies the *ssa* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 0-255.

Range: 0-255 *, C

:zone= (optional)

ITU international zone. This parameter specifies the *zone* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from 0-7.

Range: 0-7 *, C

Example

```
dlt-scr-blkdpc:sr=iec:ni=240:nc=010:ncm=010
```

```
dlt-scr-blkdpc:sr=bdp1:npc=128:pcst=s
```

Dependencies

At least one optional parameter must be specified.

A complete point code must be specified, using the **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or **npc** combination unless a value of **c** for "continue" is specified.

The blocked DPC or blocked DPC range specified by **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or the **npc** parameter must already exist in the specified screening reference.

The point code to delete cannot have the value **c-c-c** if there is another point code in the blocked screen reference. The last screen reference to be deleted must have **ni**, **zone**, **msa**, or **npc** equal to **c**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If **msa=*** is specified, **ssa=*** and **sp=*** must be specified.

If the **msa=c** parameter is specified, then the **ssa** and the **sp** parameters must have a value of **c** or must not be specified. If the **msa=c** parameter is specified, and the **ssa** and the **sp** parameters are not specified, then the **ssa** and **sp** parameters default to a value of **c**.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **ni=c** parameter is specified, then the **nc** and the **ncm** parameters must have a value of **c** or must not be specified. If the **ni=c** parameter is specified, and the **nc** and the **ncm** parameters are not specified, then the **nc** and **ncm** parameters default to a value of **c**.

The last screening reference (**sr**) entry cannot be deleted if it is referenced by another screen.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If the **zone=c** parameter is specified, then the **area** and the **id** parameters must have a value of **c** or must not be specified. If the **zone=c** parameter is specified, and the **area** and the **id** parameters are not specified, then the **area** and **id** parameters default to a value of **c**.

Notes

If the screening reference is not referenced by any other screen, and if all entries are removed, the entire screening reference can be removed using **ni-nc-ncm**, **zone-area-id**, or **msa-ssa-sp** equal to **c-c-c** or **npc=c**. If more than one entry exists, **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or **npc** must not equal **c**.

The asterisk is a parameter value indicating that the gateway screening process is screening all values for that parameter in the MSU. The asterisk parameter value does not mean that multiple entries whose values may be in the range implied by the asterisk will be removed. The only entry that will be removed by this command when the asterisk is specified as a parameter value is the entry that contains an asterisk as that parameter value.

For example, if the **dlt-scr-blkdpc:sr=ied:ni=240:nc=010:ncm=":ssn=*** command is entered, the only entry that will be removed from the database is the entry in screening reference **iec** that contains the values **ni=240**, **nc=010**, **ncm=***, and **ssn=***. For an entry to be specified in this command with asterisks as parameter values, that entry must be shown in the **rtrv-scr-blkdpc** output with asterisks as the same parameter values specified in the **dlt-scr-blkdpc** command.

The asterisk (*) value cannot be specified with the character **c**. For example, a point code **c-c-*** is not allowed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The character **c** is used in the blocked DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked DPC screens. When screening for a blocked DPC and the point code being screened does not match any of the point codes in the blocked DPC screens, the message is not rejected and the screening process continues.

There must be an entry in each unique blocked DPC screening reference to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point

code is in the form of subfields *ni-nc-ncm*, *zone-area-id*, or *msa-ssa-sp* equal to **c-c-c** or **npc=c**. When the character **c** is specified, the **nsfi** and **nsr** parameters must be specified.

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code **c-c-c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
dlt-scr-blkdpc: sr=iec:ni=240:nc=010:ncm=010
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
DLT-SCR-BLKDPC: SCREEN SET AFFECTED - IEC 25% FULL

;
```

dlt-scr-blkopc

Delete Blocked OPC

Use this command to remove a specific screening reference from the blocked OPC category.

Keyword: dlt-scr-blkopc

Related Commands: chg-scr-blkopc, ent-scr-blkopc, rtrv-scr-blkopc

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:area= (optional)

ITU international area. This parameter specifies the *area* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255** *, C

:id= (optional)

ITU international ID. This parameter specifies the *ID* in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7**, *

:msa= (optional)

24-bit ITU-national main signaling area value. This parameter specifies the *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255** *, C

:nc= (optional)

Network cluster value. This parameter specifies one or more **nc** values for the network indicator and network cluster member values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255** *, C

:ncm= (optional)

Network cluster member value. This parameter specifies one or more **ncm** values for the network indicator and network cluster values identified in the **ni** and **nc** parameters. It specifies the *ncm* of

the point code represented by *ni-nc-ncm*. A single value or range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *, C

:ni= (optional)

Network indicator value. This parameter specifies one or more **ni** values for the network cluster and network cluster member values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *, C

:npc= (optional)

ITU national point code. An asterisk (*) indicates the full range of values from **0-16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: 0-16383 *, C

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:sp= (optional)

24-bit ITU national signaling point. This parameter specifies the *sp* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *, C

:ssa= (optional)

24-bit ITU national sub signaling area. This parameter specifies the *ssa* in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *, C

:zone= (optional)

ITU international zone. This parameter specifies the *zone* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: 0-7, *, C

Example

```
dlt-scr-blkopc: sr=iec: ni=240: nc=010: ncm=010
```

```
dlt-scr-blkopc: sr=bop1: npc=128: pcst=s
```

Dependencies

A complete point code must be specified, using the **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or **npc** combination unless a value of **c** for “continue” is specified.

The blocked OPC specified by **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or the **npc** parameter must already exist in the screening reference or within an existing range of OPCs.

The point code to delete cannot have the value **c-c-c** if there is another point code in the blocked screen reference. The last screen reference to be deleted must have **ni**, **zone**, **msa**, or **npc** equal to **c**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If the **msa=c** parameter is specified, then the **ssa** and the **sp** parameters must have a value of **c** or must not be specified. If the **msa=c** parameter is specified, and the **ssa** and the **sp** parameters are not specified, then the **ssa** and **sp** parameters default to a value of **c**.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If the **ni=c** parameter is specified, then the **nc** and the **ncm** parameters must have a value of **c** or must not be specified. If the **ni=c** parameter is specified, and the **nc** and the **ncm** parameters are not specified, then the **nc** and **ncm** parameters default to a value of **c**.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

The Spare Point Code Support feature must be enabled before the **pcst** and **npcst** parameters can be specified.

The last screening reference (**sr**) entry cannot be deleted if it is referenced by another screen.

If the **zone=c** parameter is specified, then the **area** and the **id** parameters must have a value of **c** or must not be specified. If the **zone=c** parameter is specified, and the **area** and the **id** parameters are not specified, then the **area** and **id** parameters default to a value of **c**.

Notes

If the screening reference is not referenced by any other screen, and if all entries are removed, the entire screening reference can be removed using **ni-nc-ncm**, **zone-area-id**, or **msa-ssa-sp** equal to **c-c-c** or **npc=c**. If more than one entry exists, **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or **npc** must not equal **c**.

The asterisk is a parameter value indicating that the gateway screening process is screening all values for that parameter in the MSU. The asterisk parameter value does not mean that multiple entries whose values may be in the range implied by the asterisk will be removed. The only entry that will be removed by this command when the asterisk is specified as a parameter value is the entry that contains an asterisk as that parameter value.

For example, if the **dlt-scr-blkopc:sr=ied:ni=240:nc=010:ncm="" :ssn=*** command is entered, the only entry that will be removed from the database is the entry in screening reference **ied** that contains the values **ni=240**, **nc=010**, **ncm=***, and **ssn=***. For an entry to be specified in this command with asterisks as parameter values, that entry must be shown in the **rtrv-scr-blkopc** output with asterisks as the same parameter values specified in the **dlt-scr-blkopc** command.

The asterisk (*) value cannot be specified with the character **c**. For example, a point code **c-c-*** is not allowed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The character **c** is used in the blocked OPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked OPC screens. When screening for a blocked OPC and the point code being screened does not match any of the point codes in the blocked DPC screens, the message is not rejected and the screening process continues.

There must be an entry in each unique blocked OPC screening reference to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code is either **npc=c**, or in the form of subfields *ni-nc-ncm*, *zone-area-id*, or *msa-ssa-sp* equal to **c-c-c**. When the character **c** is specified, the **nsfi** and **nsr** must be specified.

When the point code does not match any entries in the blocked OPC screens, the screening process is directed to the screening reference with the point code **c-c-c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
dlt-scr-blkopc: sr=iec: ni=240: nc=010: ncm=010

dlt-scr-cdpa

Delete Allowed Called Party Address

Use this command to remove a specific screening reference from the allowed called party address category.

Keyword: dlt-scr-cdpa

Related Commands: chg-scr-cdpa, ent-scr-cdpa, rtrv-scr-cdpa

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:ssn= (mandatory)

Subsystem number. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:area= (optional)

ITU international area. This parameter specifies the *area* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 *, C**

:id= (optional)

ITU international ID. This parameter specifies the *ID* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7, ***

:msa= (optional)

24-bit ITU national signaling point. This parameter specifies the *msa* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *

:nc= (optional)

Network cluster value. This parameter specifies one or more **nc** values for the network indicator and network cluster member values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *

:ncm= (optional)

Network cluster member value. This parameter specifies one or more **ncm** values for the network indicator and network cluster member values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *

:ni= (optional)

Network indicator value. This parameter specifies one or more **ni** values for the network cluster and network cluster member values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *

:npc= (optional)

ITU national point code. An asterisk (*) indicates the full range of values from **0-16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: 0-16383 *, C

:pct= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:scmgfid= (optional)

SCCP management format ID. This parameter consists of a one-octet field and uniquely defines the function and format of each SCMG message. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **1-255**.

Range: 1-255 *

:sp= (optional)

24-bit ITU national signaling point. This parameter specifies the *sp* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *

:ssa= (optional)

24-bit ITU national sub signaling area. This parameter specifies the *ssa* in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *

:zone= (optional)

ITU international zone. This parameter specifies the *zone* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: 0-7, *, C

Example

```
dlt-scr-cdpa:sr=iec:ni=240:nc=010:ncm=010:ssn=012
```

```
dlt-scr-
```

```
cgpa:sr=cgpa:zone=1:area=2:id=3:ssn=1:sccpmt=9:ri=*:pcst=s
```

Dependencies

A complete point code must be specified, and must be one and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**, except in the special case of entering **c** for "continue."

The CDPA point code, **ssn**, and **scmgfid** to be removed must exist in the CDPA entity set.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

The specified screening reference (**sr**) must already exist in the database.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

A CDPA screening reference (**sr**) cannot be deleted if it referenced by an entity in another screening set.

If the **ssn** parameter is a value other than **1**, the **scmgfid** parameter cannot be specified.

If the **ssn=1** parameter is specified, the **scmgfid** parameter must be specified.

Notes

If only one entry exists and is not referenced by another screening table, the entire screening table is removed.

The asterisk is a parameter value indicating that the gateway screening process is screening all values for that parameter in the MSU. The asterisk parameter value does not mean that multiple entries whose values may be in the range implied by the asterisk will be removed. The only entry that will be removed by this command when the asterisk is specified as a parameter value is the entry that contains an asterisk as that parameter value.

For example, if the **dlt-scr-cdpa:sr=ied:ni=240:nc=010:ncm="":ssn=*** command is entered, the only entry that will be removed from the database is the entry in screening reference **ied** that contains the values **ni=240**, **nc=010**, **ncm=***, and **ssn=***. For an entry to be specified in this command with asterisks as parameter values, that entry must be shown in the **rtrv-scr-cdpa** output with asterisks as the same parameter values specified in the **dlt-scr-cdpa** command.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
dlt-scr-cdpa: sr=iec: ni=240: nc=010: ncm=010: ssn=012
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
DLT-SCR-CDPA: SCREEN SET AFFECTED - IEC 25% FULL
DLT-SCR-CDPA: MASP A - COMPLTD
;
```

dlt-scr-cgpa

Delete Allowed Calling Party Address

Use this command to remove a specific screening reference from the allowed calling party address category.

Keyword: dlt-scr-cgpa

Related Commands: chg-scr-cgpa, ent-scr-cgpa, rtrv-scr-cgpa

Command Class: Database Administration

Parameters

:ri= (mandatory)

Routing indicator. This parameter specifies routing instructions to the receiving signaling point. In gateway screening, messages may be screened based on the value of the routing indicator.

Range: dpc, gt, *

dpc — Allow a called party address with a routing indicator value of “DPC/SSN.”

gt — Screening stops and gateway screening is bypassed as a forced pass.

***** — Allow both routing indicator values.

:sccpmt= (mandatory)

SCCP message type. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values.

Range: 9, 10, 17, 18, *

9, * — UDT

10, * — UDTS

17, * — XUDT

18, * — XUDTS

:sr= (mandatory)

Screening reference. This parameter specifies the point code’s unique screening reference name.

Range: ayy

1 alphabetic character followed by up to 3 alphanumeric characters

:ssn= (mandatory)

Subsystem number. An asterisk (*) indicates the full range of values from **1-255**.

Range: 1-255 *

:area= (optional)

ITU international area. This parameter specifies the *area* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *

:id= (optional)

ITU international ID. This parameter specifies the *ID* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7, ***

:msa= (optional)

24-bit ITU-national main signaling area value. This parameter specifies the *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:nc= (optional)

Network cluster value. This parameter specifies one or more **nc** values for the network indicator and network cluster member values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:ncm= (optional)

Network cluster member value. This parameter specifies one or more **ncm** values for the network indicator and network cluster values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:ni= (optional)

Network indicator value. This parameter specifies one or more **ni** values for the network cluster and network cluster member values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:npc= (optional)

ITU national point code. An asterisk (*) indicates the full range of values from **0-16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: **0-16383 ***

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: **none, s**

Default: **none**

:sp= (optional)

24-bit ITU national signaling point. This parameter specifies the *sp* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:ssa= (optional)

24-bit ITU national sub signaling area. This parameter specifies the *ssa* in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:zone= (optional)

ITU international zone. This parameter specifies the *zone* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7,***

Example

```
dlt-scr-cgpa:sr=iec:ni=240:nc=010:ncm=010:ssn=012
```

```
dlt-scr-cgpa:sr=cdp1:ni=5:nc=5:ncm=5:ssn=1:ri=dpc:sccpmt=009
```

```
dlt-scr-
```

```
cgpa:sr=cgpa:zone=1:area=2:id=3:ssn=1:sccpmt=9:ri=*:pcst=s
```

Dependencies

A complete point code must be specified, and must be one, and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp** ; or **npc**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

The CGPA point code, **ri**, **ssn**, and **sccpmt** to be removed must exist in the CGPA entity set.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

The specified screening reference (**sr**) must already exist in the database.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

A CGPA screening reference (**sr**) cannot be deleted if it is referenced by an entity in another screening set.

Notes

The asterisk is a parameter value indicating that the gateway screening process is screening all values for that parameter in the MSU. The asterisk parameter value does not mean that multiple entries whose values may be in the range implied by the asterisk will be removed. The only entry that will be removed by this command when the asterisk is specified as a parameter value is the entry that contains an asterisk as that parameter value.

For example, if the **dlt-scr-cgpa:sr=ied:ni=240:nc=010:ncm="":ssn=*** command is entered, the only entry that will be removed from the database is the entry in screening reference **ied** that contains the values **ni=240**, **nc=010**, **ncm=***, and **ssn=***. For an entry to be specified in this command with asterisks as parameter values, that entry must be shown in the **rtrv-scr-cgpa** output with asterisks as the same parameter values specified in the **dlt-scr-cgpa** command.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The routing indicator in the calling party address provides routing instructions for the receiving signaling point. When the routing indicator specifies global title, the message is routed based on the global title digits. If the routing indicator specifies DPC, the message is routed based on the DPC/subsystem number in the calling party address.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pct** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
dlt-scr-cgpa: sr=iec: ni=240: nc=010: ncm=010: ssn=012
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
DLT-SCR-CGPA: SCREEN SET AFFECTED - IEC 25% FULL
DLT-SCR-CGPA: MASP A - COMPLTD
;
```

dlt-scr-destfld

Delete an Allowed DESTFLD

Use this command to remove a specific screening reference from the allowed affected destination field (DESTFLD) category.

Keyword: **dlt-scr-destfld**

Related Commands: **chg-scr-destfld, ent-scr-destfld, rtrv-scr-destfld**

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:area= (optional)

ITU international area. This parameter specifies the *area* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:id= (optional)

ITU international ID. This parameter specifies the *ID* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7, ***

:msa= (optional)

24-bit ITU-national main signaling area value. This parameter specifies the *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:nc= (optional)

Network cluster value. This parameter specifies one or more **nc** values for the network indicator and network cluster member values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:ncm= (optional)

Network cluster member value. This parameter specifies one or more **ncm** values for the network indicator and network cluster values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

:ni= (optional)

Network indicator value. This parameter specifies one or more **ni** values for the network cluster and network cluster member values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

:npc= (optional)

ITU national point code. An asterisk (*) indicates the full range of values from **0–16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: **0-16383 ***

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: **none, s**

Default: **none**

:sp= (optional)

24-bit ITU national signaling point. This parameter specifies the *sp* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

:ssa= (optional)

24-bit ITU national sub signaling area. This parameter specifies the *ssa* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

:zone= (optional)

ITU international zone. This parameter specifies the *zone* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7, ***

Example

```
dlt-scr-destfld:sr=iec:ni=240:nc=010:ncm=010
```

```
dlt-scr-destfld:sr=dst1:zone=1:area=2:id=3:pcst=s
```

Dependencies

A complete point code must be specified, using the **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or **npc** combination unless a value of **c** for “continue” is specified.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If the **zone=*** parameter is specified, then the **area=*** and the **id=*** parameters must be specified.

If the **area=*** parameter is specified, then the **id=*** parameter must be specified.

If the **ssa=*** parameter is specified, then the **sp=*** parameter must be specified.

If the **msa=*** parameter is specified, then the **ssa=*** and the **sp=*** parameters must be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

The DESTFLD specified by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must already exist in the screening reference.

If only one entry exists, the **sr** must not be referenced by another screening table. If the **sr** is not referenced by another screening table, the entire screening table is deleted.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If the **nsfi=fail** parameter is specified, then the **nni**, **nc**, **ncm**, **narea**, **nzone**, **nid**, **nmsa**, **nssa**, **nsp**, and **npc** parameters cannot have a value of **c**.

Notes

The asterisk is a parameter value indicating that the gateway screening process is screening all values for that parameter in the MSU. The asterisk parameter value does not mean that multiple entries whose values may be in the range implied by the asterisk will be removed. The only entry that will be removed by this command when the asterisk is specified as a parameter value is the entry that contains an asterisk as that parameter value.

For example, if the **dlt-scr-destfld:sr=ied:ni=240:nc=010:ncm="":ssn=*** command is entered, the only entry that will be removed from the database is the entry in screening reference **iec** that contains the values **ni=240**, **nc=010**, **ncm=***, and **ssn=***. For an entry to be specified in this command with asterisks as parameter values, that entry must be shown in the **rtrv-scr-destfld** output with asterisks as the same parameter values specified in the **dlt-scr-destfld** command.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
dlt-scr-destfld:sr=iec:ni=240:nc=010:ncm=010
```

```
rlghncxa03w 04-02-13 11:49:47 EST EAGLE 31.3.0

dlt-scr-dpc**Delete Allowed DPC**

Use this command to remove a specific screening reference from the allowed DPC category.

Keyword: **dlt-scr-dpc**

Related Commands: **chg-scr-dpc, ent-scr-dpc, rtrv-scr-dpc**

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:area= (optional)

ITU international area. This parameter specifies the *area* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:id= (optional)

ITU international ID. This parameter specifies the *ID* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7 ***

:msa= (optional)

24-bit ITU-national main signaling area value. This parameter specifies the *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:nc= (optional)

Network cluster value. This parameter specifies one or more **nc** values for the network indicator and network cluster member values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:ncm= (optional)

Network cluster member value. This parameter specifies one or more **ncm** values for the network indicator and network cluster values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:ni= (optional)

Network indicator value. This parameter specifies one or more **ni** values for the network cluster and network cluster member values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:npc= (optional)

ITU national point code. An asterisk (*) indicates the full range of values from **0-16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes,

see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: 0-16383 *

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:sp= (optional)

24-bit ITU national signaling point. This parameter specifies the *sp* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 0-255.

Range: 0-255 *

:ssa= (optional)

24-bit ITU national sub signaling area. This parameter specifies the *ssa* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 0-255.

Range: 0-255 *

:zone= (optional)

ITU international zone. This parameter specifies the *zone* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from 0-7.

Range: 0-7, *

Example

```
dlt-scr-dpc: sr=iec: ni=240: nc=010: ncm=010
```

```
dlt-scr-dpc: sr=dpc1: npc=128: pcst=s
```

Dependencies

A complete point code must be specified, using the **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or **npc** combination unless a value of **c** for "continue" is specified.

The DPC specified by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must already exist in the screening reference or within an existing range of DPCs.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range 000-255

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range 000-255.

If the **ncm** parameter is specified as a single value, or a range other than the full range of 000-255, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range 000-255.

If only one entry exists, the **sr** must not be referenced by another screening table. If the **sr** is not referenced by another screening table, the entire screening table is deleted.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If the **nsfi=fail** parameter is specified, then the **nni**, **nc**, **nncm**, **narea**, **nzone**, **nid**, **nmsa**, **nssa**, **nsp**, and **npc** parameters cannot have a value of **c**.

Notes

The asterisk is a parameter value indicating that the gateway screening process is screening all values for that parameter in the MSU. The asterisk parameter value does not mean that multiple entries whose values may be in the range implied by the asterisk will be removed. The only entry that will be removed by this command when the asterisk is specified as a parameter value is the entry that contains an asterisk as that parameter value.

For example, if the **dlt-scr-dpc:sr=iec:ni=240:nc=010:nccm=":ssn=*** command is entered, the only entry that will be removed from the database is the entry in screening reference **iec** that contains the values **ni=240**, **nc=010**, **nccm=***, and **ssn=***. For an entry to be specified in this command with asterisks as parameter values, that entry must be shown in the **rtrv-scr-dpc** output with asterisks as the same parameter values specified in the **dlt-scr-dpc** command.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
dlt-scr-dpc:sr=iec:ni=240:nc=010:nccm=010
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
DLT-SCR-DPC: SCREEN SET AFFECTED - IEC 25% FULL
DLT-SCR-DPC: MASP A - COMPLTD
;
```

dlt-scr-isup

Delete Allowed ISUP Screening Reference

Use this command to delete an allowed ISUP screening reference from the Allowed ISUP entity set.

Keyword: **dlt-scr-isup**

Related Commands: **chg-scr-isup**, **ent-scr-isup**, **rtrv-scr-isup**

Command Class: Database Administration

Parameters

:isupmt/tupmt= (mandatory)

ISUP or TUP message type. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255**

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Example

```
dlt-scr-isup:sr=iec:isupmt=9
dlt-scr-isup:sr=iec:isupmt=1&&2
dlt-scr-isup:tupmt=1:sr=tu01
```

Dependencies

The specified **sr** must exist in the Allowed ISUP entity set.

The specified **isupmt** parameter or **tupmt** parameter value must already exist in the specified **sr**.

The last entry in the specified **sr** cannot be deleted if the entry is referenced by another screen.

Notes

An asterisk can be specified for a parameter value in the **chg-scr-isup** and **dlt-scr-isup** commands *only* if that parameter value was specified as an asterisk in the **ent-scr-isup** command to define the parameter value.

A range of values can be specified for the **isupmt** parameter or **tupmt** parameter, by separating the values that define the range by two ampersands (**&&**); for example, **:isupmt=025&&100** specifies all ISUP message types from **25** to **100**. The value to the left of the **&&** must be less than the value to the right of the **&&** in the range.

Output

No screen sets are listed in the following example, because the specified screening reference is not associated with any screen sets.

```
dlt-scr-isup:sr=iec:isupmt=9
tekelecstp 02-09-02 11:59:41 EST EAGLE 30.0.0
DLT-SCR-ISUP: MASP A - COMPLTD
;
```

No screen sets are listed in the following example, because the specified screening reference is not associated with any screen sets.

```
dlt-scr-isup:sr=iec:isupmt=1&&2
tekelecstp 02-09-02 12:00:30 EST EAGLE 30.0.0
DLT-SCR-ISUP: MASP A - COMPLTD
;
```

The following example lists the screen sets that are associated with the specified screening reference.

```
dlt-scr-isup:tupmt=1:sr=tu01
tekelecstp 03-11-02 12:00:30 EST EAGLE 31.3.0
Extended Processing Time Required -- Please Wait
Notice: The number of screensets affected is 2.
DLT-SCR-ISUP: SCREEN SET AFFECTED - ist1 1% FULL
DLT-SCR-ISUP: SCREEN SET AFFECTED - ist2 1% FULL
DLT-SCR-ISUP: MASP A - COMPLTD
;
```

dlt-scr-opc

Delete Allowed OPC

Use this command to remove a specific screening reference from the allowed OPC category.

Keyword: **dlt-scr-opc**

Related Commands: **chg-scr-opc**, **ent-scr-opc**, **rtrv-scr-opc**

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

- :area=** (optional)
ITU international area. This parameter specifies the *area* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-255**.
Range: 0-255 *
- :id=** (optional)
ITU international ID. This parameter specifies the *ID* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.
Range: 0-7 *
- :msa=** (optional)
24-bit ITU-national main signaling area value. This parameter specifies the *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.
Range: 0-255 *
- :nc=** (optional)
Network cluster value. This parameter specifies one or more **nc** values for the network indicator and network cluster member values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.
Range: 0-255 *
- :ncm=** (optional)
Network cluster member value. This parameter specifies one or more **ncm** values for the network indicator and network cluster member values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.
Range: 0-255 *
- :ni=** (optional)
Network indicator value. This parameter specifies one or more **ni** values for the network cluster and network cluster member values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.
Range: 0-255 *
- :npc=** (optional)
ITU national point code. An asterisk (*) indicates the full range of values from **0-16383**.
Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.
Range: 0-16383 *
- :pct=** (optional)
Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).
Range: none, s
Default: none
- :sp=** (optional)
24-bit ITU national signaling point. This parameter specifies the *sp* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.
Range: 0-255 *

:ssa= (optional)

24-bit ITU national sub signaling area. This parameter specifies the *ssa* in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255 ***

:zone= (optional)

ITU international zone. This parameter specifies the *zone* in the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7, ***

Example

```
dlt-scr-opc:sr=iec:ni=240:nc=010:ncm=010
```

```
dlt-scr-opc:sr=opc1:npc=128:pcst=s
```

Dependencies

A complete point code must be specified, using the **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or **npc** combination unless a value of **c** for “continue” is specified.

The OPC specified by **ni-nc-ncm**; **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must already exist in the screening reference or within an existing range of OPCs.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If only one entry exists, the **sr** must not be referenced by another screening table. If the **sr** is not referenced by another screening table, the entire screening table is deleted.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If the **nsfi=fail** parameter is specified, then the **nni**, **nc**, **ncm**, **narea**, **nzone**, **nid**, **nmsa**, **nssa**, **nsp**, and **npc** parameters cannot have a value of **c**.

Notes

The asterisk is a parameter value indicating that the gateway screening process is screening all values for that parameter in the MSU. The asterisk parameter value does not mean that multiple entries whose values may be in the range implied by the asterisk will be removed. The only entry that will be removed by this command when the asterisk is specified as a parameter value is the entry that contains an asterisk as that parameter value.

For example, if the **dlt-scr-dpc:sr=ied:ni=240:nc=010:ncm="" :ssn=*** command is entered, the only entry that will be removed from the database is the entry in screening reference **ied** that contains the values **ni=240**, **nc=010**, **ncm=***, and **ssn=***. For an entry to be specified in this command with

asterisks as parameter values, that entry must be shown in the **rtrv-scr-dpc** output with asterisks as the same parameter values specified in the **dlt-scr-dpc** command.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
dlt-scr-opc:sr=iec:ni=240:nc=010:ncm=010
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
DLT-SCR-OPC: SCREEN SET AFFECTED - IEC 25% FULL
DLT-SCR-OPC: MASP A - COMPLTD
;
```

dlt-scr-sio

Delete Allowed SIO

Use this command to remove a specific screening reference from the allowed service indicator octet (SIO) category.

Keyword: **dlt-scr-sio**

Related Commands: **chg-scr-sio**, **ent-scr-sio**, **rtrv-scr-sio**

Command Class: Database Administration

Parameters

:nic= (mandatory)

Network indicator code. This parameter specifies whether the message originated from an international (**0**) or national (**2**) network. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-3**.

Range: **0-3 ***

:pri= (mandatory)

New message priority. This parameter specifies the new message priority in the SIO. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-3**.

Range: **0-3 ***

Default: Current value

:si= (mandatory)

Service indicator. The service indicator identifies the type of message. The values are defined in Telcordia TR-NWT-000246.

Range: **00, 01- 15**

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:h0= (optional)

This parameter is mandatory if the **si** value is **00**, **01**, **02**, or **03**. Otherwise, the **h0** parameter is undefined.

Range: **0-15 ***

Default: Current value or undefined

:h1= (optional)

This parameter is mandatory if the **si** value is **00**, **01**, **02**, or **03**. Otherwise, the **h1** parameter is undefined.

Range: 0-15 *

Default: Current value or undefined

Example

```
dlt-scr-sio:sr=iec:nic=1:si=1:h0=4:h1=2:pri=*
```

```
dlt-scr-sio:sr=iec:nic=1:si=3:pri=2
```

Dependencies

The **nh0** and **nh1** parameters cannot be specified if the **nsi** parameter is specified and is not equal to **00**, **01**, or **02**.

The **sr**, **nic**, **si**, **pri**, and **h0/h1** parameters to be removed must be in the screening reference.

Valid combinations for the **h0/h1** and **nh0/nh1** parameters are:

- **h0 (nh0)** is a single value—**h1 (nh1)** can be a single value, range, or an asterisk (*) entry
- **h0 (nh0)** is a range—**h1 (nh1)** can be an asterisk (*) entry
- **h0 (nh0)** is an asterisk (*) entry—**h1 (nh1)** can be an asterisk (*) entry

The **sr**, **nic**, **si**, **pri**, and **h0/h1** parameters cannot be removed if they are the last entry in the screening reference and the screening reference is part of a screen set.

If the **si** parameter is equal to **00**, **01**, or **02**, the **h0** and **h1** parameters must be specified. Otherwise, the **h0** parameter cannot be specified.

If the value of the **si** parameter is greater than **2**, then the **h0** and **h1** parameters cannot be specified.

If asterisks or ranges are specified for the heading codes, nothing that matches the combination of **nic**, **si**, and the specified heading codes can already exist in the allowed SIO entity set for the screening reference.

The specified screening reference (**sr**) must already exist in the database.

Notes

The network identifier specifies whether the message originated from an international (**0**) or a national (**2**) network.

The asterisk is a parameter value indicating that the gateway screening process is screening all values for that parameter in the MSU. The asterisk parameter value does not mean that multiple entries whose values may be in the range implied by the asterisk will be removed. The only entry that will be removed by this command when the asterisk is specified as a parameter value is the entry that contains an asterisk as that parameter value.

For example, if the **dlt-scr-sio:sr=ied:ni=240:nc=010:nccm='':ssn=*** command is entered, the only entry that will be removed from the database is the entry in screening reference **ied** that contains the values **ni=240**, **nc=010**, **nccm=***, and **ssn=***. For an entry to be specified in this command with asterisks as parameter values, that entry must be shown in the **rtrv-scr-sio** output with asterisks as the same parameter values specified in the **dlt-scr-sio** command.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

Output

```

dlt-scr-sio:sr=iec:nic=1:si=3:pri=2
  rlghncxa03w 04-02-14 16:45:50 EST  EAGLE 31.3.0
  DLT-SCR-SIO: SCREEN SET AFFECTED - SS01 25% FULL
  DLT-SCR-SIO: SCREEN SET AFFECTED - SS04 35% FULL
  DLT-SCR-SIO: MASP A - COMPLTD
;

```

dlt-scr-tt**Delete Allowed Translation Type**

Use this command to remove a specific screening reference from the allowed translation type category.

Keyword: dlt-scr-tt

Related Commands: chg-scr-tt, ent-scr-tt, rtrv-scr-tt

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:type= (mandatory)

Translation type. This parameter specifies the GTT type value in the CdPA. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **0-255** *, && (Allow intervals)

Example

```
dlt-scr-tt:sr=iec:type=012
```

Dependencies

The screening reference must exist.

You cannot remove the **sr** and **type** parameters if they are the last entry in the screening reference and the screening reference is part of a screen set.

The allowed **type** to be removed must already exist in the screening reference.

The single value or range specified for the allowed **type** to be deleted from the TT screen for the allowed TT screening reference must already exist in that TT screen.

The value specified for the **type** parameter must be within the allowed range.

Notes

The asterisk is a parameter value indicating that the gateway screening process is screening all values for that parameter in the MSU. The asterisk parameter value does not mean that multiple entries whose values may be in the range implied by the asterisk will be removed. The only entry that will be removed by this command when the asterisk is specified as a parameter value is the entry that contains an asterisk as that parameter value.

For example, if the **dlt-scr-tt:sr=ied:type=":ssn=*** command is entered, the only entry that will be removed from the database is the entry in screening reference **ied** that contains an asterisk as the value for the **type** parameter. For an entry to be specified in this command with an asterisk as the value for the **type** parameter, that entry must be shown in the **rtrv-scr-tt** output with an asterisk as the value for the **type** parameter.

Output

```

dlt-scr-tt:sr=iec:type=012
  rlgncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
  DLT-SCR-TT: SCREEN SET AFFECTED - IEC 25% FULL
  DLT-SCR-TT: MASP A - COMPLTD
;

```

dlt-scrset**Delete Screen Set**

Use this command to remove a screen set definition from the database. A screen set is a group of screening references that belong to various categories. This command does not remove any gateway screening tables.

Keyword: **dlt-scrset**

Related Commands: **chg-scrset, ent-scrset, rtrv-scrset**

Command Class: Database Administration

Parameters

:scrn= (mandatory)

Screen set name. Each screening reference must have a unique name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Example

```

dlt-scrset:scrn=nc27

```

Dependencies

The screen set name must exist.

Before the screen set can be removed, it must be removed from all linksets.

Notes

The system validates the command to ensure that the specified screen set name is in use.

Output

```

dlt-scrset:scrn=nc27
  rlgncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
  DLT-SCRSET: MASP A - COMPLTD
;

```

dlt-shlf**Delete Shelf**

Use this command to remove a shelf from the system database.

Keyword: **dlt-shlf**

Related Commands: **ent-shlf, rtrv-shlf**

Command Class: Database Administration

Parameters

:loc= (mandatory)

Location of the shelf to be deleted.

Range: **1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100**

Example

```
dlt-shlf:loc=2300
```

Dependencies

The equipment shelf must have been configured previously.

The specified shelf cannot have any configured cards.

If the equipment shelf is the only provisioned shelf in the frame and a frame power threshold entry is configured in the Frame Power Threshold table for the frame, the shelf cannot be deleted until the frame power threshold entry is deleted from the Frame Power Threshold table.

Notes

All shelves in the system can be removed, except the control shelf (**1100**).

Before a shelf can be removed from the database, all SS7 signaling links and TCP/IP data links must be deactivated and removed from the database, all TSMs must be placed out of service, and all cards in the shelf must be removed from the database. See the *Database Administration Manual - System Management* for more information on shelf removal.

Refer to the *Installation - EAGLE 5 ISS* manual for an illustration of shelf locations.

Output

```
dlt-shlf:loc=2300
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
DLT-SHLF: MASP A - COMPLTD
;
```

dlt-slk**Delete Signaling Link**

Use this command to remove a signaling link from the system database.

Keyword: dlt-slk

Related Commands: act-slk, blk-slk, chg-lsopts, dact-slk, ent-slk, inh-slk, rept-stat-slk, rtrv-slk, tst-slk, ublk-slk, unhb-slk

Command Class: Database Administration

Parameters

:link= (mandatory)

Signaling link on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

Synonym: port

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:force= (optional)

This parameter must be used to remove the last link in a linkset without having to remove all of the routes that referenced the linkset.

Range: **yes, no**

Default: **no**

Example

```
dlt-slk:loc=1211:link=a
```

```
dlt-slk:loc=1201:link=b:force=yes
```

Dependencies

Card locations **1113** through **1118** cannot be specified.

The frame and shelf portions of the specified card location (**loc**) can be **11** through **13**, **21** through **23**; **31** through **33**; **41** through **43**; **51** through **53**; and **61**. (The card location is *xyss*, where *x* is the frame, *y* is the shelf, and *ss* is the slot.)

Links **a16-a31** and **b16-b31** cannot be specified for even-numbered card locations. HC MIM cards are dual-slot cards. The links are assigned only to the cards in odd-numbered locations.

The specified link must exist in the database.

The signaling link must be in the unavailable (UAV) state before it can be removed. Enter the **rept-stat-slk** command to verify the state of the signaling link.

The signaling link cannot have an active LFS test in progress when this command is entered to delete the link.

The **force=yes** parameter must be specified to remove the last signaling link in a linkset that is assigned to a route.

To remove the last signaling link on a card, the state of the card must be OOS-MT-DSBLD. Enter the **rept-stat-card** command to verify the state of the card.

The card must be inhibited before the last link on the card can be deleted.

An IPLIMx or IPGWx signaling link assigned to a local host cannot be deleted if it has a socket or association with connection status **open=yes**.

The slot portion of the specified card location (**loc**) can be **1** through **8** and **11** through **18**. Slots **09** and **10** cannot be specified. (The card location is *xyss*, where *x* is the frame, *y* is the shelf, and *ss* is the slot.)

If deleting the link causes the provisioned link count to fall below the **numslk** thresholds configured for the corresponding IPSPG-M3UA linkset (see the **chg-lsopts** command), then the command cannot be entered. If values of **0** or **1** are specified for all of the **numslk** threshold parameters, then the last link can be deleted.

If the **lsrestrict=on** parameter is specified (see the **chg-ss7opts** command), and if deleting the link would send the number of links assigned to the linkset below the value specified for the **tfatcabmlq** parameter (see the **chg-ls** command), then the link cannot be deleted.

Notes

This command disassociates the equipment of a link from a logical signaling link. The link must first be placed in the unavailable (UAV) state by entering the **chg-slk** (or **canc-slk**) command before this command can be used to disconnect it. Entering this command results in the link entity being deleted from the STP's link entity set. The link is then considered to be "disconnected." The link on the STP becomes unassigned (spare) but retains the existing equipment type and options; the link remains in the "equipped" provisioning state unless that state is changed by subsequent local craft activity. The link is also no longer associated with its assigned linkset.

Not every card location represents a signaling link. Be sure to address a signaling link in this command.

The *Installation Manual – EAGLE 5 ISS* provides an illustration of card locations.

Signaling links and scheduled UI measurement reports

If the Integrated Measurements feature is turned on, the measurements subsystem is provisioned (see the **chg-measopts** command), and the latest deletion causes the provisioned link count to fall to 700, then the measurements subsystem automatically enables the scheduled UI measurements report.

Output

```
dlt-slk:loc=1211:link=a
  rlgncxa03w 05-02-07 11:11:28 EST EAGLE5 33.0.0
  DLT-SLK: MASP A - COMPLTD
;
```

dlt-spc

Delete Secondary Point Code

Use this command to delete an SPC (secondary point code) from the database. Also use this command to change an SPC by first removing the SPC from the database and then using the **ent-spc** command to enter the new SPC value.

Keyword: dlt-spc

Related Commands: ent-spc, rtrv-spc

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" in Appendix A for a detailed description of point code formats, rules for specification, and examples.

:spc= (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: spca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.

The point code **000-000-000** is not a valid point code.

:spc/spca/spci/spcn/pcn24= (mandatory)

Secondary point code.

:spci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:spcn= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (prefix-zone-area-id).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:spcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

Example

d1t-spc: spc=10-20-30

d1t-spc: spcn24=98-98-98

d1t-spc: spcn=s-12345

Dependencies

A secondary point code that is referenced in the Destination table cannot be deleted.

If the value specified for the **spc** parameter is referenced in the Linkset table, then the parameter cannot be deleted.

The MPC feature must be turned on before this command can be entered.

The value specified for the **spc** parameter must exist in the Secondary Point Code table.

Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Output

d1t-spc: spc=10-20-30

```
rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0
Secondary Point Code table is (7 of 40) 17% full
DLT-SPC: MASP A - COMPLTD
```

;

dlt-srvsel**Delete Service Selector**

Use this command to delete a service selector.

Keyword: dlt-srvsel

Related Commands: chg-srvsel, ent-srvsel, rtrv-srvsel

Command Class: Database Administration

Parameters

NOTE: The nature of address indicator parameters (naiv or nai) can be specified using a mnemonic or an explicit value. Either value can be specified; however, both values cannot be specified at the same time for the same parameter. Table A-7 shows the mapping between the naiv and the nai parameter values.

NOTE: The numbering plan parameters (npv or np) can be specified using a mnemonic or an explicit value. Either value can be specified; however, both values cannot be specified at the same time for the same parameter. Table A-8 shows the mapping between the npv and the np parameter values.

:gti/gtia/gtii/gtin/gtin24= (mandatory)

Global title indicator. For all service selector commands, the domain is defined as **gti** and **gtia** (ANSI), **gtii** (ITU international), and **gtin** (ITU national). For the service selector commands, **gti** and **gtia** are equivalent.

Range: 2, 4

Supported value for ANSI: **gti=2** and **gtia=2**

Supported values for ITU: **gtii=2, gtii=4, gtin=2, gtin=4, gtin24=2, gtin24=4**

:ssn= (mandatory)

Subsystem number.

Range: 0-255 *

:tt= (mandatory)

Translation type.

Range: 0-255

:nai= (optional)

Nature of Address indicator.

Range: sub, rsvd, natl, intl

:naiv= (optional)

Nature of Address indicator value.

Range: 0-127

:np= (optional)

Numbering Plan.

Range: e164, generic, x121, f69, e210, e212, e214, private

:npv= (optional)

Numbering Plan value.

Range: 0-15

Example

```
dlt-srvsel:gti=2:ssn=250:tt=10
```

```
dlt-srvsel:gtin=4:tt=0:ssn=100:np=e164:nai=sub
```

```
dlt-srvsel:gtin24=4:tt=4:ssn=20:np=e164:nai=intl
```

```
dlt-srvsel:gtii=4:tt=4:np=e164:nai=intl:ssn=9
dlt-srvsel:gtii=4:tt=5:np=e164:nai=intl:ssn=*
```

Dependencies

The **np** and **npv** parameters cannot be specified together in the command.

The **nai** and **naiv** parameters cannot be specified together in the command.

The **gti=4** and **gtia=4** parameters cannot be specified. The value **4** is not valid for these parameters.

The values **1** and **3** are not valid for the **gti/gtia/gtii/gtin/gtin24** parameters.

If the **gtii/gtin/gtin24=4** parameter is specified, then an **np(v)** and **nai(v)** parameter combination must be specified. These parameters can be specified in the following combinations: **np** and **naiv**, **npv** and **nai**, **np** and **nai**, or **npv** and **naiv**.

If the **gti/gtia/gtii/gtin/gtin24=2** parameter is specified, no **np(v)** and **nai(v)** parameter combinations can be specified.

An entry must already exist that matches the **gti/gtia/gtii/gtin/gtin24**, **tt**, **ssn**, and **np(v)** and **nai(v)** combination of parameters.

Notes

None

Output

```
dlt-srvsel:gti=2:ssn=250:tt=10
rlghncxa03w 07-10-05 16:40:40 EST EAGLE 37.5.0
Service Selector table is (114 of 1024) 11% full
DLT-SRVSEL: MASP A - COMPLTD
;
```

dlt-ss-appl

Delete Subsystem Application

Use this command to remove the application from the database.

Keyword: **dlt-ss-appl**

Related Commands: **chg-ss-appl**, **ent-ss-appl**, **rtrv-ss-appl**

Command Class: Database Administration

Parameters

:appl= (mandatory)

Application type.

Range: **lnp**, **inp**, **eir**, **vflex**, **atinpq**, **aiq**

Example

```
dlt-ss-appl:appl=inp
```

Dependencies

The LNP feature must be turned on before the **appl=lnp** parameter can be specified.

The INP feature must be turned on before the **dlt-ss-appl:appl=inp** command can be entered.

The Equipment Identity Register (EIR) feature must be turned on before the **dlt-ss-appl:appl=eir** command can be entered.

The value specified for the **appl** parameter must already exist in the SS-APPL table.

The subsystem must be inhibited before **status=offline** can be specified.

Application type must exist in the LNP database (non DBS 1.0 only)

The V-Flex feature must be turned on before the **appl=vflex** parameter can be specified.
 The ATINP feature must be enabled before the **appl=atinpq** parameter can be entered.
 The ANSI41 AIQ feature must be enabled before the **appl=aiq** parameter can be specified.

Notes

When a subsystem application is deleted, the following message is displayed:

CAUTION: DELETED APPL SSN MAY BE REFERENCED BY GTT ENTRY

Output

```
dlt-ss-appl:appl=aiq
tekelecstp 09-12-03 17:34:20 EST EAGLE 42.0.0
DLT-SS-APPL: MASP A - CAUTION: DELETED APPL SSN MAY BE REFERENCED BY GTT
ENTRY
DLT-SS-APPL: MASP A - COMPLTD
;
```

dlt-subnetid

Delete Subnet ID

Use this command to delete a Subnet ID entry from the Subnet ID list, for the ISUP NP with EPAP feature.

Keyword: dlt-subnetid

Related Commands: ent-subnetid, rtrv-subnetid

Command Class: Database Administration

Parameters

:subnetid= (mandatory)
 Subnet ID
Range: 1-15 digits

Example

```
dlt-subnetid:subnetid=886933
```

Dependencies

The value **none** cannot be specified for the **subnetid** parameter.

The specified Vendor ID entry must already exist in the SUBNETID table.

Notes

None.

Output

```
dlt-subnetid:subnetid=886933
rlghncxa03w 04-10-07 11:11:28 EST EAGLE 31.11.0
SUBNETID table is (6 of 50) 3% full
DLT-SUBNETID: MASP A - COMPLTD
;
```

dlt-t1

Delete T1 Interface

Use this command to delete an interface for E1/T1 MIM cards or HC-MIM or E5-E1T1 cards used as T1 or ST-HSL-A cards.

NOTE: On HC-MIM and E5-E1T1 cards, T1 ports 1, 3, 5, and 7 (master ports) can be independently channel bridged with their adjacent even numbered (slave) ports

2, 4, 6, and 8 to allow non-signaling data pass-through. The slave port interface is automatically deleted with the command that deletes its master port interface.

Keyword: dlt-t1

Related Commands: chg-t1, ent-t1, rtrv-e1, tst-t1

Command Class: Database Administration

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:t1port= (mandatory)

T1 card port number. The value must be a T1 port for which an interface has already been configured on the specified T1 card.

Range: 1-8

Ports 3-8 are valid only for HC-MIM and E5-E1T1 cards.

Example

```
dlt-t1:loc=1205:t1port=2
```

Dependencies

The specified card location (**loc** parameter) must be equipped.

The card in the specified card location (**loc** parameter) must be a **limt1** card type.

The port specified by the **t1port** parameter must be already equipped with an T1 interface.

All signaling links providing timeslots serviced by the specified T1 interface must be deleted before the T1 interface can be deleted. Use the **dlt-slk** command to delete the signaling links providing the timeslots.

A channel bridged slave (even-numbered) port on an HC-MIM or E5-E1T1 card cannot be specified in the **t1port** parameter. To delete channel bridged port interfaces, specify the master (odd-numbered) port in the **t1port** parameter. The slave port interface is automatically deleted when its master port interface is deleted.

Card locations 1113, 1114, 1115, 1116, 1117, 1118 (OAM, TDM, MDAL cards) cannot be specified as values for the **loc** parameter.

Notes

None.

Output

```
dlt-t1:loc=1205:t1port=1
rlghncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0
DLT-T1: MASP A - COMPLTD
;
```

dlt-tt

Delete Translation Type

Use this command to remove a translation type from the system database.

NOTE: When the EGTT feature is turned on, the GTT Selector (**ent/chg/dlt/rtrv-gttset**), GTT Set (**ent/dlt/rtrv-gttset**), and GTA (**ent/chg/dlt/rtrv-gta**) commands replace the Translation

Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is turned on.

Keyword: dlt-tt

Related Commands: ent-tt, rtrv-tt

Command Class: Database Administration

Parameters

:alias= (optional)

The global title translation type

Range: 000-255

Default: No translation type given

:ttn= (optional)

Translation type name.

Range: ayyyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

Default: No translation name is given

:type/typea/typeei/typen/typen24/typeis/typens= (optional)

Translation type. This parameter identifies the translation type and network type. This parameter is the decimal representation of the 1-byte field used in SS7.

The **type** and **typea** parameters specify an ANSI network.

The **typei** parameter specifies an ITU-international network.

The **typen** parameter specifies an ITU-national network.

The **typen24** parameter specifies a 24-bit ITU-national network.

The **typeis** parameter specifies an ITU-international spare network.

The **typens** parameter specifies an ITU-national spare network.

A translation type numeric value may be entered as ANSI type (**type** or **typea**) and as an ITU type (**typei/typen/typen24/typeis/typens**). However, they are separate entities.

The point code domain translation types for GTT are handled by the EAGLE 5 ISS protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I spare, ITU-N, ITU-N spare, and ITU-N24.

Range: 0-255

Default: No translation type is specified

Example

```
dlt-tt:type=230
```

```
dlt-tt:ttn=lidb
```

```
dlt-tt:type=230:ttn=lidb
```

```
dlt-tt:type=230:ttn=lidb:alias=030
```

```
dlt-tt:typeis=3
```

```
dlt-tt:typens=4
```

```
dlt-tt:typeis=1:ttn=setitu001
```

Dependencies

Asterisk (*) parameter values are not allowed in this command.

To delete a translation type, the translation type, the translation name, or both, must be specified.

If the translation type is specified, it must already exist in the database for the network type.

If the translation name is specified, it must already exist in the database.

If the translation type is specified, it cannot be an **alias** value.

If both the translation type and translation name are specified, they must correspond.

The translation type cannot be deleted if there are current GTT entries that reference it.

To delete an **alias**, both the **alias** and the translation type must be specified, and both must already exist in the database for the network type.

If an **alias** is specified, it must be associated with the specified translation type and cannot be the value of an existing translation type.

Either the **type** parameter or **ttn** parameter must be specified.

If aliases exist, they must be removed from the database before the translation types can be removed.

The GTT set associated with the translation type specified by the **ttn** parameter must have a set type of **cdgta** (see the **ent-gttset** command).

The network domain of the translation type specified by the **ttn** parameter cannot be CROSS (see the **ent-gttset** command).

The **ttn=none** parameter cannot be specified.

Notes

If the specified translation type entry is not referenced by a current global title translation entry and does not have any aliases, the translation type entry is removed.

The **dlt-tt** command can delete only selector entries that have been provisioned by GTT Selector commands, have a GTI value of 2, and a set type of CdGTA.

Output

```
dlt-tt:typens=4
tekelecstp 10-03-28 16:51:25 EST Eagle 42.0.0
DLT-TT: MASP A - COMPLTD
;
```

dlt-ttmap

Delete Translation Type Mapping

Use this command to delete from the database a mapped SS7 message translation type (TT) for a given gateway linkset name. For example, suppose you are mapping the translation type 001 (before TT mapping) to 238 (after TT mapping). You can use this command to delete that mapping from the database.

Keyword: **dlt-ttmap**

Related Commands: **chg-ttmap**, **ent-ttmap**, **rtrv-ttmap**

Command Class: Database Administration

Parameters

:lsn= (mandatory)

Linkset name. The unique network identifier for the gateway linkset.

Range: *ayyyyyyyy*

1 alphabetic character followed by 9 alphanumeric characters

:ett= (optional)

Translation type before mapping. The identification of the type of global title translation in the SS7 message *before* translation type mapping. This attribute is the decimal representation of the 1-octet binary field used by the SS7 protocol to identify the translation type.

Range: 0-255

:io= (optional)

Incoming or outgoing. The system uses this parameter to indicate whether the translation type mapping data provisioned for the gateway linkset is for SS7 messages *received* or *sent* on the linkset.

Range: i, o

i— incoming

o— outgoing

Default: Both incoming and outgoing

Example

```
dlt-ttmap:lsn=n c001:io=i:ett=128:mtt=55
```

Dependencies

None

Notes

None

Output

```
dlt-ttmap:lsn=nc001:io=i:ett=128:mtt=55
  rlgncxa03w 04-02-22 11:18:50 EST EAGLE 31.3.0
  TTMAP table for nc001 is (2 of 64) 3% full
  DLT-TTMAP: MASP A - COMPLTD
;
```

dlt-uim-acthresh

Delete Activity Level Threshold for STP UIM Activity Reporting

Use this command to clear the level of activity threshold that is used to report UIM messages.

Keyword: dlt-uim-acthresh

Related Commands: rtrv-uim-acthresh, set-uim-acthresh

Command Class: Database Administration

Parameters

:uimn= (mandatory)

The UIM number.

Range: 1000-1499

Example

Clears UIM number 1333 message threshold:

```
dlt-uim-acthresh:uimn=1333
```

Dependencies

The **uimn** parameter value must be a numeric value in the range of **1000–1499**.

The specified **uimn** value must exist in the UIM Threshold database table.

Notes

None

Output

```

dlt-uim-acthresh:uimn=1333

rlghncxa03w 04-02-01 08:50:12 EST EAGLE 31.3.0
DLT-UIM-ACTHRESH: MASP A - COMPLTD
;

```

dlt-user**Delete User**

Use this command to remove a user from the system database.

Keyword: **dlt-user**

Related Commands: **act-user, chg-pid, chg-user, dact-user, ent-user, login, logout, rept-stat-user, rtrv-secu-user, rtrv-user**

Command Class: Security Administration

Parameters

:uid= (mandatory)

User ID

Range: *azzzzzzzzzzzzzzzzz*

1 alphabetic character followed by up to 15 alphanumeric characters

Example

```
dlt-user:uid=terryjohnson
```

Dependencies**Notes**

If the user being removed is logged onto the system, this command logs the user off immediately.

Output

```

dlt-user:uid=terryjohnson

rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
DLT-USER: MASP A - COMPLTD
;

```

dlt-vendid**Delete Vendor ID**

Use this command to delete a Vendor ID entry from the Vendor ID list, for the GSM MAP SRI Redirect to Serving HLR feature.

Keyword: **dlt-vendid**

Related Commands: **ent-vendid, rtrv-vendid**

Command Class: Database Administration

Parameters

:vendid= (mandatory)

Vendor ID

Range: 1-15 digits

Example

```
dlt-vendid:vendid=886933
```

Dependencies

The value **none** cannot be specified for the **vendid** parameter.

The specified Vendor ID entry must already exist in the VendID table.

Notes

None.

Output

```
dlt-vendid:vendorid=886933
rlghncxa03w 04-10-07 11:11:28 EST EAGLE 31.11.0
VENDID table is (6 of 200) 3% full
DLT-VENDID: MASP A - COMPLTD
;
```

dlt-vflx-cd

Delete VFLEX Call Decision Entry

Use this command to delete call decision criteria from the Call Decision table.

NOTE: The V-Flex feature must be enabled before this command can be entered.

Keyword: dlt-vflx-cd

Related Commands: chg-vflx-cd, ent-vflx-cd, rtrv-vflx-cd

Command Class: Database Administration

Parameters

:cdn= (mandatory)

Call decision name. This parameter specifies the entry in the Call Decision table to be deleted.

Range: *ayyy*

1 alphabetic character followed by 3 alphanumeric characters

Example

```
dlt-vflx-cd:cdn=cdn1
```

Dependencies

The value specified for the **cdn** parameter cannot be a reserved word, such as **none**.

The value specified for the **cdn** parameter must already exist in the Call Decision table.

The V-Flex feature must be enabled before this command can be entered.

Output

```
dlt-vflx-cd:cdn=cdn1
rlghncxa03w 08-05-07 11:11:28 EST EAGLE 39.0.0
DLT-VFLX-CD: MASP A - COMPLTD
;
```

dlt-vflx-rn

Delete VFLEX Routing Number

Use this command to delete a voice mail routing number from the Routing Number table.

NOTE: The V-Flex feature must be enabled before this command can be entered.

Keyword: dlt-vflx-rn

Related Commands: chg-vflx-rn, ent-vflx-rn, rtrv-vflx-rn

Command Class: Database Administration

Parameters

:rnname= (mandatory)

Routing number name. This parameter specifies the voice mail routing number to be deleted.

Range: *ayyyyyyy*
1 alphabetic character followed by 7 alphanumeric characters.

Example

```
dlt-vflx-rn:rname=rn01
```

Dependencies

The V-Flex feature must be enabled before this command can be entered.

The value specified for the **rname** parameter must already exist in the Routing Number table.

The value specified for the **rname** parameter cannot be referenced by an entry in the VMSID table.

The value specified for the **rname** parameter cannot be a reserved word such as **none**.

Output

```
dlt-vflx-rn:rname=rn02
rlghncxa03w 08-05-29 08:51:12 EST EAGLE 39.0.0
DLT-VFLX-RN: MASP A - COMPLTD
;
```

dlt-vflx-vmsid**Delete VFLEX VMSID Entry**

Use this command to delete a voice mail server ID from the VMSID table.

NOTE: The V-Flex feature must be enabled before this command can be entered.

Keyword: **dlt-vflx-vmsid**

Related Commands: **chg-vflx-vmsid**, **ent-vflx-vmsid**, **rtrv-vflx-vmsid**

Command Class: Database Administration

Parameters

:id= (mandatory)

This parameter specifies the voice mail server to be deleted.

Range: 1-15 digits, **dflt**

Valid digits are **0-9**, **A-F**, **a-f**

dflt—the default VMS ID

Example

```
dlt-vflx-vmsid:id=1234ae4
```

Dependencies

The V-Flex feature must be enabled before this command can be entered.

The value specified for the **vmsid** parameter must already exist in the VMSID table.

Output

```
dlt-vflx-vmsid:id=1234ae5
rlghncxa03w 08-05-29 08:51:12 EST EAGLE 39.0.0
DLT-VFLX-VMSID: MASP A - COMPLTD
;
```

enable-ctrl-feat**Enable Controlled Feature**

Use this command to enable a controlled feature that the customer has purchased.

NOTE: The “LNP (Local Number Portability) feature” is turned on when the LNP ported TNs quantity is greater than 0 in the `rtrv-ctrl-feat` command output. An LNP ported TNs quantity feature access key has been enabled and turned on.

Keyword: `enable-ctrl-feat`

Related Commands: `chg-ctrl-feat`, `rtrv-ctrl-feat`

Command Class: Database Administration

Parameters

:fak= (mandatory)

Feature Access Key. This parameter specifies the Feature Access Key for the feature.

Range: `ayyyyyyyyyyy`

13 alphanumeric characters; the first character must be a letter.

The feature access key cannot contain any special characters, including spaces and dashes. Upper-case characters are mapped to lower case.

:partnum= (mandatory)

Part number. This parameter specifies the part number for the feature.

Range: `893000000 - 893999999`

Do not include dashes in the 9-digit number.

Example

```
enable-ctrl-feat:partnum=893xxxxxx:fak=xxxxxxxxxxxxxx
```

Dependencies

CAUTION: Never install or initialize MCAP cards in card slots 1113 and 1115 after GPSM-II cards are provisioned in these slots. Attempting to initialize MCAP cards after GPSM-II cards have been provisioned in slots 1113 and 1115 will cause a system outage. Before replacing an existing GPSM-II card in slot 1113 or slot 1115, contact the Customer Care Center.

The phrase "Service Module cards" refers to DSM, E5-SM4G, or E5-SM8G-B cards when any of these cards can be used. If a specific card is required, then the appropriate requirement is listed.

The system serial number must be locked in the database before this command can be entered for the feature (see the `ent-serial-num` command).

The feature access key must be valid for the specified feature part number and for the system serial number.

A feature cannot be enabled with this command when the feature has already been enabled with a temporary feature access key, a permanently On feature access key, or a feature access key for a quantity that is greater than the quantity specified in the command.

A temporary feature access key can be used only one time to enable a feature. After the temporary feature access key expires, you must purchase the feature before you can use a permanent feature access key to enable the feature.

A temporary feature access key cannot be used to enable features that do not allow a temporary feature access key. The following features allow a temporary feature access key:

- 15 Minute Measurements
- Command Class Management
- EAGLE OA&M IP Security
- IDP Screening for Prepaid
- Intermediate GTT Load Sharing (IGTTLS)

- LNP ELAP Configuration
- LNP Short Message Service (LNP SMS)
- MNP Circular Route Prevention
- Network Security Enhancements
- Portability Check for MO SMS
- Prepaid IDP Query Relay
- SCCP Conversion
- Telnet

The GTT feature must be on before the IDP Screening for Prepaid feature can be enabled.

The value specified for the **partnum** parameter must be the correct part number for the purchased feature.

A valid system serial number must be entered in the database before this command can be entered for the feature (see the **ent-serial-num** command).

The LNP ELAP Configuration feature and the WNP feature must be turned on before the LNP SMS feature can be enabled.

The GTT feature must be turned on before the XGTT Table Expansion feature can be enabled.

The DSTN5000 feature bit for the 5000 Routesets feature must be turned on before the 6000 Routesets, 7000 Routesets, 8000 Routesets, or 10,000 Routesets feature can be enabled.

The 7000 Routesets or 8000 Routesets feature cannot be enabled if more than 8000 alias point codes are already assigned in the system. The 10,000 Routesets feature cannot be enabled if more than 10000 alias point codes are already assigned in the system.

If the LNP (an LNP ported TNs quantity), LNP 150,000 LRNs, or LNP 300,000 NPANXX feature is enabled, then none of the following features can be enabled:

- AINPQ
- A-Port
- ATINP
- Equipment Identity Register (EIR)
- G-Flex
- G-Port
- Info Analyzed Relay Base (IAR Base)
- INP
- IS41 GSM Migration (IGM)
- MO SMS ASD
- MO SMS GRN
- MO-based GSM SMS NP
- MO-based IS41 SMS NP
- MTP Msgs for SCCP Apps
- Portability Check for MO SMS

- Prepaid IDP Query Relay (IDP Relay)
- Prepaid SMS Intercept Phase 1 (PPSMS)
- TIF Number Portability
- TIF Number Substitution
- TIF Subscriber CgPN Blacklist
- V-Flex

The LNP feature (an LNP ported TNs quantity) must be enabled before the LNP 150,000 LRNs feature or the LNP 300,000 NPANXXs feature can be enabled.

The LNP ELAP Configuration feature must be enabled, and turned on with the **chg-ctrl-feat** command, before the features for the following quantities can be enabled:

- The LNP feature for a quantity equal to or greater than 24 million TNs
- The 150,000 LNP LRNs feature
- The 300,000 NPANXXs feature

The LNP feature for 24 million TNs requires all DSM cards with a minimum of 2GB of memory.

The LNP feature for 36 million TNs requires all DSM cards with a minimum of 3GB of memory.

The LNP feature for LNP ported TNs quantities of 48 million TNs to 192 million TNs requires all Service Module cards with a minimum of 4GB of memory. The LNP feature for LNP ported TNs quantities of 204 million TNs to 228 million TNs requires all DSM cards with a minimum of 4GB of memory.

The 150,000 LNP LRNs feature requires all Service Module cards; any DSM cards must have a minimum of 2GB of memory.

The 300,000 LNP NPANXXs feature requires all Service Module cards; any DSM cards must have a minimum of 2GB of memory.

The GTT feature bit must be turned on (see the **chg-feat** command) before the following features can be enabled:

- Advanced GT Modification (AMGTT)
- ANSI41 AIQ
- ATI Number Portability Query (ATINP)
- E5-SM4G Throughput Capacity
- Equipment Identity Register (EIR)
- G-Flex
- GSM Map Screening (GSM)
- Hex Digit Support for GTT
- Info Analyzed Relay Base (IAR Base)
- Intermediate GTT Loadsharing (IGTTLS)
- LNP ELAP Configuration
- LNP ported LRNs
- LNP ported NPANXXs

- LNP ported TNs
- MO SMS ASD
- MO SMS GRN
- MO SMS IS41-to-GSM Migration
- MO-based GSM SMS NP
- MO-based IS41 SMS NP
- MTP Msgs for SCCP Apps
- MTP Routed Gateway Screening Stop Action
- Portability Check for MO SMS (MNPSMS)
- Prepaid SMS Intercept Ph1 (PPSMS)
- SCCP Loop Detection
- TIF Additional Subscriber Data
- TIF Generic Routing Number
- TIF Number Portability
- TIF Number Substitution
- TIF Range CgPN Blacklist
- TIF SCS Forwarding
- TIF Simple Number Substitution
- TIF Subscriber CgPN Blacklist
- Transaction-based GTT Loadsharing (TBGTTLs)
- Voice Mail Router (V-Flex)

If the SCCP Conversion or TCAP Conversion feature is turned on, then the ANSI/ITU SCCP Conversion feature cannot be enabled.

The ANSI/ITU SCCP Conversion feature requires Service Module cards in the system.

The GSM Map Screening (GSM) feature must be turned on before the Enhanced GSM Map Screening (EGSM) feature can be enabled.

The Enhanced GSM Map Screening (EGSM) feature must be turned on before the MTP MAP Screening feature can be enabled.

The Measurements Platform feature must be turned on and the Measurements Platform collection function must be enabled (see the **chg-measopts:platformenable=on** parameter) before the MTP MAP Screening feature can be enabled (at least one MCPM card must be active).

The G-Port feature must be turned on before the following features can be enabled:

- GSM MAP SRI Redirect for Serving HLR
- ISUP NP with EPAP
- MNP Circular Route Prevention
- Prepaid SMS Intercept Phase 1 (PPSMS)

The GWS (Gateway Screening) feature must be turned on before the following features can be enabled:

- Integrated GLS
- ISUP NP with EPAP
- TIF Additional Subscriber Data
- TIF Generic Routing Number
- TIF Number Portability
- TIF Number Substitution
- TIF Range CgPN Blacklist
- TIF SCS Forwarding
- TIF Simple Number Substitution
- TIF Subscriber CgPN Blacklist

The following features cannot be enabled if the **ansigflex** system option is enabled (see the **chg-stpopts** command):

- 1100 TPS/DSM for ITU NP
- ANSI-41 INP Query (AINPQ)
- A-Port
- ATINP
- Equipment Identity Register (EIR)
- G-Flex MAP Layer Routing
- G-Port
- Info Analyzed Relay Base
- INP
- IS41 GSM Migration (IGM)
- MO SMS ASD
- MO SMS GRN
- MO SMS IS41-to-GSM Migration
- MO-based SMS GSM NP
- MO-based SMS IS41 NP
- Portability Check for MO SMS
- TIF Number Portability
- TIF Number Substitution
- TIF Subscriber CgPN Blacklist
- V-Flex

Before an LNP ported TNs quantity greater than 96 million numbers can be enabled, an ELAP system that supports a quantity greater than 96 million numbers must be available to the EAGLE 5 ISS.

- The ELAP software must be at version 4.0 to support LNP ported TNs quantities greater than 96 million numbers and up to 120 million numbers.

- The ELAP software must be at version 5.0 or greater to support LNP ported TNs quantities greater than 120 million numbers. A quantity greater than 120 million numbers cannot be enabled until the ELAP is upgraded to the required software level, and the appropriate ELAP commands are issued to convert the 120 Million LNP Numbers database structure to the data compaction structure for more than 120 million numbers.

The **rept-stat-mps** command can be entered at the EAGLE 5 ISS to determine the ELAP software version.

Service Module cards running the VSCCP application must be present in the system before the following features can be enabled:

- AINPQ
- ANSI41 AIQ
- A-Port
- ATI Number Portability Query (ATINP)
- EIR
- Enhanced GSM MAP Screening (EGMS)
- Flexible GTT Load Sharing
- G-Flex
- G-Port
- INP
- IS41 GSM Migration (IGM)
- LNP ELAP Configuration
- MO SMS ASD
- MO SMS B-Party Routing
- MO SMS GRN
- MO SMS IS41-to-GSM Migration
- MO-based GSM SMS NP
- MO-based IS41 SMS NP
- Origin-based SCCP Routing (OBSR)
- PPSMS
- SCCP Loop Detection
- SCCP Loop Detection
- TIF Additional Subscriber Data
- TIF Generic Routing Number
- TIF Number Portability
- TIF Number Substitution
- TIF Range CgPN Blacklist
- TIF SCS Forwarding
- TIF Simple Number Substitution

- TIF Subscriber CgPN Blacklist
- Transaction-based GTT Loadsharing (TBGTTLS)
- Weighted GTT Loadsharing (WGTTLTSL)
- V-Flex

Before LNP ported TNs quantities greater than 96 million numbers can be enabled, an ELAP system must be available to validate its software version to the EAGLE 5 ISS.

The Enhanced GTT (EGTT) feature must be turned on before the following features can be enabled

- Flexible Linkset Optional Based Routing (FLOBR)
- GTT Action - DISCARD
- GTT Action - DUPLICATE
- GTT Action - FORWARD
- MO SMS B-Party Routing
- Origin-based SCCP Routing

At least one of the EPAP-based ITU NP features (G-Port, A-Port, INP, IGM, EIR, IDP Relay, ANSI-41 INP Query, V-Flex, or PPSMS) must be turned on before the 1100 TPS/DSM for ITU NP feature can be enabled.

The GTT feature must be turned on (see the **chg-feat** command) before the A-Port feature can be enabled.

The GTT feature must be turned on (see the **chg-feat** command) before the G-Port feature can be enabled.

The GTT feature must be turned on (see the **chg-feat** command) before the IS41 GSM Migration (IGM) feature can be enabled.

If a DSM card with less than 4 gigabytes of memory is present in the system, the following features cannot be enabled

- A-Port
- MO SMS ASD
- MO SMS B-Party Routing
- MO SMS GRN
- MO SMS IS41-to-GSM Migration
- MO SMS Prepaid Intercept on B-Party
- Portability Check for MO SMS
- PPSMS

The PPSMS feature cannot be enabled if the LNP ELAP Configuration feature is turned on.

Service Module cards must be provisioned in the system before the Prepaid IDP Query Relay feature can be enabled.

The GTT feature must be turned on before the Prepaid IDP Query Relay feature can be enabled.

E5-SM4G and E5-SM8G-B cards do not support LNP ported TNs quantities of 204-228 million numbers. DSM cards are required.

The IP User Interface feature must be enabled before the SEAS Over IP feature can be enabled.

If the TIF (Number Portability/ Additional Subscriber Data / Generic Routing Number) is enabled, then the LNP feature cannot be enabled. If the LNP feature is enabled, then the TIF (Number Portability/ Additional Subscriber Data / Generic Routing Number) feature cannot be enabled.

The Multiple Point Code (MPC) feature must be turned on before the Multiple Linksets to Single Adjacent PC (MLS) feature can be enabled.

The G-Flex feature must be turned on before the G-Flex MAP Layer Routing feature can be enabled.

The G-Port feature must be enabled before the following features can be enabled:

- G-Port SRI Query for Prepaid
- MT-Based GSM SMS NP

The A-Port feature must be enabled before the MT-Based IS41 SMS NP feature can be enabled.

The AMGTT CdPA Only feature cannot be enabled using the **enable-ctrl-feat** command. This feature is automatically enabled and turned on if the MGTT feature was on before upgrade to EAGLE 5 ISS Release 38.0 occurred.

The AMGTT CdPA Only feature must be turned on before the AMGTT CgPA Upgrade feature can be enabled.

If the AMGTT CdPA Only feature or the AMGTT CgPA Upgrade feature is turned on, then the AMGTT feature cannot be enabled.

The LNP (an LNP ported TNs quantity), LNP 150,000 LRNs, or LNP 300,000 NPANXX feature cannot be enabled if the INP or AINPQ feature is turned on or if any of the features listed below is enabled. If the LNP (an LNP ported TNs quantity), LNP 150,000 LRNs, or LNP 300,000 NPANXX feature is enabled, then none of the features listed below can be enabled.

- A-Port
- ATINP
- Equipment Identity Register (EIR)
- G-Flex
- G-Port
- Info Analyzed Relay Base (IAR Base)
- IDP Screening for Prepaid
- IS41 GSM Migration (IGM)
- MO SMS ASD
- MO SMS GRN
- MO SMS IS41-to-GSM Migration
- MO-based GSM SMS NP
- MO-based IS41 SMS NP
- MTP Msgs for SCCP Apps
- Portability Check for MO SMS (MNPSMS)
- Prepaid IDP Query Relay (IDP Relay)
- Prepaid SMS Intercept Phase 1 (PPSMS)

- TIF Number Portability
- TIF Number Substitution
- TIF Subscriber CgPN Blacklist
- V-Flex

The MT-Based GSM SMS NP feature must be enabled before the MT-Based GSM MMS NP feature can be enabled.

The LNP ported TNs 24 Million Quantity feature or greater must be turned on before the LRNQT feature can be enabled.

The Intermediate GTT Load Sharing feature must be turned on before the GTT LS ARI feature can be enabled.

The Flexible GTT Load Sharing feature must be enabled before the GTT LS ARI feature can be enabled.

The Flexible Linkset Optional Based Routing (FLOBR) feature must be turned on before the TCAP Opcode Based Routing (TOBR) feature can be enabled.

The Variable Length GTT (VGTT) feature must be turned on before the Support for 16 GTT Lengths in VGTT feature can be enabled.

The TOBR feature must be turned on before any of the TOBR Quantity features can be enabled.

A TOBR quantity feature cannot be enabled if a TOBR feature with a higher quantity is enabled.

If the TOBR quantity feature of maximum quantity level is enabled, then no other TOBR Quantity feature can be enabled.

The Prepaid IDP Query Relay feature must be turned on before the following features can be enabled:

- IDP A-Party Blacklist
- IDP A-Party Routing
- IDP Service Key Routing

The INP feature must be turned on before the INP CRP feature can be enabled.

The Default Country Code must be provisioned (see the **defcc** parameter in the **chg-stpopts** command) before the ATINP, IAR Base, MT-Based GSM SMS NP, or MT-Based IS41 SMS NP feature can be enabled.

If the system contains any cards other than those listed below, then the 2800 links quantity of the Large System # Links feature cannot be enabled:

- E5-ATM
- E5-ATM-B
- E5-E1T1
- E5-ENET
- E5-ENET-B
- E5-IPSM
- E5-OAM
- E5-SM4G
- E5-SM8G-B

- E5-TSM (GLS)
- HC-MIM
- HIPR
- HIPR2
- IPSM
- MCPM
- SSEDCM
- TSM (GLS)

The Info Analyzed Relay Base (IAR Base) feature must be enabled before the IAR NP, IAR GRN, or IAR ASD feature can be enabled.

The S-Port feature and the IDP A-Party Blacklist feature cannot both be enabled in the system.

The value specified for the **partnum** parameter must consist of 9 digits, without any dashes. The first three digits are **893**. The next six values are numeric (**0...9**).

The Service Portability (S-Port) feature must be enabled before the S-Port Subscriber Differentiation feature can be enabled.

If the system is not in mixed mode and is equipped with GPSM-II/TDM card(s), then the Integrated GLS and Integrated Measurements features cannot be enabled.

The A-Port or IGM feature must be turned on before the LOCREQ Query Response feature can be enabled.

If a PCT feature of maximum quantity level is enabled, then a PCT feature of a lower quantity cannot be enabled.

A PCT feature cannot be enabled if the quantity is higher than the quantity of the associated FAK.

If a DSM card is provisioned in the system, then the FLOBR, GTT Action – DUPLICATE, and VGTT-16 features cannot be enabled.

If an EOAM card is in the active or standby MASP location, then the 10,000 Routesets feature cannot be enabled.

The VCI value for any ATM link (see the **ent-slk** command) must be less than or equal to 16383 before a 3 Links per E5-ATM Card feature quantity can be enabled.

The **mtplprst** option must be configured (see the **chg-stpopts** command) before the Origin-based MTP Routing feature can be enabled.

The **matchseq=dn** parameter must be specified (see the **chg-tifopts** command) before the TIF Number Substitution feature can be enabled.

Each provisioned Service Module card must have at least 4G memory before the AINPQ feature can be enabled.

Notes

XGTT or XMAP (GTT or MAP Table Increase) Feature

After the XGTT feature is enabled, the feature cannot be disabled or turned off.

After the XMAP feature is enabled, the feature cannot be disabled or turned off.

1500 Links and 2000 Links Support

After the 1500 Links feature or the 2000 Links Support feature is enabled, the feature cannot be disabled or turned off.

SE-HSL SLK Capacity

The SE-HSL feature allows unchannelized E1 links to be provisioned. The maximum numbers of unchannelized signaling links that can be assigned to HC-MIM and E5-E1T1 cards in the system when each SE-HSL SLK Capacity quantity feature access key are:

- 893-0130-01—4
- 893-0130-02—8
- 893-0130-03—16
- 893-0130-04—24
- 893-0130-05—32
- 893-0130-06—40
- 893-0130-07—48
- 893-0130-08—56
- 893-0130-09—64
- 893-0130-10—72
- 893-0130-11—80

LNP 384 Million TNs, LNP 300,000 NPANXXs, LNP 150,000 LRNs, and LNP ELAP Configuration Features

Table 5-20 lists the types and memory capacity for the Service Module cards required by each LNP quantity feature. Quantities of 204-228 million TNs require DSM cards and do not support E5-SM4G or E5-SM8G-B cards. Quantities of 240-384 million TNs require E5-SM4G or E5-SM8G-B cards.

Table 5-20. Minimum Hardware Required for LNP Quantity Features

Object / Capacity	Minimum Hardware	Part Number
24 Million TNs	2 GB DSM	893-0110-06
36 Million TNs	3 GB DSM	893-0110-07
48 Million TNs	4 GB Service Module card	893-0110-08
60 Million TNs	4 GB Service Module card	893-0110-09
72 Million TNs	4 GB Service Module card	893-0110-10
84 Million TNs	4 GB Service Module card	893-0110-11
96 Million TNs	4 GB Service Module card	893-0110-12
108 Million TNs	4 GB Service Module card	893-0110-13
120 Million TNs	4 GB Service Module card	893-0110-14
132 Million TNs	4 GB Service Module card	893-0110-15

Flexible GTT Load Sharing

The Flexible GTT Load Sharing feature allows a PC or PC/SSN combination to be provisioned in multiple load-sharing relationships for post-GTT load sharing of intermediate and final GTT traffic.

Load sharing for intermediate GTT traffic requires the Intermediate GTT Load Sharing feature, which can be run in conjunction with the Flexible GTT Load Sharing feature. Intermediate GTT load sharing is performed through the MRN table, and the GTT destination is a PC. If both the Intermediate and Flexible GTT Load Sharing features are on, different load-sharing relationships can be defined between the same set of PCs, and different sets of destinations can contain the same PCs.

Load sharing for final GTT traffic is performed through the MAP table, and the GTT destination is a PC/SSN combination. If the Flexible GTT Load Sharing feature is on, different load-sharing relationships can be defined between the same set of PC/SSNs, and different sets of destinations can contain the same PC/SSN combinations.

Weighted GTT Loadsharing

The Weighted GTT Loadsharing feature allows a PC or PC/SSN combination to be provisioned with weights and threshold values to change the loadsharing method. This weight is relative to the weights of the PCs or PC/SSNs that have the same relative cost (RC group) and determines the relative percentage of traffic sent to the PC or PC/SSN. If the total available weight of the PCs or PC/SSNs in the RC group falls below the threshold, that RC group is not used and the next lowest RC group is used for traffic loadsharing.

SEAS Over IP

All database commands associated with the SEAS Over IP feature can be entered after the SEAS Over IP feature is enabled.

SCCP Loop Detection

The SCCP Loop Detection feature allows sets of point codes that form a routing loop in the network to be specified. These sets are linked with GTT sets and are checked during intermediate and final GTT traffic routing. If a loop exists, either the system can simply be notified or the traffic can be discarded. The SCCP Loop Detection feature requires the GTT feature and is supported on Service Module cards.

Multiple Linksets to a Single Adjacent PC (MLS)

The MLS feature allows multiple linksets to be established to a single adjacent destination point code.

Voice Mail Router (V-Flex)

The V-Flex feature allows calls to be routed to a specific voice mail server based on subscriber and call context data.

Proxy Point Code Capacity

The Proxy Point Code feature allows the EAGLE 5 ISS to assume the point codes of other nodes. The total numbers of proxy point codes that can be provisioned in the system for each quantity are:

- 893-0187-01—10
- 893-0187-02—20
- 893-0187-03—30
- 893-0187-04—40
- 893-0187-05—50
- 893-0187-06—60
- 893-0187-07—70
- 893-0187-08—80
- 893-0187-09—90
- 893-0187-10—100

E5-SM4G Throughput Capacity

The E5-SM4G Throughput Capacity feature is a quantity feature that is used to increase the SCCP traffic processing capacity of an E5-SM4G or E5-SM8G-B card.

- 893-0191-01—5000 TPS
- 893-0191-02—6800 TPS

· 893-0191-03—10000 TPS

NOTE: The 893-0191-03 Part Number applies to E5-SM8G-B cards only.

Table 5-21 displays the TPS capacities for each E5-SM4G Throughput Capacity Quantity

NOTE:

Table 5-21. TPS Capacities

Feature Quantity Part Number	Maximum TPS Capacity per Card	Maximum System TPS Capacity*
893-0191-01	3125 (if one or more EPAP-based features are enabled)	75,000 TPS with one or more EPAP-based features and 24+1 cards 96,875 TPS with one or more EPAP-based features is and 31+1 cards
	5000 (if no EPAP-based features are enabled).	155,000 TPS (if one or more GTT-based features is turned on) and 31+1 cards 40,000 TPS (if one or more ELAP-based features is enabled) with 8+1 cards 85,000 TPS (if one or more ELAP-based features is enabled) with 17+1 cards
893-0191-02	6800	210,800 TPS with or without EPAP-based features and 31+1 cards 163,200 TPS with one or more EPAP-based features and 24+1 cards 54,400 TPS with ELAP and 8+1 cards 115,600 TPS with ELAP and 17+1 cards
893-0191-03	10000	310,000 TPS with or without EPAP-based features and 31+1 cards 240,000 TPS with one or more EPAP-related features and 24+1 cards 80,000 TPS with ELAP and 8+1 cards 170,000 TPS with ELAP and 17+1 cards

HIPR2

The HIPR2 High Rate Mode feature (Part Number 893-0201-01) must be enabled before a system equipped with all HIPR2 cards can use the entire channel for data and provide a throughput rate of 2.5Gbps. If this feature is not enabled, then a system equipped with all HIPR2 cards provides an effective inter-shelf throughput rate of 1Gbps.

Advanced GT Modification (AMGTT)

There are three AMGTT features:

- Part number 893-0218-01: Advanced Global Title Modification (AMGTT). Allows non-MGTT customers to enable CdPA and CgPA functions after upgrade.
- Part number 893-0218-02: Advanced Global Title Modification, Called Party Only (AMGTT CdPA Only). Allows existing MGTT customers to continue using CdPA modification functions after upgrade. Does not allow any CgPA modification capabilities. The AMGTT CdPA Only feature cannot be enabled by this command. It is automatically enabled upon upgrading from the source release to EAGLE 5 ISS release 38.0 if the MGTT feature was turned on prior to the upgrade.
- Part number 893-0218-03: Advanced Global Title Modification, Calling Party Upgrade (AMGTT CgPA Upgrade). Allows existing MGTT customers to upgrade to AMGTT after upgrade to EAGLE 5 ISS release 38.0. Requires the AMGTT CdPA Only feature to be enabled, and allows full AMGTT CdPA and CgPA modification.

Prepaid IDP Query Relay

The IDPRCDPN(X) NPP Service must be turned on before the Prepaid IDP Query Relay feature can be turned on. The IDPRCGPN NPP service must be turned on to process Calling Party Numbers. The IDPRCGPN Service is reached from the IDPRCDPN Service.

The following warning message appears while enabling the Prepaid IDP Query Relay feature:

CAUTION

CAUTION: Any of IDPRCDPN(X) NPP services must be ON for turning ON IDPR feature.

MO SMS IS41-to-GSM Migration

The MO SMS IS41-to-GSM Migration feature addresses modifications to the MO-based IS41 SMS NP feature (893-0194-01) required to meet certain IS41-to-GSM Migration call flows. This feature also allows the IS412GSM Migration Prefix to be used as a prefix instead of the RTDB RN/SP when an SMS is destined for a GSM-migrated subscriber.

SLS Bit Rotation by Incoming Linkset (ISLSBR)

The ISLSBR feature allows SLS Bit rotation to occur on an incoming linkset. This feature provides the ability to configure distribution in an ANSI or ITU network.

Eagle Additional Subscriber Data

Prepaid IDP Query Relay and TIF framework features support ASD data, which can be associated with individual subscribers and ranges. IDPR and TIF ASD/GRN features address the addition of ASD fields into the EAGLE 5 ISS. The ASD feature allows generic data to be associated with DN and DN Block subscriber records.

Prepaid SMS Intercept Ph1

The MOSMSGCDPN and MOSMSGCGPN services must be provisioned before the MO SMS Prepaid Check feature is turned on for "Prepaid SMS Intercept Ph1" to be functional. The following warning message appears while enabling the MO SMS Prepaid Check feature:

CAUTION

CAUTION: MOSMSGCDPN or/and MOSMSGCGPN NPP Services must be turned on for the feature to be functional.

MO-based IS41 SMS NP and MO SMS IS41-to-GSM Migration

The MOSMSICDPN NPP service must be provisioned before the MO-based IS41 SMS NP or the MO SMS IS41-to-GSM Migration feature is turned on for the feature to be functional. The following warning message appears while enabling these features:

CAUTION: MOSMSICDPN NPP Services must be turned on for the feature to be functional.

Portability Check for MO SMS

The MOSMSGCGPN NPP service must be enabled before the Portability Check for MO SMS feature is turned on for the feature to be functional. The following warning message appears while enabling the feature:

CAUTION: MOSMSGCGPN NPP Services must be turned on for the feature to be functional.

MO-based GSM SMS NP

The MOSMSGCDPN NPP service must be provisioned before the MO-based GSM SMS NP feature is turned on for the feature to be functional. The following warning message appears while enabling the feature:

CAUTION: MOSMSGCDPN NPP Services must be turned on for the feature to be functional.

GTT Load Sharing With Alternate Routing Indicator

The GTT Load Sharing with Alternate Routing Indicator (GTT LS ARI) feature allows loadsharing relationships to be established between the MAP and MRN table in that the MAP and MRN sets allow provisioning of MRN and MAP sets, respectively, as the Alternate Mate RI if the point codes in the MAP or MRN table are unavailable.

ST-HSL-A SLK Capacity

The ST-HSL-A feature allows unchannelized T1 links to be provisioned. The total numbers of unchannelized signaling links that can be assigned to HC-MIM and E5-E1T1 cards in the system when each ST-HSL-A SLK Capacity quantity feature access key is enabled are:

- 893-0273-01—4
- 893-0273-02—8
- 893-0273-03—16
- 893-0273-04—24
- 893-0273-05—32
- 893-0273-06—40
- 893-0273-07—48
- 893-0273-08—56
- 893-0273-09—64
- 893-0273-10—72
- 893-0273-11—80
- 893-0273-12—88
- 893-0273-13—96

- 893-0273-14—104
- 893-0273-15—112
- 893-0273-16—120
- 893-0273-07—128
- 893-0273-18—136
- 893-0273-19—144
- 893-0273-20—152
- 893-0273-21—160
- 893-0273-22—168
- 893-0273-23—176
- 893-0273-24—180

MO SMS ASD, MO SMS GRN

The MOSMSGCGPN, MOSMSGCDPN, MOSMSICGPN, or MOSMSICDPN NPP service must be provisioned before the MO SMS ASD or MO SMS GRN feature is turned on for the feature to be functional. The following warning message appears while enabling the feature:

CAUTION: MOSMSGCDPN, MOSMSICDPN, MOSMSGCGPN or/and MOSMSICGPN NPP Services must be turned on for the feature to be functional.

CAUTION

Large MSU Support for IP Signaling

The Large MSU Support for IP Signaling feature supports MSUs having a Service Information Field (SIF) up to 4095 bytes over M2PA and M3UA Protocols with Service Indicator (SI) values ranging from 6 to 15. The values for the Service Indicators are:

- 6, 7—Data
- 9—Broadband ISDN
- 10—Satellite ISDN
- 13—BICC
- 14—H.248
- 8, 11, 12, 15—Spare

EPAP based features

If Global Title Translation (GTT) is on and more than 25 SCCP cards are provisioned, then when the first EPAP based feature is enabled, a warning is issued to state that the EAGLE 5 ISS must be connected to an EPAP T1200 or higher. Subsequent commands for enabling EPAP based features are accepted without any warning.

XUDT UDT Conversion feature

The XUDT UDT Conversion feature allows the following SCCP message conversions:

- UDT(S) messages to XUDT(S) messages
- Non-segmented XUDT(S) messages to UDT(S) messages
- Segmented XUDT(S) messages to UDT(S) messages

3 Links per E5-ATM Card feature

The 3 Links per E5-ATM Card feature is a quantity feature that supports a third link (A1) on an E5-ATM or E5-ATM-B card. Each quantity FAK supports the 3 Links per E5-ATM card feature in an increment of 5 cards, up to a maximum of 385 cards. Part numbers range from 893-0391-01 (supports the feature on 5 cards) to 893-0391-77 (supports the feature on 385 cards).

Point Code and CIC Translation (PCT)

The PCT feature is a quantity feature that allows the EAGLE 5 ISS to change the destination point code (DPC) and originating point code (OPC) of an MTP-routed MSU to previously configured values. The quantity is used to define the maximum number of allowed translations:

- 893-0372-01—25 translations
- 893-0372-02—50 translations
- 893-0372-03—75 translations
- 893-0372-04—100 translations
- 893-0372-05—150 translations
- 893-0372-06—200 translations
- 893-0372-07—250 translations
- 893-0372-08—1000 translations

Integrated GLS

The E5-OAM Integrated GLS (Integrated GLS) feature allows the E5-MASP cards to support the function of GLS cards for Gateway Screening. If the Integrated GLS feature is turned ON, the E5-MASP accepts the bind request for GWS screen set from network cards, binds the requested screen set, and downloads it to the requesting network card.

If the Integrated GLS feature is not turned ON, then the E5-MASP cards do not service the requests for binding screen sets and the network cards continue to send binding requests to the active GLS cards.

E5-ENET-B IPSG High Throughput

The E5-ENET-B IPSG High Throughput feature allows the E5-ENET-B card running the IPSG application to have a maximum capacity of 9500 TPS. If the feature is not turned on, then the E5-ENET-B card running the IPSG application has a maximum capacity of 6500 TPS.

Output

```
enable-ctrl-feat:partnum=893xxxxxx:fak=xxxxxxxxxxxxxxxx
tekelecstp 08-12-04 13:55:19 EST EAGLE 40.1.0
enable-ctrl-feat:partnum=893xxxxxx:fak=xxxxxxxxxxxxxxxx
Command entered at terminal #4.
ENABLE-CTRL-FEAT: MASP A - COMPLTD
;
```

The following example displays the output when more than 25 SCCP cards are provisioned and first EPAP-based feature is enabled.

This warning is issued when the first and only the first EPAP based feature is enabled.

```
enable-ctrl-feat:partnum=89xxxxxx:fak=xxxxxxxxxxxxxxxx
tekelecstp 10-02-26 15:40:56 EST EAGLE 42.0.0
enable-ctrl-feat:partnum=893xxxxxx:fak=xxxxxxxxxxxxxxxx
Command entered at terminal #4.

Warning: The Eagle must be connected to an EPAP T1200 or higher
ENABLE-CTRL-FEAT: MASP A - COMPLTD
;
```

ent-acg-mic**Enter ACG Manually Initiated Control**

Use this command to assign Automatic Call Gapping (ACG) controls to certain queries. The control can apply to all queries or to specific query services and called party digits. If the EAGLE 5 ISS LNP query service receives a query to which a control applies, then the EAGLE 5 ISS sends an ACG component, encoded as configured, with the response.

Keyword: ent-acg-mic

Related Commands: chg-acg-mic, dlt-acg-mic, rept-stat-lnp, rtrv-acg-mic

Command Class: Database Administration

Parameters

:drtn= (mandatory)

Duration index. The amount of time that the ACG is in effect. This number is mapped to a time value at the LNP node.

Range: 1-13

Default: The current value

:aintvl= (optional)

AIN interval index

Range: 1-15

Default: The current value

:dgts= (optional)

Digits

Range: 3-10 digits

000-999, 000000-9999999999

:intvl= (optional)

IN Interval index. The amount of time between ACGs. This number is mapped to a time value for the LNP node.

Range: 0-15

Default: Current value

:nd= (optional)

Number of digits

Range: 3, 6-10

Default: The current value

:serv= (optional)

Query service

Range: ain, in

:type= (optional)

Type of control

Range: all, sd

Default: sd

Example

```
ent-acg-mic:type=all:nd=6:drtn=6:intvl=2:aintvl=7
```

```
ent-acg-mic:serv=ain:dgts=9194602132:drtn=13:aintvl=1
```

```
ent-acg-mic:type=sd:serv=in:dgts=919:drtn=8:intvl=3
```

Dependencies

- If the **type=all** parameter is specified, then the **nd**, **intvl**, and **aintvl** parameters must be specified.
- If the **type=all** parameter is specified, the optional parameters **serv** and **dgts** cannot be specified.
- If the **type=sd** parameter is specified, the optional parameters **serv** and **dgts** must be specified.
- If the **type=sd** parameter is specified, then the **nd** parameter cannot be specified.
- If the **serv=in** parameter is specified, the optional parameter **aintvl** cannot be specified.
- If the **serv=ain** parameter is specified, the optional parameter **intvl** cannot be specified.
- If the **serv=in** parameter is specified, the optional parameter **intvl** must be specified.
- If the **serv=ain** parameter is specified, the optional parameter **aintvl** must be specified.
- The **dgts** parameter value must be specified as 3 or 6–10 digits.
- The **nd** parameter value must be **3** or **6-10**.
- The LNP feature must be turned on before this command can be entered.
- If the **type=all** parameter is specified, then an MIC with the **type=all** parameter cannot already exist.
- If the **type=sd** parameter is specified, a MIC with the same service and digits must not already exist.
- A maximum of 256 **type=sd** MICs are allowed.

Notes

None

Output

```
ent-acg-mic: type=all: nd=6: drtn=6: intvl=2: aintvl=7
rlghncxa03w 04-02-28 08:50:12 EST EAGLE 31.3.0
ACG MIC table is (11 of 256) 4% full of type SD
ENT-ACG-MIC: MASP A - COMPLTD
;
```

ent-acg-noc**Enter ACG Node Overload Control**

Use this command to enter the values for the automatic call gapping (ACG) controls that you want to send when you reach the specified node overload level. The definition is comprised of the threshold LNP query rates for node overload levels and the values for the ACG to be sent when at the level. If a level is not defined, it is not used. Level 10 is predefined.

Keyword: ent-acg-noc

Related Commands: chg-acg-noc, dlt-acg-noc, rept-stat-lnp, rtrv-acg-noc

Command Class: Database Administration

Parameters

:drtn= (mandatory)

Duration index. The amount of time that the ACG is in effect. This number is mapped to a time value at the LNP node.

Range: 1-13

Default: The current value

:intvl= (mandatory)

Interval index. The amount of time between ACGs. This number is mapped to a time value for the LNP node.

Range: 0-15

Default: Current value

- :lvl=** (mandatory)
Overload level.
Range: 1-9
- :qr=** (mandatory)
Query rate. The number of LNP queries, which define a particular overload level, in a 30-second period.
Range: 1-2147483647
- :and=** (optional)
AIN number of digits. The number of digits in the global title address of an AIN query.
Range: 6, 10
Default: 6
- :ind=** (optional)
IN number of digits. The number of digits in the global title address of an IN query.
Range: 6, 10
Default: 6

Example

```
ent-acg-noc:lvl=3:qr=300000:and=10:ind=6:drtn=6:intvl=3
```

Dependencies

The LNP feature must be turned on before this command can be entered.

Either **6** or **10** must be specified for the **and** parameter.

The specified overload level must not already be defined.

Either **6** or **10** must be specified for the **ind** parameter.

Notes

None

Output

```
ent-acg-noc:lvl=3:qr=300000:and=10:ind=6:drtn=6:intvl=3
rlghncxa03w 04-02-28 08:50:12 EST EAGLE 31.3.0
ENT-ACG-NOC: MASP A - COMPLTD
;
```

ent-appl-rtkey**Enter Application Route Key Table**

Use this command to configure static entries in the Routing Key table, which associates a routing key with a socket name.

There are three types of routing keys, as follows:

- DPC, SI, SSN routing keys, which are used to route SCCP messages
- DPC, SI routing keys, which are used to route non-SCCP and non-ISUP messages
- DPC, SI, CIC routing keys, which are used to route ISUP messages

Keyword: ent-appl-rtkey

Related Commands: dlt-appl-rtkey, rtrv-appl-rtkey

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" in Appendix A for a detailed description of point code formats, rules for specification, and examples.

:asname= (mandatory)

Application Server (AS) name assigned to this routing key.

Range: *aaaaaaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter

:cice= (optional)

The end range of circuit identification codes assigned to the routing key.

Range: **0-4294967295**

See Table A-4 for valid CIC values for specified SI and MSU types.

:cics= (optional)

The start range of circuit identification codes assigned to the routing key. This parameter is valid only if **si=4, 5, or 13** and is required if **si=4, 5, or 13** and **type=full**.

Range: **0-4294967295**

See Table A-4 for valid CIC values for specified SI and MSU types.

:dpc= (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **dpca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Destination point code.

:dpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-*

gc, m1-m2-m3-m4-gc). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:dpcn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:opc= (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **opca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:opc/opca/opci/opcn/opcn24= (optional)

Originating point code. This parameter is valid only if **si=4, 5, or 13**, and is required when **si=4, 5, or 13** and **type=full**.

:opci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:open= (optional)

New ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:open24= (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:rcontext= (optional)

Routing context. This parameter specifies a new routing context for a routing key. The routing context uniquely identifies the routing key.

Routing context is mandatory for routing keys associated with SUA Application Servers. Routing context is optional for routing keys associated with M3UA Application Servers.

Range: **0-4294967295**

:si= (optional)

Service indicator.

Range: **1-15**

0-15 or equivalent text values:

Number = Text—Description

0 = snm—Signaling network management messages

1 = regtest—Signaling network testing and maintenance regular

2 = spltest—Signaling network testing and maintenance special

3 = sccp—SCCP

4 = tup—Telephone user part

5 = isup—ISDN user part

13 = qbicc

:ssn= (optional)

Subsystem number. This parameter is valid only if **si=3** and is required if **si=3** and **type=full**.

Range: **0-255**

:type= (optional)

The type of routing key.

Range: **full, partial, default**

Default: **full**

Example

```

ent-appl-rtkey:asname=suaas1:dpc=8-8-8:si=3:ssn=5:rcontext=100
ent-appl-
rtkey:asname=suaas2:dpc=8-8-8:si=3:type=partial:rcontext=101

rcontext=7

```

Dependencies

The **srkq** parameter (see the **chg-sg-opts** command) limits the maximum number of static routing keys that can be provisioned using this command. For SS7IPGW and IPGWI applications running on SSEDCCM, E5-ENET and E5-ENET-B cards, there is a limit of 2500 routing keys in the system.

The **ssn** parameter is valid only when the **si=3** (or **sccp**) parameter is specified. When the **si=3** (or **sccp**) parameter is not specified, the **ssn** parameter cannot be specified.

The value entered for the starting circuit identification code (**cics**) must be less than or equal to the value entered for the ending circuit identification code (**cice**).

The ISUP routing-over-IP feature must be turned on before a DPC/SI/CIC routing key to route ISUP messages can be specified.

A circuit identification code range (**cics** to **cice**) cannot be specified that overlaps an existing routing key.

When the **si=4**, **5**, or **13** (or **tup**, **isup**, or **qbicc**) parameter is specified, the **opc**, **cics**, and **cice** parameters are required. The **opc**, **cics**, and **cice** parameters can be specified only if the **si=4**, **5**, or **13** parameter is specified. See Table A-4 for valid **cic** and **si** values for MSU types.

Partial point codes are not allowed; no asterisks can be specified in the routing key in the command.

Mixed point code types are not allowed; the types for the **opc** and **dpc** parameters must match.

A DPC/SI routing key must be specified when the DPC is ANSI and the **si=4** parameter is specified (TUP is used only in an ITU network).

When the **type=full** parameter is specified, the **dpc** and **si** parameters must also be specified.

The group codes for the **dpc** and **opc** parameter values must match when both parameters are entered in the command.

The **rcontext** parameter must be specified for routing keys that are associated with SUA Application Servers.

The specified **rcontext** parameter value must not already exist in the database.

If specified, the service indicator parameter must be **si=3** for routing keys that are associated with SUA Application Servers.

An AS cannot be simultaneously assigned to a routing key with routing contexts and routing keys without routing context.

To assign an M3UA or SUA association to multiple routing keys with routing context, the M3UA/SUA association must be assigned to more than one AS and each AS must be assigned to a routing key with routing context.

The AS name and parameters specified for a routing key must use an address format that is valid for the adapter type used by the ASP associations assigned to the AS.

If the **type=default** parameter is specified, then the **rcontext** and **aname** parameters are the only optional parameters that can be specified.

The following four types of partial routing keys are supported:

- DPC/SI/OPC (ignore CIC) can be used as a partial match key for CIC- based traffic.
- DPC/SI (ignore all other fields) can be used as a partial match key for CIC- based traffic or SCCP traffic.
- DPC only (ignore all other fields) can be used as a partial match for any type of traffic.
- SI only (ignore all other fields) can be used as a partial match for any type of traffic.

The DPC entered cannot be an APC or SAPC for an IPGWx linkset. Routing keys cannot be provisioned for the fake adjacent node.

An AS can be associated to only one routing key that contains a routing context value.

Notes

The Routing Key table associates a routing key with a socket name or an Application Server (AS).

The routing key can be associated with up to 16 socket names or with 1 AS.

The originating point code (**opc**) and destination point code (**dpc**) must not specify a cluster route.

Group codes are required for ITU-N point codes and spare point codes (DPCN/OPCN) when the ITU Duplicate Point Code feature (ITUDUPPC) is turned on, and not allowed when the feature is off.

Routing context is a routing key parameter that uniquely identifies routing keys. Routing context is mandatory for routing keys associated with SUA Application Servers and optional for routing keys associated with M3UA Application Servers. An AS cannot be simultaneously assigned to routing keys with routing contexts and routing keys without routing contexts.

An AS cannot be simultaneously assigned to a routing key with routing contexts and routing keys without routing contexts.

An AS can be associated with multiple routing keys that do not contain routing context. An AS can be associated with only 1 routing key with routing context. To assign an M3UA or SUA association

to multiple routing keys with routing context, the M3UA/SUA association must be assigned to more than one AS and each AS must be assigned to a routing key with routing context.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Output

```
ent-appl-rtkey:dpc=2-2-2:aname=assoc1:type=partial
rlghncxa03w 08-04-17 15:35:05 EST EAGLE 38.0.0
ENT-APPL-RTKEY: MASP A - COMPLTD
;
```

ent-as

Enter Application Server

Use this command to create an Application Server (AS) as a logical entity to serve a specific routing key. This command enters a new AS into the AS table and assigns an M3UA or SUA SCTP association to it, or assigns an M3UA or SUA SCTP association to an existing AS.

Keyword: ent-as

Related Commands: chg-as, dlt-as, rtrv-as

Command Class: Database Administration

Parameters

:aname= (mandatory)

Name of the M3UA or SUA SCTP association.

Range: ayyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter.

:aname= (mandatory)

Name of the Application Server (AS).

Range: ayyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter.

Example

```
ent-as:aname=asx:aname=asxp1
```

Dependencies

The specified **aname** must exist in the IPAPSOCK table.

The adapter layer for each association assigned to the AS must be defined.

SUA Application Servers must have routing keys with assigned routing contexts.

The service indicator must be **si=3** for routing keys that are associated with SUA Application Servers.

The adapter layer must be the same for all M3UA/SUA associations assigned to the AS.

The value specified for the **aname** parameter cannot refer to an IPLIMx or IPSG association.

The **aname=default** parameter cannot be specified.

An association can be assigned to a maximum of 50 application servers.

Notes

The DCM card has 16 MB of memory. Socket/association limits are based on card memory as is the ratio of associations to sockets. This ratio, known as the trade ratio, defines the number of sockets that are equivalent to one association with respect to memory consumption.

By default the AS recovery timer value is set to 200 ms when an AS is entered. This value can be changed at any time using the **chg-as** command. The new timer value will be used the next time the AS enters the AS-Pending state.

The trade ratio states the quantity of associations to sockets that may be provisioned on a certain card, as follows:

Trade Ratio = a:s

Where:

a=association : s=socket

The maximum sockets/associations per DCM card are:

- Socket to Association Ratio—8:1
- Max Sockets—50
- Max Associations—4

Output

```
ent-as : asame=asx : aname=asxp1
      rlgncxa03w 05-05-17 15:35:05 EST EAGLE 34.0.0
      ENT-AS: MASP A - COMPLTD
;
```

ent-assoc

Enter Association

Use this command to configure the SCTP associations in the IPAPSOCK table. This command associates the local host and local port to a remote host and remote port in the IPAPSOCK table. This command provides the association to transport protocol data units and adapter layer peer messages. Each association is connected to a process on the far end.

Keyword: ent-assoc

Related Commands: chg-assoc, dlt-assoc, rtrv-assoc

Command Class: Database Administration

Parameters

:aname= (mandatory)

Name assigned to this association (in IPAPSOCK table).

Range: aaaaaaaaaaaaaaaaa
Up to 15 alphanumeric characters; the first character must be a letter

:lhost= (mandatory)

The local host name as defined in the IP Host table.

Range:
a-z, A-Z, 0-9, -, .
Any string of characters beginning with a letter and comprising up to 60 characters in length

:adapter= (optional)

The adapter layer for this association.

Range: m3ua, sua, m2pa
Default: m3ua if the lhost is an IPGWx card and the adapter type is not specified.
m2pa if the lhost is an IPLIMx or IPSG card and the adapter type is not specified.

:alhost= (optional)

Name of alternate local host. When specified, this parameter configures the SCTP association as a multi-homed endpoint.

Range: `////////////////////////////////////`

a-z, A-Z, 0-9, -, . or none

Any string of characters beginning with a letter and comprising up to 60 characters in length

none—the **alhost** is not configured; the SCTP association is configured as a uni-homed endpoint

:link= (optional)

The signaling link for this association.

Synonym: **port**

Range: **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling links.

Default: **a**

:lport= (optional)

The SCTP port number for the Local Host.

Range: **1024-65535**

Default: **0**

:m2patset= (optional)

The M2PA timer set assigned to this association.

Range: **1-20**

Default: **1**

:rhost= (optional)

Name of Remote Host as defined in the IP Host table.

Range: `////////////////////////////////////`

a-z, A-Z, 0-9, -, .

Any string of characters beginning with a letter and comprising up to 60 characters in length

:rport= (optional)

The SCTP port number for the Remote Host.

Range: **1024-65535**

Default: **0**

Example

```
ent-
assoc:aname=assoc1:lhost=gw105.nc.tekelec.com:lport=1030 :rhost=gw
100.nc.tekelec.com:rport=1030:adapter=m3ua
```

Dependencies

The association name (**aname**) must already exist in the IP Socket/Association (IPAPSOCK) table.

The hostnames specified in the **lhost** and **alhost** parameters must refer to different IP addresses.

The IP host names specified in the **lhost** and **alhost** parameters must exist in the IP Host table and must be provisioned as local to this EAGLE 5 ISS.

The hostnames specified in the **lhost** and **alhost** parameters must refer to IP addresses on the same IP card.

To assign an association on an IPLIMx card for a local host, the signaling link associated with the signaling link port must have its **ipliml2= m2pa**.

If the **m2patset** parameter is specified, then the **adapter=m2pa** parameter must be specified.

If the card is running an **iplim** or **iplimi** application, then an association with **adapter=sua** or **m3ua** cannot be assigned as a value for the **lhost** parameter.

Association connection parameters (**lhost**, **rhost**, **lport**, **rport**) must be unique.

The card location for the card associated with the **lhost** and **alhost** must exist in the IP Link table.

The allowed maximum is 1 association per signaling link on IPLIMx cards.

There is a maximum of 50 connections (association-to-AS assignments + sockets) per Local Host on IPGWx cards.

A maximum of 4000 connections (association-to-AS assignments + sockets) are allowed per system.

If the value specified for the **lhost** parameter refers to an IPSG card, then the **link** parameter cannot be specified.

A maximum of 32 associations can be provisioned on an IPSG card.

The value specified for the **link** parameter must be valid for the card and application type:

- Link A—card running the SS7IPGW or IPGWI application
- Links A - A3 and B - B3—SSEDCCM card running the IPLIM or IPLIMI application
- Links A - A7 and B - B7—E5-ENET or E5-ENET-B card running the IPLIM or IPLIMI application
- Links A - A15 and B - B15—E5-ENET or E5-ENET-B card running the IPSG application

The value specified for the **host** parameter must begin with an alphabetic character and can contain **a..z**, **A..Z**, **0..9**, - (hyphen), or . (period). If the host name contains a hyphen, then the host name must be enclosed within quotation marks.

Notes

The IPASOCK table is used to associate the Local Host/Local Port to a Remote Host/Remote Port. This fully specifies the connection.

SCTP associations can be configured as either uni-homed or multi-homed endpoints. Uni-homed endpoints are SCTP associations configured with the **lhost** parameter specified and the **alhost** parameter not specified. In this case, the **lhost** represents an IP address that corresponds to either the A or B network of the IP application card (see **chg-ip-lnk**). Multi-homed endpoints are SCTP associations configured with both the **lhost** and **alhost** parameters specified. In this case, the **lhost** represents an IP address corresponding to one of the networks (A or B) of the IP card while the **alhost** represents an IP address corresponding to the other network of the same IP card.

If a valid **lhost** parameter is specified that equates to a valid IP address, the **lhost** maps directly to a card location in the IP Link table, which can then determine the card's application (IPLIMx or SS7IPGWx). If the application is an IPLIMx, two additional validation checks are made:

- The **adapter** parameter value must equal **m3ua** or **m2pa**.
- The **ipliml2** value for the IPLIMx signaling link must be the same as the association **adapter** parameter value.
- The **ipliml2** value for an IPLIMx signaling link cannot be set to **m3ua**.

If the determination of the application running on the card or the signal link cannot be performed when the **ent-assoc** command is executed, the check will be performed by the **chg-assoc** command.

An association with an adapter value of **m2pa** cannot be assigned to an SS7IPGW or IPGWI host.

There are fields in the IPAPSOCK table that receive default values even though there are no parameters on this command for changing those fields. If a different value is desired, the **chg-assoc** command must be used. The **chg-assoc** command can also be used if the hostnames are too long to fit on the command line with other parameters. The fields in question and their default values are:

- open=no
- alw=no
- rmode=lin
- rmin=120
- rmax=800
- rtimes=10
- cwmin=3000
- ver=rfc
- istrms=2
- ostrms=2

For the M2PA RFC feature, when the application is IPLIMx and the **adapter=m2pa** parameter is specified, the supported M2PA version is set to M2PA RFC by default.

Output

```
ent-
assoc:aname=assoc1:lhost=gw105.nc.tekelec.com:lport=1030 :rhost=gw
100.nc.tekelec.com:rport=1030:adapter=m3ua
    rlgncxa03w 04-02-17 15:35:05 EST  EAGLE 31.3.0
    ENT-ASSOC: MASP A - COMPLTD
;
```

ent-card

Enter Card

Use this command to add a card to the database. The card type and application specifies the function assigned to the card.

Keyword: ent-card

Related Commands: chg-card, dlt-card, init-card, rept-stat-card, rmv-card, rst-card, rtrv-card

Command Class: Database Administration

Parameters

NOTE: See Table A-9 for information on valid card types and applications for cards that use the ent-card command.

NOTE: The phrase "Service Module card" refers to a Database Services Module (DSM), E5-SM4G, or E5-SM8G-B card when any of these cards can be used. The cards are provisioned with the type=dsm and appl=vsccp parameters.

:appl= (mandatory)

Application. This parameter specifies the application for the card.

Range: xxxxxxx

1 alphabetic character followed by up to 6 alphanumeric characters. Valid applications are:

atmansi—Used by LIM-ATM, E5-ATM, and E5-ATM-B cards to support ANSI high-speed ATM signaling links. Used by E5-ATM and E5-ATM-B cards to support T1 functions.

atmitu—Used by E1-ATM, E5-ATM, and E5-ATM-B cards to support ITU E1 high-speed ATM signaling links. Used by E5-ATM and E5-ATM-B cards to support E1 functions.

ccs7itu—Used by E1/T1 MIM, HC-MIM and E5-E1T1 cards for ITU-TSS MTP functions.

eroute—Used by STC and E5-STC cards for EAGLE 5 Integrated Monitoring Support functions.

gls—Used by TSM and E5-TSM cards for downloading gateway screening to LIM and Service Module cards.

ipgwi—Used by SSEDCCM, E5-ENET, and E5-ENET-B cards for IP point-to-multipoint connectivity for ITU point codes.

iplim—Used by SSEDCCM, E5-ENET, and E5-ENET-B cards for IP point-to-point connectivity for ANSI point codes.

iplimi—Used by SSEDCCM, E5-ENET, and E5-ENET-B cards for IP point-to-point connectivity for ITU point codes.

ips—Used by IPSM cards for the IP User Interface feature.

ipsg—Used by E5-ENET and E5-ENET-B cards to support the combined functionality of IPLIMx M2PA and IPGWx M3UA.

mcp—Used by MCPM cards for the Measurements Platform feature.

ss7ansi—Used by MPL, E1/T1 MIM, HC-MIM and E5-E1T1 cards for ANSI MTP functions.

ss7ipgw—Application software for TCP/IP point-to-multipoint connectivity.

stplan—Used by DCM, E5-ENET, and E5-ENET-B cards to support STP LAN functions.

vsccp—Used by Service Module cards to support EPAP-based features and LNP features. If no EPAP-based features or LNP features are turned on, and a Service Module card is present, the vsccp GPL processes GTT traffic.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218,

4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:type= (mandatory)

This parameter specifies the type of hardware being added.

Range: **dcm, dsm, enet, ipsm, limatm, limds0, lime1atm, lime1, limt1, limch, mcpm, stc, tsm, enetb**

dcm— Data Communications Module card (SSEDCM, E5-ENET, or E5-ENET-B card). Applications for this card type are **stplan**, **iplim**, **iplimi**, **ss7ipgw**, and **ipgwi**.

dsm— DSM, E5-SM4G, or E5-SM8G-B card to support EPAP-based features, LNP features, and the GTT feature. The application for this card type is **vscep**.

enet— E5-ENET or E5-ENET-B card to support the IP Signaling Gateway. The application for this card type is **ipsg**.

ipsm— IP Services Module card (DSM-1G, E5-IPSM, or E5-ENET-B card) to support the IP User Interface feature. The application for this card type is **ips**.

limatm— LIM-ATM card or E5-ATM card to support high-speed signaling links. The application for this card type is **atmansi**.

limds0— Multi-port LIM (MPL) card to support signaling links with the DS0 interface. The application for this card type is **ss7ansi**.

lime1atm— E1-ATM, E5-ATM, or E5-ATM-B card to support high-speed signaling links. The application for this card type is **ATMITU**.

lime1— E1/T1 MIM or HC-MIM card or E5-E1T1 card used as an E1 card or an SE-HSL card. The application types for this card type are **SS7ANSI** and **CCS7ITU**.

limt1— E1/T1 MIM or HC-MIM card or E5-E1T1 card used as a T1 card. The applications for this card type are **SS7ANSI** or **CCS7ITU**.

limch— E1/T1 MIM card defined as a Channel card. The applications for this card type are **ss7ansi** and **ccs7itu**.

mcpm— EDSM-2G or E5-MCPM-B card used as a Measurement Collection and Polling Module (MCPM) card for the Measurements Platform feature. The application for this card type is **mcp**.

stc— DCM, SSEDCM, E5-ENET, or E5-ENET-B card used as a Signaling Transport Card (STC or E5-STC) for the EAGLE 5 Integrated Monitoring Support feature. The application for this card type is **eroute**.

tsm— TSM card or E5-TSM card used for Gateway Screening. The application for this card type is **gls**.

enetb— E5-ENET-B card to support the IP Signaling Gateway. The application for this card type is **ipsg**.

:force= (optional)

If the **force=yes** parameter is used to add a LIM card to the database, it is recommended that you add the required number of Service Module cards to the database after the LIM card is added to avoid the loss of global title translation (GTT) traffic.

Range: **yes, no**

Default: **no**

Example

```
ent-card:loc=1206:type=limatm:appl=atmansi:force=yes
```

```
ent-card:loc=1208:type=limatm:appl=atmansi:force=no
```

```
ent-card:loc=1105:type=enet:appl=ipsg
```

Dependencies

NOTE: The LNP feature is "turned on" when an LNP ported TNs quantity is shown in the **rtv-ctrl-feat** command output. An LNP quantity feature access key has been enabled and

turned on. See the enable-ctrl-feat command for more information about enabling and turning on the LNP feature.

For features that are enabled with the **enable-ctrl-feat** command, use the **rtrv-ctrl-feat** command to verify whether a feature is enabled or turned on.

For features that are turned on with the **chg-feat** command, use the **rtrv-feat** command to display the **on** or **off** status of the features.

Table A-9 shows the card names, the only valid card type (**type** parameter) and application (**appl** parameter) combinations, the card part numbers, and the maximum number of cards allowed in the database.

The card location must not be **1113-1118**, or xy **09** and xy **10** where x is the frame and y is the shelf.

The specified shelf location must be provisioned and present in the frame.

The specified card location cannot already be provisioned in the database.

The DSM card must be inserted into an odd-numbered location. The $n+1$ slot next to the DSM card must be empty, where n is the odd-numbered location (for example, if the DSM card is in location 1101, then the 1102 slot must be empty and unprovisioned).

The Measurements Platform feature must be turned on before the command can be entered for an MCPM card (**:type=mcpm:appl=mcp**).

The following applications are valid for the **appl** parameter: **ss7ansi**, **gls**, **ccs7itu**, **stplan**, **atmansi**, **iplim**, **iplimi**, **ss7ipgw**, **vsccp**, **atmitu**, **ipgwi**, **ips**, **eroute**, **mcp**, **ipsg**.

The $n+1$ slot next to the DSM or HC-MIM card must be empty, where n is the odd-numbered location (for example, if the DSM card is in location 1101, then the 1102 slot must be empty and unprovisioned).

The GTT feature must be turned on to specify the **appl=vsccp** parameter.

The GWS feature must be turned on to specify the **appl=gls** parameter.

The LAN feature must be turned on to specify the **appl=stplan** parameter.

A valid card type must be specified. See the description for the **type** parameter for a list of valid values.

Table A-9 lists the maximum number of cards of each card type and application that are allowed in the system.

All provisioned shelves must contain HIPR cards before more than 115 LIM-ATM cards can be provisioned.

If the **force** parameter is not specified or has a value of **no**, then the increased GTT TPS from the new card must be within the Eagle current TPS rating.

Notes

ITU Environment

Each DSM card can handle 1700 transactions per second.

The **ent-card** command validates TPS of cards that requests service from a DSM card. The EAGLE 5 ISS adds the current TPS level to the estimated TPS level of the new card. The EAGLE 5 ISS uses the following values to derive the TPS estimate: 53 TPS for low-speed links (cards provisioned as SS7ANSI or CCS7ITU), 480 TPS for ATM/E5-ATM/E5-ATM-B, and 1000 TPS for IPLIM cards. The EAGLE 5 ISS compares the sum to the user-configured threshold (SCCP TPS Threshold) set using the **chg-th-alm** command. The purpose of the SCCP TPS threshold is to generate an alarm if the threshold is exceeded. The SCCP TPS threshold triggers an error message if the resulting TPS level exceeds the threshold.

E3715: Cmd Rej - Insufficient #SCCP cards to support LIM - use FORCE=YES

The **force** parameter can be specified to add the card even if its addition would exceed the SCCP TPS threshold. If the **force=yes** parameter is specified, the command is accepted but the following warning message appears:

```
WARNING: System current rated TPS unable to support additional SS7 card =  
use FORCE=YES.
```

If the **force=yes** parameter is specified, it is recommended that the required number of Service Module cards be added to the database after the LIM card is added. This action avoids the loss of GTT traffic. Another option is to add additional Service Module cards or to increase the SCCP TPS threshold, and then add the LIM card. This action prevents the alarm from being triggered.

For additional information on using the **force** parameter, see Chapter 4, "System Administration Procedures" of the *Database Administration Manual - System Management*.

ANSI Environment

In an ANSI environment with only the G-Flex feature turned on, only DSM cards in the system and the **ansigflex** system option enabled, each DSM card can handle up to 1700 TPS.

LIM Cards

The MPL cards support only the LIMDS0 interface, and the **appl** value must be **ss7ansi**. The MPL cards support 8 ports, namely **a**, **b**, **a1**, **b1**, **a2**, **b2**, **a3**, and **b3**. The **rtrv-card** command displays the status of all ports of the MPL cards.

The EAGLE 5 ISS cannot contain more than 115 provisioned LIM-ATM cards unless every provisioned shelf contains HIPR cards. The EAGLE 5 ISS checks the card configuration when the **ent-card** command is used to add a LIM-ATM card.

Using the **dlt-card** command to reduce the ATM card count takes the card out of service.

STC Cards

STC cards are SSEDCEM, E5-ENET, and E5-ENET-B cards that run the EROUTE application. E5-ENET and E5-ENET-B cards provisioned with **type=stc** can be referred to as E5-STC cards.

The **type=stc** and **appl=eroute** parameters apply only when the EAGLE 5 Integrated Monitoring Support (E5IS) feature is turned on.

An "n+1" STC configuration is required to provide redundancy: therefore, a minimum of two STC cards must be provisioned in the EAGLE 5 ISS. If single-slot STC cards are provisioned in the database, then a minimum of two single-slot STC cards must be provisioned in the EAGLE 5 ISS. For "n+1" redundancy purposes, a dual-slot STC card cannot be used to replace a single-slot STC card, and a DCM card cannot be used to replace an E5-ENET card.

The EAGLE 5 ISS can contain a maximum of 32 STC cards.

E5-STC cards cannot be provisioned on a shelf that contains HMUX cards. If a shelf contains HMUX cards, then any E5-STC cards must be provisioned in shelves adjacent to the shelf containing the cards being monitored. The optimum configuration is to provision half of the STC cards in the previous shelf and half in the next shelf.

If cards other than E5-ENET or E5-ENET-B cards are used as STC cards, then a maximum of 3 cards can be provisioned in a shelf that contains HMUX cards.

HIPR cards must be installed on any shelf that contains E5-STC cards.

HIPR and HMUX cards cannot be used at the same time in the shelf during normal operation.

If a shelf contains HIPR cards, then the STC cards must be provisioned in the same shelf that contains the cards or links being monitored. A maximum of 4 E5-STC cards can be provisioned on a shelf that contains HIPR cards. A maximum of 16 non-E5-ENET/E5-ENET-B cards that are acting as STC cards can be provisioned on a shelf that contains HIPR cards.

If IP signalling links are being monitored, then only single-slot STC cards can be provisioned. HIPR cards must be used in the shelves where the IP links are located.

DCM Cards

The SSEDCCM card occupies only one slot in an EAGLE 5 ISS shelf. The provisioning rules for DCM/STC cards allow provisioning of any slot where a DCM or STC card can physically be inserted. If the slot is provisioned for a DCM card, an E5-ENET or E5-ENET-B card can be inserted instead of a DCM card for the STPLAN application and an E5-ENET, E5-ENET-B, or SSEDCCM card for IPLIM or IPGW applications. The slot located immediately to the right of the card can also be provisioned.

Cards Running the STPLAN Application

DCM, E5-ENET, and E5-ENET-B cards can be provisioned to run the STPLAN application. E5-ENET and E5-ENET-B cards running the STPLAN application can be referred to as E5-SLAN cards.

An "n+1" STP LAN configuration is required to provide redundancy: therefore, a minimum of two E5-SLAN cards must be provisioned in the EAGLE 5 ISS. A minimum of 2 E5-SLAN cards must be provisioned in the EAGLE 5 ISS. For "n+1" redundancy purposes. A DCM card cannot be used to replace an E5-SLAN card.

E5-SLAN cards cannot be provisioned on a shelf that contains HMUX cards. If a shelf contains HMUX cards, then the E5-SLAN cards must be provisioned in shelves adjacent to the shelf containing the cards being monitored. The optimum configuration is to provision half of the E5-SLAN cards in the previous shelf and half in the next shelf.

If DCM cards are used to run the STPLAN application, then up to 16 cards can be provisioned in a shelf that contains HMUX cards.

HIPR cards must be installed on any shelf that contains E5-SLAN cards.

HIPR and HMUX cards cannot be used at the same time in the shelf during normal operation.

If a shelf contains HIPR cards, then the cards used to run the STPLAN application (either DCM or E5-SLAN cards) must be provisioned in the same shelf that contains the cards or links being monitored. A maximum of 2 E5-SLAN cards and up to 16 DCM cards can be provisioned on a shelf that contains HIPR cards.

E5-SM4G/E5-SM8G-B Cards

If an LNP feature quantity that is greater than 192 million numbers and less than 240 million numbers is present in a node, and there is an attempt to insert an E5-SM4G or E5-SM8G-B card, then the card auto-inhibits (see the **alw-card** command).

Two HIPR cards must be installed on each shelf where an E5-SM4G or E5-SM8G-B card is installed.

IPSM Cards

IPSM cards consist of DSM-1G, E5-IPSM, and E5-ENET-B cards.

Two HIPR cards must be installed on each shelf where an E5-IPSM or E5-ENET-B card is installed.

A maximum of three IPSM cards is supported for a single EAGLE 5 ISS node, on any shelf or combination of shelves.

IPSG Cards

IPSG cards consist of E5-ENET or E5-ENET-B cards running the IP Signaling Gateway application (**type=enet** or **enetb** and **appl=ipsg**). The IPSG application combines the functionality of IPLIMx M2PA and IPGWx M3UA.

E5-ATM/E5-ATM-B Cards

E5-ATM and E5-ATM-B cards support ANSI and ITU implementations and can be used to replace the LIM-ATM and E1-ATM cards. LIM-ATM and E1-ATM cards continue to be supported.

The cards can support 2 ATM signaling links, operating at 1 Erlang. If the **b** signaling link is provisioned, then the card slot is no longer compatible with LIM-ATM or E1-ATM cards.

HIPR or HIPR2 cards must be installed on any shelf that contains E5-ATM or E5-ATM-B cards.

IP Signaling Capacity Guidelines

System limits on the total number of cards allowed in the system are not enforced by the **ent-card** command. If the HIPR2 High Rate Mode feature is turned off, then the total IP Signaling TPS for the system must be less than or equal to 500,000 TPS. If the HIPR2 High Rate Mode feature is turned on, then the total IP Signaling TPS for the system must be less than or equal to 750,000 TPS.

E5-TSM Cards

A maximum of eight cards - E5-TSM cards, TSM cards, or a combination of both cards - is supported for a single EAGLE 5 ISS node, on any shelf or combination of shelves, to support the **gls** application for Gateway Screening. Two HIPR cards must be installed on each shelf where an E5-TSM card is installed.

Fast Copy Cards

E5-ENET cards running the IPSG or IPGHC GPL are considered to be *FC-capable*. A card running the IPGHC GPL must be in the IS-NR State before the card can be considered *FC-capable*. This restriction does not apply to cards running the IPSG GPL. An *FC-capable* card is considered *FC-enabled* when Fast Copy monitoring is enabled for the respective GPL.

Service Module Cards

Service Module cards consist of DSM, E5-SM4G, and E5-SM8G-B cards.

Connectivity to a T1200 AS with EPAP version 13.0 or higher is required for greater than 25 Service Module cards.

If the **ent-card** command is issued while an EPAP-based feature is enabled, then a warning is issued only for the provisioning of the 26th Service Module card. The command must be re-entered within 30 seconds to be accepted.

E5-E1T1 Cards

E5-E1T1 cards support ANSI and ITU implementations and can be used to replace the E1/T1 MIM and HC-MIM cards. The E1/T1 MIM and HC-MIM cards continue to be supported.

Each E5-E1T1 card provides access to eight E1/T1 ports. Each card supports only one SE-HSL signaling link on one of the eight ports and it must be link A.

HIPR or HIPR2 cards must be installed on any shelf that contains E5-E1T1 cards.

EPM and EPM-B Based Cards

The E5-ATM, E5-E1T1, E5-ENET, and E5-SM4G cards are based on the EPM. Release 44.0 introduces the E5-ATM-B, E5-ENET-B, and E5-MCPM-B cards, which are based on a new EPM-B. If the Message Flow Control option is provisioned (see the **chg-stpopts** command), the Fan feature is turned on, and fan trays are installed, then the EPM-B cards can co-exist and be hot-swapped with the EPM cards. The E5-ENET-B card running the IPS application and the E5-MCPM-B card do not require Message Flow Control.

MCPM Cards

MCPM cards consist of EDSM-2G and E5-MCPM-B cards. These cards are used to perform Measurements collection and reporting functionality for nodes with a link capacity greater than 2,400 (1,200 if 15 Minute Measurements is enabled). E5-OAM Integrated Measurements is used for nodes with a link capacity of 2400/1200 or less.

E5-MCPM-B cards are considered to be EPM-B based cards and can co-exist or be hot-swapped with EDSM-2G cards.

Output

```
ent-card:loc=1206:type=limds0:appl=ss7ansi

ent-csl**Enter Common Screening List**

Use this command to enter new screening data into the Common Screening List (CSL). The Common Screening List commands are used to tailor certain types of general screening information to specific features.

Keyword: ent-csl

Related Commands: chg-csl, dlt-csl, rtrv-csl, rtrv-ctrl-feat

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

NOTE: The p2 and scpgta parameters are used only by the Prepaid IDP Query Relay feature.

NOTE: The p1 parameter is used only by the IDP Service Key Routing feature.

:ds= (optional)

Digit string. This parameter specifies a unique string of digits that is used by the specified screening feature.

Either the **ds** parameter or the **pc** parameter must be specified. Both parameters cannot be specified in the same command

Range: 1-15 digits
1 - 15 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.

- 1-6 digits—Prepaid IDP Query Relay **ccnc** list
- 1-15 digits—Prepaid IDP Query Relay **gt** list
- 1-10 digits—Prepaid IDP Query Relay **skbcsm** list
- 4 digits—IDP Screening for Prepaid **skts** list
- 1-15 digits—IDP Screening for Prepaid **insl** list
- 1-15 digits—VFLEX **vmpfx** list
- 1-6 digits—Info Analyzed Relay Base **ccnc** list
- 1-15 digits—Info Analyzed Relay Base **gt** list
- 2 digits—Info Analyzed Relay Base **trig** list

Table 5-22 lists valid hexadecimal values for the Info Analyzed Relay Base **trig** list **ds** entries.

:feature= (optional)

Feature name. This parameter specifies the name of the enabled feature for which the command is entered.

Either the **pn** parameter or the **feature** parameter must be specified to identify the feature.

Range: *aaaaaaaaaaaaaaaaaaaaaaaa*
1 alphabetic character followed by up to 24 optional alphanumeric characters, including spaces and special characters, enclosed in double quotation marks (" ").

- IDP Screening for Prepaid
- Info Analyzed Relay Base
- Prepaid IDP Query Relay
- IDP Service Key Routing
- VFLEX

:list= (optional)

This parameter specifies the name of the Common Screening List associated with the feature. The **list** parameter must be specified when the feature uses more than one type of Common Screening List.

Range: **gt, skbcm, ccnc, skts, insl, vmpfx, trig, delpfx**

- gt**— Global Title List
- skbcm**— SK+BCSM List
- ccnc**— CC+NC List
- skts**— SK+TS List
- insl**— In Network Subscriber List
- vmpfx**— Voice Mail Prefix List
- trig**— Trigger List
- delpfx**— Delete Prefix List

The following screening lists are valid for the indicated features:

- **skts, insl**—IDP Screening for Prepaid
- **ccnc, gt**—Prepaid IDP Query Relay and Info Analyzed Relay Base
- **skbcm**—Prepaid IDP Query Relay and IDP Service Key Routing
- **vmpfx**—VFLEX
- **trig**—Info Analyzed Relay Base

The **delpfx** list is not supported at this time. This list should only be used by Tekelec personnel.

:p1= (optional)

Parameter Value 1. This parameter is specific to the feature and list that use the parameter.

Range: *////////*

Valid values for the IDP Service Key Routing feature are:

- **3** or **prepaid1**—Prepaid Portability Type 3 for the SKBCSM list
- **4** or **prepaid2**—Prepaid Portability Type 4 for the SKBCSM list
- **6-35** or **prepaid3-prepaid32**—Prepaid Portability Types 6 through 35 for the SKBCSM list
- **255** or **prepaidno**—No Prepaid Portability Type for the SKBCSM list

Valid values for the Prepaid IDP Query Relay feature are:

- **0, 1**—National or International for the DELPFX list, which is for Tekelec personnel use ONLY.

Default: **prepaidno**

:p2= (optional)

Parameter Value 2. This parameter specifies the IDP Relay Service that is associated with an SKBCSM list DS entry. Multiple IDP Relay Services can be be provisioned for use with NPP. The parameter value can be entered as a number or as a mnemonic.

Range: *zzzzzzzzzz*

1 or **idprcdpn**—IDPRCDPN Service for the SKBCSM list

2 or **idprcdpn2**—IDPRCDPN2 Service for the SKBCSM list

3 or **idprcdpn3**—IDPRCDPN3 Service for the SKBCSM list

4 or **idprcdpn4**—IDPRCDPN4 Service for the SKBCSM list

Default: **idprcdpn**

:p3= (optional)

Parameter 3. The parameter value is specific to the feature and list name that use this parameter. No feature currently uses this parameter.

:pc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **pca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (optional)

Point code. Either the **ds** parameter or a point code parameter must be specified.

:pci= (optional)

ITU international point code with subfields *zone-area-id*.

Range: **0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The point code **0-000-0** is not a valid point code.

zone—**0-7**

area—**000-255**

id—**0-7**

:pcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

*n**n**n**n*—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:pn= (optional)

Part number. This parameter specifies the 9-digit "893xxxxxx" part number of the feature for which the command is entered. The **rtrv-ctrl-feat** command description shows the part number in the command output example.

Either the **pn** parameter or the **feature** parameter must be specified to identify the feature.

Range: **893000000-893999999**

The first 3 digits are **893**. Do not separate the digits with dashes or spaces. The following part numbers are valid for this command:

- **893015501**—IDP Screening for Prepaid
- **893034201**—Info Analyzed Relay Base
- **893016001**—Prepaid IDP Query Relay
- **893016701**—VFLEX

:scpgta= (optional)

Signaling Control Point (SCP) Global Title Address (GTA). This parameter specifies the value used by the SKGTARTG Service Action in IDP Relay IDPRCDPN(X) Services to replace the SCCP CdPA GTA in the outgoing message.

Range: 1-21 digits

1 - 21 hexadecimal digits. Valid digits are **0-9, a-f, A-F**.

Default: **none**

Example

```
ent-csl:feature="Prepaid IDP Query Relay":list=ccnc:ds=123456
```

```
ent-csl:pn=893015001:list=ins1:ds=123456789bcdEF
```

```
ent-csl:feature="Prepaid IDP Query  
Relay":list=skbcsm:ds=0000000056:p2=idprcdpn2:scpgta=896589
```

Dependencies

An enabled feature must be specified using either a valid part number (the **pn** parameter) or feature name (the **feature** parameter). The specified feature must use a Common Screening List.

The feature that is specified in the **feature** parameter must be enabled.

The **list** parameter must be specified for features that use more than one type of screening list.

The value specified for the **list** parameter must be valid for the specified screening feature.

The length of the digit string that is specified for the **ds** parameter must be valid for the screening feature and list type.

A valid **ds** parameter value is required for the specified feature and list type.

The following parameters are allowed with the indicated common screening list type:

- **list=gt—ds** parameter
- **list=ccnc—ds** parameter
- **list=skbcsm—ds** and **scpgta** parameters
- **list=skts—ds** parameter
- **list=insl—ds** parameter
- **list=vmpfx—ds** parameter
- **list=trig—ds** parameter

The leading digit pattern of the value specified for the **ds** parameter must be unique in the specified screening list for the indicated feature.

Each list table is allowed to contain a maximum number of entries:

- IDP Screening for Prepaid
 - **insl**—50 entries
 - **skts**—25 entries
- Prepaid IDP Query Relay
 - **ccnc**—20 entries
 - **gt**—500 entries
 - **skbcsm**—150 entries
- VFLEX
 - **vmpfx**—100 entries
- Info Analyzed Relay Base
 - **ccnc**—20 entries
 - **gt**—500 entries
 - **trig**—150 entries

The **pc** or **ds** parameter must be specified in the command. The parameters cannot be specified together in the command.

The value specified for the feature parameter must be a valid feature name for a feature that uses a Common Screening List. The feature name must be specified as it appears in the **rtrv-ctrl-feat** command output. Enough of the name must be specified to make the name unique when two features begin with the same word or acronym.

The value specified for the **ds** parameter must be unique in the specified screening list for the indicated feature.

The **scpgta** and **pc** parameters cannot be specified together in the command.
 If the **scpgta** parameter is specified, then the **ds** parameter must be specified.

Notes

Table 5-22 lists the decimal values, the hexadecimal values, and the mnemonic for each TRIGTYPE code that can appear in the CSL TRIG list.

Table 5-22. TRIGTYPE Hexadecimal Codes

Hex	Decimal	Mnemonic	Hex	Decimal	Mnemonic
00	0	Unspecified	1A	26	Inter-LATA_Toll_Call.
01	1	All_Calls.	1B	27	World_Zone_Call.
02	2	Double_Introducing_Star.	1C	28	International_Call.
03	3	Single_Introducing_Star.	1D	29	Unrecognized_Number.
04	4	Reserved	1E	30	Prior_Agreement.
05	5	Double_Introducing_Pound.	1F	31	Specific_Called_Party_Digit_String
06	6	Single_Introducing_Pound.	20	32	Mobile_Termination
07	7	Revertive_Call.	21	33	Advanced_Termination
08	8	0_Digit.	22	34	Location
09	9	1_Digit.	23	35	Locally_Allowed _Specific_Digit_String
0A	10	2_Digit.	24	36	Orgination_Atempt_Authorized.
0B	11	3_Digit.	25	37	Calling_Routing_Address_Available.
0C	12	4_Digit.	26	38	Initial_Termination
0D	13	5_Digit.	27	39	Called_Routing_Address_Available
0E	14	6_Digit.	29	40	O_Answer.
0F	15	7_Digit.	29	41	O_Disconnect.
10	16	8_Digit.	2A	42	O_Called_Party_Busy.

ent-cspc

Enter Concerned Signaling Point Code

Use this command to add signaling points to a current broadcast signaling point code group. These point codes are notified of the receipt by the system of subsystem-prohibited (SSP) and subsystem-allowed (SSA) SS7 SCCP management messages from an application at an adjacent signaling point and subsystem. This command can also be used to add new groups to the table.

NOTE: The command must be entered first with the group only (no point code); then the command must be entered again with the group code and the point code.

Keyword: ent-cspc

Related Commands: dlt-cspc, rtrv-cspc

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" in Appendix A for a detailed description of point code formats, rules for specification, and examples.

:grp= (mandatory)

Name of the group. This parameter is a character string associated with this broadcast list.

Range: *ayyyyyyy*

1 alphabetic character followed by up to 7 alphanumeric characters

:pc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: *pca*

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (optional)

Point code.

This parameter is mandatory when the group and point code are entered, after the group has been entered.

:pci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Example

```
ent-cspc:grp=grp01:pc=144-201-001
```

```
ent-cspc:grp=group02:pcn24=10-100-10
```

```
ent-cspc:grp=grp01
```

```
ent-cpsc:grp=grp01:pc=240-3-55
```

```
ent-cspc:grp=grp01:pci=7-233-5
```

```
ent-cspc:grp=grp01:pci=s-7-233-5
ent-cspc:grp=grp01:pcn24=234-56-245
```

Dependencies

Reserved words (for example, “**none**”) cannot be used to name a group.

The specified CSPC Broadcast group name must not exist if a point code is not specified. If the specified group name does not exist, and a point code is not specified, a new group is created.

The Spare Point Code Support feature must be enabled before the spare point code prefix **s-** can be specified for an ITU-I or ITU-N point code.

If the CSPC group name and a point code are specified, the group name must exist in the database.

The specified point code must exist in the Routing Table and cannot already exist in the specified group.

The destination point code must be a full point code (*ni-nc-ncm*).

The concerned signaling point code must have been specified previously as a full point code destination, or it must be a member of a previously specified cluster.

A maximum of 2550 Concerned Signaling Point Code Broadcast groups can be defined.

A maximum of 96 point codes can be defined for each group.

If the ANSI/ITU SCCP Conversion feature is not enabled, then the first point code to be entered defines the network type for the group. All subsequent point codes for the group must be for the same network type.

The ANSI/ITU SCCP Conversion feature must be enabled before the point codes in a group can be of different network types.

The point code must exist in the routing table.

A routeset and link that provides a path to the new CSPC must be configured before the **ent-cspc** command can be entered.

Notes

To broadcast SSPs and SSAs to one or more mated applications, each mate’s point code must be added to the CSPC group. Otherwise the broadcast is not sent to the mate.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

Output

The command must be entered with just the **grp** parameter to define a new group in the database.

```
ent-cspc:grp=grp01
  rlgncxa03w 04-01-07 11:43:04 EST  EAGLE 31.3.0
  ENT-CSPC:  MASP A - COMPLTD
;
```

The command must specify an existing group and a point code to add the point code to the group.

```
ent-cspc:grp=grp01:pc=144-201-001
  rlgncxa03w 04-01-07 11:43:04 EST  EAGLE 31.3.0
  ENT-CSPC:  MASP A - COMPLTD
;
```

ent-dlk**Enter Data Link**

Use this command to add a TCP/IP data link to the database. The TCP/IP data link is used to send copies of SS7 MSUs (selected by the gateway screening feature) to a remote host for further processing.

Keyword: ent-dlk

Related Commands: act-dlk, canc-dlk, dlt-dlk, rept-stat-dlk, rtrv-dlk, tst-dlk

Command Class: Database Administration

Parameters

:ipaddr= (mandatory)

The TCP/IP data link's IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

Range: **1-223, 0-255**
 4 numbers separated by dots
 1-223—first number
 0-255—the other three numbers

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

:auto= (optional)

Automatic. This parameter specifies whether the hardware automatically determines duplex and speed.

NOTE: This parameter is valid only for DCM cards (running the VWXLAN GPL) or E5-ENET or E5-ENET-B cards (running the SLANHC GPL).

Range: **yes, no**
 yes— Duplex and speed are automatically determined.
 no— Duplex and speed are not automatically determined.

Default: **yes**

:duplex= (optional)

This parameter specifies the mode of operation of the interface.

NOTE: This parameter is valid only for DCM cards (running the VWXSLAN GPL) or E5-ENET or E5-ENET-B cards (running the SLANHC GPL).

Range: **half, full**
 half— The mode of operation of the interface is half duplex.
 full— The mode of operation of the interface is full duplex.

Default: **half**

:speed= (optional)

This parameter specifies the bandwidth for the interface in megabits per second.

Range: **10, 100**

Default: 10

Example

```
ent-dlk:loc=1201:ipaddr=196.3.202.45
ent-dlk:loc=1101:ipaddr=192.168.63.11:speed=10:duplex=half
ent-dlk:loc=1107:ipaddr=192.168.63.12:auto=yes
```

Dependencies

The shelf and card must be equipped.

The IP address (**ipaddr**) cannot be in the TCP/IP link table and cannot be a TCP/IP node.

The specified card cannot contain any data links.

The specified card's status must be out of service maintenance disabled (OOS-MT-DSBLD). Enter the **rept-stat-card** command to verify the state of the card.

The specified TCP/IP data link cannot be in the database.

The specified card must be running the **stplan** GPL.

If the **auto=yes** parameter is specified, then the **speed** and **duplex** parameters cannot be specified.

The **speed** and **duplex** parameters must be specified together in the command.

If the **speed=100** parameter is specified, then a DCM card (running the VXWSLAN GPL) or an E5-ENET or E5-ENET-B card (running the SLANHC GPL) must be used.

The first octet of the IP Address cannot be 127. The 127 value represents an IP address for loopback.

Notes

The value of the **ipaddr** parameter cannot match the TCP/IP default router's IP address (the **iprte** parameter of the **ent-ip-node** command).

Output

```
ent-dlk:loc=1201:ipaddr=196.3.202.45
tekelecstp 07-04-03 11:12:34 EST EAGLE 37.0.0
ENT-DLK: MASP A - COMPLTD
```

;

The following example issues an error message because the first octet of the IP address is a loopback address.

```
ent-dlk:loc=1201:ipaddr=127.3.202.45
rlghncxa03w 07-04-03 11:43:04 EST EAGLE 37.0.0
Command Rejected : First octet of IPADDR cannot be 127.
ENT-DLK: MASP A - COMPLTD
```

;

ent-dstn

Enter Destination

Use this command to add a destination address (a destination point code, capability point code, or network cluster address) and the associated destination attributes to the destination point code table.

CAUTION: When using the Network Routing feature, limited network management is provided for point codes not covered by full point code routing, Cluster Routing, or Nested Cluster Routing.

Keyword: ent-dstn

Related Commands: chg-dstn, chg-rte, dlt-dstn, dlt-rte, ent-rte, rept-stat-dstn, rept-stat-rte, rtrv-dstn, rtrv-rte

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:dpc= (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: dpca

Range: p-, 000-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

The asterisk value (*) is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (mandatory)

Destination point code.

:dpci= (mandatory)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (mandatory)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Default: No change to current value.

:aliasa= (optional)

ANSI alias point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. This parameter is not valid if an ANSI (**dpc** or **dpca**) point code is entered.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:aliasa/aliasi/aliasn/aliasn24= (optional)

Alias point code.

:aliasi= (optional)

ITU international alias point code list with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

If an ITU international destination (**dpci**) point code is entered, then the **dpci** and **aliasi** *prefix* subfields cannot be the same (both spare or both non-spare). Up to 2 comma-delimited entries can be entered in the point code list.

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:aliasn= (optional)

ITU national alias point code list in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

If an ITU national destination (**dpcn**) point code is entered, then the **dpcn** and **aliasn prefix** subfields cannot be the same (both spare or both non-spare). Up to 2 comma-delimited entries can be entered in the point code list.

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

n1-n2-n3-n4—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:aliasn24= (optional)

24-bit ITU national alias point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. This parameter is not valid if a 24-bit ITU national (**dpcn24**) point code is entered.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:bei= (optional)

Broadcast exception indicator. This parameter specifies whether the STP broadcasts network management messages to adjacent signaling points.

NOTE: The network management messages contain information about the indicated cluster and any of that cluster's member signaling points that are on its exception list. The messages whose broadcast is determined by this parameter are:

- TFP—transfer prohibited
- TCP—transfer cluster prohibited
- TFA—transfer allowed
- TCA—transfer cluster allowed

Range: **yes, no**

yes— Network management messages are not broadcast

no— Network management messages are broadcast

Default: **yes**— If the DPC is a member whose associated cluster destination has **bei=yes** specified.

no—for DPCs in the cluster or if the DPC is a member whose associated cluster destination has **bei=no** specified or the **bei** parameter is not specified.

:cli= (optional)

The Common Language Location Identifier assigned to this destination.

Range: *ayyyyyyyyyyy*

1 alphabetic character followed by 10 alphanumeric characters

Default: Null string

:domain= (optional)

The network in which the destination entity or node exists.

Range: **ss7**

Default: **ss7**

:elei= (optional)

Exception-list exclusion indicator, for cluster destinations only. This parameter specifies whether the system *excludes* or *includes (maintains)* a dynamic status exception list (x-list) for each cluster route used to reach the member signaling points that make up the cluster.

Range: **yes, no**
 yes — Do not maintain a dynamic status x-list
 no — Maintain a dynamic status x-list

Default: **no**

:homescp= (optional)

This parameter specifies whether the destination point code (DPC) is considered a Home SCP when performing SCCP processing for messages with no Global Title Address Digits (Global Title Indicator (GTI) is set to zero)

This parameter can only be set to "yes" for full DPCs.

Range: **yes, no**
 yes — the DPC is considered a Home SCP
 no — the DPC is not considered a Home SCP

System

Default: **no**

:homesmsc= (optional)

This parameter specifies whether the DPC is considered a Home SMSC when performing SCCP processing for messages with no Global Title Address Digits (GTI is set to zero).

This parameter can only be set to "yes" for full DPCs.

Range: **yes, no**
 yes — the DPC is considered a Home SMSC
 no — the DPC is not considered a Home SMSC

System

Default: **no**

:ipgwapc= (optional)

IP gateway adjacent point code indicator.

Range: **yes, no**

Default: **no**

:ncai= (optional)

Nested cluster allowed indicator. Specifies whether the route to the cluster point code can be different for provisioned members of the cluster. A point code is a member of a cluster point code if it has the same network identifier (NI) and network cluster (NC) values as the cluster point code. This parameter can be specified only for cluster point codes. Nested cluster routing is allowed if this parameter is set to **yes** and the CRMD and NCR features are turned on.

Range: **yes, no**
 yes — The cluster point code is a nested cluster point code. Point codes that are members of this cluster point code can be assigned to route sets that are different from the route set assigned to the cluster point code.
 no — The cluster point code is not a nested cluster point code. Point codes that are members of this cluster point code must be assigned to the same route set assigned to the cluster point code.

Default: **no**

:nprst= (optional)

NM bits reset. This parameter specifies whether the NM bits should be set to **00**.

This parameter applies only to ITU IAM messages. The **nptype=nm** parameter must be specified (see the **chg-tifopts** command) before this parameter can be specified.

Range: **off, on**
off— Do not set NM Bits to **00** in an ITU IAM message if the TIFOPTS **nptype** option value is **nm**
on— Set the NM Bits to **00** in an ITU IAM message if the TIFOPTS **nptype** option value is **nm**

System

Default: **off**

:ppc= (optional)

ANSI proxy point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

The proxy point code must be a full point code.

Synonym: **ppca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:ppc/ppca/ppci/ppcn/ppcn24= (optional)

Proxy point code.

The proxy point code must be a full point code.

:ppci= (optional)

ITU international proxy point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:ppcn= (optional)

ITU national proxy point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:ppcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:prx= (optional)

Proxy point code indicator. This parameter specifies whether a destination is used as a proxy point code.

Range: **yes, no**

yes— The destination is used as a proxy point code.

no— The destination is not used a proxy point code.

Default: **no** - Will not be used as a proxy point code.

:rcause= (optional)

Release cause. This parameter specifies the condition that triggers the sending of a Release message.

If the TIFOPTS **rlcopc** parameter is specified (see the **chg-tifo** command), and a value of **0-127** is specified for the **rcause** parameter, then the **rcause** parameter value overrides the values specified for the TIFOPTS **rcausenp** and **rcausepfx** parameters.

Range: **0-127, none**

none—use the values specified for the TIFOPTS **rcausenp** and **rcausepfx** parameters

System

Default: **none**

:sccpmsgcnv= (optional)

SCCP UDT(S)/XUDT(S) Message Conversion Indicator. This parameter specifies the type of conversion performed on messages for the specified destination.

Range: **none, udt2xudt, xudt2udt, sxudt2udt**

none— conversion is not required on messages for the destination

udt2xudt— convert all UDT(S) messages for the destination to XUDT(S) messages

xudt2udt— convert all non-segmented XUDT(S) messages for the destination to UDT(S) messages

sxudt2udt— convert all segmented and non-segmented XUDT(S) messages for the destination to UDT(S) messages

Default: **none**

:spc= (optional)

ANSI secondary point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*) .

Synonym: **spca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.
The point code **000-000-000** is not a valid point code.

:spc/spca/spci/spcn/spcn24= (optional)

Secondary point code.

:spci= (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:spcn= (optional)

ITU national secondary point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:spcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:splitiam= (optional)

This parameter specifies when and how to split an ITU IAM message into 1 IAM message + 1 SAM message.

This parameter applies only to ITU IAM messages.

Range: 15-31 none
15-31—Maximum number of CdPN digits allowed in the IAM message before splitting occurs. The remaining digits, up to a total of 32, are encoded in the SAM message.
none—the value specified for the TIFOPTS **splitiam** parameter is used to determine when to split the IAM message

System

Default: none

Example

To add destination 8-1-1 with clii of systest1:

```
ent-dstn:dpc=8-1-1:clli=systest1:bei=yes
```

To add destination 8-8-8 with ITU and national aliases:

```
ent-dstn:dpc=8-8-8:aliasi=1-2-3:aliasn=124
```

To add cluster 20-2-*:

```
ent-dstn:dpc=20-2-*:elei=yes:bei=yes
```

To add a destination with an SPC of 100-100-100:

```
ent-dstn:dpc=20-2-2:spc=100-100-100
```

To add nested cluster 21-2-*:

```
ent-dstn:dpc=21-2-*:elei=yes:bei=yes:ncai=yes
```

To add network routing destination 21-*-*:

```
ent-dstn:dpc=21-*-*
```

To add ITU national destination 7654 with a group code of fr and secondary point code of 7050:

```
ent-dstn:dpcn=7654-fr:spc=7050-fr
```

To add ITU-N 24-bit destination 15-100-10:

```
ent-dstn:dpcn24=15-100-10:bei=no
```

To add a 24-bit ITU-N destination with a 24-bit ITU-N secondary point code of 99-99-99:

```
ent-dstn:dpcn24=12-12-12:spcn24=99-99-99
```

To add destination 1-6-1 with a 24-bit ITU-N alias:

```
ent-dstn:dpci=1-6-1:aliasn24=4-4-4
```

To add private ANSI destination point code p-100-100-101:with spare point code alias s-1-123-1

```
ent-
```

```
dstn:dpc=p-100-100-101:spca=2-2-3:aliasi=s-1-123-1:aliasn=128
```

To add spare ITU-I destination point code s-2-100-1 with ANSI alias point code 121-120-120 and ITU-N alias spare point code s-129:

```
ent-
```

```
dstn:dpci=s-2-100-1:spci=s-2-129-9:aliasa=121-120-120:aliasn=s-129
```

To add spare ITU-N destination point code s-231 with ITU-N secondary point code 129, ANSI alias point code 120-120-122, and ITU-I alias spare point code s-2-123-2:

```
ent-dstn:dpcn=s-231:spcn=129:aliasa=120-120-122:aliasi=s-2-123-2
```

To define a destination as a proxy point code:

```
ent-dstn:dpc=11-11-11:prx=yes
```

To associate a proxy point code with a destination point code:

```
ent-dstn:dpc=11-11-11:ppc=2-7-2
```

To add ITU-I destination point code 3-30-3 with ITU-I spare alias s-3-30-3:

```
ent-dstn:dpci=3-30-3:aliasi=s-3-30-3
```

To add ITU-N destination point code 8199-aa with ITU-I aliases s-4-0-7 and 4-0-7:

```
ent-dstn:dpcn=8199-aa:aliasi=s-4-0-7,4-0-7
```

To add destination 11-11-11 with sccpmsgcnv type as udt2xudt:

```
ent-dstn:dpc=11-11-11:sccpmsgcnv=udt2xudt
```

Dependencies

NOTE: A *full point code* contains numerical values for all three segments of the point code.

The ANSI self-ID destination point code for the STP must be defined before ANSI destinations can be entered.

The ITU-I self-ID destination point code for the STP must be defined before ITU-I destinations can be entered.

The ITU-N self-ID destination point code for the STP must be defined before ITU-N destinations can be entered.

The 24-bit ITU-N self-ID destination point code for the STP must be defined before 24-bit ITU-N destinations can be entered. (See the **chg-sid** command.)

The Destination point code table can contain up to 2000 entries.

The destination address must be a full point code or a cluster point code.

The specified destination address cannot already exist in the Destination entity set.

A destination address cannot already be defined as an alias address.

The Spare Point Code Support feature must be enabled before the spare point code prefix **s-** can be specified for an ITU-I or ITU-N destination, secondary, or alias point code.

The specified **dpc** value cannot match the point code, secondary point code, or capability point code of the system.

A destination can have up to two alias point codes. A destination alias point code type (ANSI, ITU-I, ITU-N, ITU-N24) must not match that destination's true point code type. If both alias point codes are defined, the point code types of the aliases must not match.

Alias point codes are supported only for full point code destinations.

Alias point codes for destinations must be full point codes.

An alias point code cannot already be defined as a destination point code.

The format of the specified **dpcn** or **aliasn** parameter must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

If the 7000 Routesets or 8000 Routesets feature is enabled, then the total number of provisioned aliases in the system cannot exceed 8000. If the 10,000 Routesets feature is enabled, then the total number of provisioned aliases in the system cannot exceed 10000.

If an ANSI or ITU-I point code is specified, either the **aliasn** or the **aliasn24** parameter can be specified, but not both.

A 24-bit ITU-N point code cannot have:

- A 14-bit ITU-N alias point code
- An ANSI alias point code

A 24-bit ITU-National point code can have an ITU-I point code alias. This allows conversion of 14-bit ITU-I routing label to 24-bit routing label and vice versa.

An ITU-I point code can have either a 14-bit ITU-N alias or a 24-bit ITU-N alias, but not both.

A 14-bit ITU-N point code cannot have a 24-bit ITU-N alias point code.

An ANSI point code cannot have a 24-bit ITU-N alias point code.

The CRMD feature must be turned on before a cluster destination point code (**ni-nc-***) can be specified.

A cluster destination cannot be defined using the same network identifier (*ni*) and network cluster (*nc*) subfields of any previously defined alias ANSI point codes.

The CRMD (Cluster Routing and Management Diversity) and NCR (Nested Cluster Routing) features must be turned on before the **ncai** parameter can be specified.

If the **ncai=yes** parameter is specified, then the maximum number of provisioned nested clusters must be no greater than 500.

When a cluster point code is specified, the collection of signaling points sharing the same network identifier (*ni*) and network cluster (*nc*) subfields must have the same route set.

Cluster DPCs are not allowed to inherit cluster members that have routes with A or E linkset types.

Network routing is valid only if the Network Routing (NRT) feature is turned on.

When using network routing, if the destination point code has a value of * in the *nc* subfield, the *ncm* subfield must also be * (for example, **dpc=21-*.***).

The **ncai** parameter can be specified only for cluster destinations.

Alias ANSI point codes cannot have the same network identifier (*ni*) and network cluster (*nc*) subfields as a cluster point code that is already defined.

The CRMD feature must be turned on before the **elei** parameter can be specified.

The **elei** parameter can be specified only for cluster destinations (for example **dpc=ni-nc-***).

The **cli** of the destination point code cannot match the **cli** of the system.

A reserved word cannot be specified for the destination identifier (**cli**).

If the corresponding destination for the specified destination point code is an adjacent signaling point (matched a Far End point code in its linkset entity set), the **cli** of the specified destination point code cannot be assigned to any other destination address.

The value of the **dpc** parameter must be a valid point code.

If specified, the **spc** parameter value must be already be configured as a secondary point code in the Secondary Point Code table.

The value specified for the **spc** parameter must be a full point code.

If the **spc** parameter is specified, the **domain=ss7** parameter must be specified.

If the **spc** parameter is specified, then the value specified for the **dpc** parameter must be a full point code.

The network type of the value specified for the **spc** parameter must match the network type of the value specified for the **dpc** parameter.

If an ITU national destination is provisioned and the ITUDUPPC feature is turned on, and if the destination does **not** use an SPC, the group code of the destination must be the same as the group code of the ITU national true point code. For example, if the ITU national true point code has a group code of **ee**, then you can add destinations with group codes of **ee** without using an SPC. Destinations with a group code of **ff**, however, must use an SPC with a group code of **ff**.

The Route table cannot be full.

If an ITU national destination is provisioned and the ITUDUPPC feature is turned on, and if the destination uses an SPC, then the group code of the destination must match the group code of the SPC. For example, if the ITU national true point code has a group code of **ee**, then you can add

destinations with group codes of **ee** without using an SPC. Destinations with a group code of **ff**, however, must use an SPC with a group code of **ff**.

The **ncai** parameter can be specified only for cluster destinations (for example **dpc=ni-nc-***).

The value of the **cli** parameter cannot already exist in the Route table.

The ICNP feature must be turned on before the **icnpxlat**, **cgpafmt**, and **cdpafmt** parameters can be specified.

The NCR feature must be enabled before the **ncai** parameter can be enabled.

If the 6000 Routesets feature is turned on, and the destination point code to be provisioned is above 5000, then the GPSM-II OAM cards must be used.

The **alias** parameter must be specified with a different point code type than the **dpc** parameter. The **aliasa** and **dpca** parameters cannot be specified together in the command. The **aliasi** and **dpci** parameters and the **aliasn** and **dpcn** parameters cannot be specified together in the command if the *prefix* subfields are the same (both are spare or both are non-spare).

The Proxy Point Code feature must be enabled before the **prx=yes** parameter can be specified.

If the **ipgwapc=yes** parameter is specified, then the **prx=yes** parameter cannot be specified.

If the **ipgwapc=yes** parameter is specified, then the **ppc** parameter cannot be specified.

The Proxy Point Code feature must be enabled before the **ppc** parameter can be specified.

If the **ppc** parameter or the **prx=yes** parameter is specified, then the value specified for the **dpc** parameter must be a full point code.

The **spc** and **ppc** parameters cannot be specified together in the command.

The values specified for the **dpc** and **ppc** parameters must have the same network type.

The values specified for the **dpc** and **ppc** parameters must have the same group code.

The number of proxy destinations cannot exceed the value given by the enabled Proxy Point Code quantity feature.

If the value of the **dpc** parameter is a private point code, then the **prx=yes** parameter cannot be specified.

If the value of the **dpc** parameter is a private point code, then the **ppc** parameter cannot be specified.

The **dpc** parameter and the **prx=yes** parameter must be specified before the **ppc** parameter can be specified.

The total number of proxy destinations cannot exceed the total capacity (100) of the Proxy Point Code feature.

If the **prx** parameter is specified, then either **yes** or **no** value must be assigned

Cluster destination point codes cannot inherit cluster members that have routes using proxy linksets.

The spare ITU-I self-ID destination point code for the STP must be defined before spare ITU-I destinations can be entered.

The spare ITU-N self-ID destination point code for the STP must be defined before spare ITU-N destinations can be entered.

A maximum of two aliases can be specified per destination point code.

If the **dpci** parameter is specified, then a combination of ITUI and ANSI aliases cannot be specified.

If the **dpcn** parameter is specified, then a combination of ITUN and ANSI aliases cannot be specified.

Two ITUI or two ITUN aliases can be specified for the same destination point code only if the aliases have different prefixes. One alias must be spare and one non-spare.

The TIF Number Portability feature must be enabled before the **rcause** or **nprst** parameter can be specified.

A TIF feature must be enabled before the **splitiam** parameter can be specified.

The XUDT UDT Conversion feature must be turned on before the **sccpmsgcnv** parameter can be specified.

The value specified for the **ppc** parameter must already exist in the DSTN table and the **prx=yes** parameter must be assigned.

Notes

Upon initial installation of the system, the self point code must be entered before you enter any destination.

When you define a DPC with the unique destination signaling point of a provisioned cluster, the DPC automatically inherits the route set of its cluster if the **ncai** parameter is set to **no**. If the **ncai** parameter is set to **yes**, the provisioned members can have a different route set.

When you define a cluster point code for previously defined destination signaling points, the cluster automatically inherits the unique route set of its members.

For ITU national duplicate point codes, you cannot change a destination's group code. To move a destination from one group to another, provision a new destination that uses the new group code and delete the old destination.

The system requires that the destination point code of each routeset be entered in the database. For example, to enter 6000 routesets in the database, 6000 destination point codes must be entered in the database.

If you have turned on the 5000 Routes feature, prior to provisioning the additional routing table entries, you must issue the **chg-stpopts** command to specify the maximum number of allowed DPCs and dynamic x-list entries.

If the 6000, 7000, 8000, or 10,000 Routesets feature is enabled, then in order to enter more than 2000 destination point codes, the maximum number of point codes that can be configured on the system must be changed to 6000, 7000, 8000, or 10000 respectively, using the **mtpdpcq** parameter of the **chg-stpopts** command.

In this command, only ITU-international and ITU national point codes and aliases support the spare point code subtype prefix (**s-**). Only ITU-international and ITU national point codes support the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**). Aliases do not support the private (internal) point code prefix.

If the Proxy Point Code feature is enabled, then the value specified for the **ppc** parameter or of the **dpc** parameter (when the destination point code is designated as a proxy point code) must be full point codes. Cluster point codes and private point codes are not supported.

Output

The following example shows the display of the destination memory space accounting command completion response with the NCR, NRT, and CRMD features off (disabled) and all Routes and Routesets features off (disabled):

```
ent-dstn:dpc=8-8-8:aliasi=1-2-3:aliasn=124
  rlghncxa03w 04-08-17 15:35:05 EST  EAGLE 31.8.0

```

;

ent-e1

Enter E1 Interface

Use this command to enter an interface into the system for E1/T1 MIM cards, or HC-MIM or E5-E1T1 cards used as an E1 or SE-HSL cards.

NOTE: CRC4, CAS, CCS, encoding, timing source, and NFAS signaling bit options can be set with the command parameters. Do not use the DIP switches, if any, on E1 and Channel cards to define the E1 interface.

NOTE: The E1 card can have a DIP switch called E1BKEN, which is used to enable or disable data transmission on the E1 backplane. Because there is no command parameter that corresponds to the DIP switch, the default value of enabled is assumed. The backplane is enabled for data transmit and receive on E1 port number 1.

NOTE: On an HC-MIM or E5-E1T1 card, E1 ports 1, 3, 5, and 7 (master ports) can be independently channel bridged with their adjacent even-numbered (slave) E1 ports 2, 4, 6, and 8 to allow non-signaling data pass-through.

NOTE: Any of the 8 ports on an HC-MIM or E5-E1T1 card can be specified when the card is used as a standard HC-MIM or E5-E1T1 card. No more than 2 ports on

the HC-MIM or 1 port on the E5-E1T1 card when used as an SE-HSL card can have defined E1 interfaces.

Keyword: ent-e1

Related Commands: chg-e1, dlt-e1, rtrv-e1, tst-e1

Command Class: Database Administration

Parameters

:e1port= (mandatory)

E1 card port number. The value must be a E1 port for which an interface has not been configured on the specified E1 card.

Range: 1-8

Ports 3 through 8 can be specified only for HC-MIM and E5-E1T1 cards.

Any 2 of the 8 ports on an HC-MIM card can be specified when the card is used as an SE-HSL card.

Any 1 of the 8 ports on an E5-E1T1 card can be specified when the card is used as an SE-HSL card.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:cas= (optional)

CAS multiframing (**on**) or CCS (**off**) indicator.

Range: on, off

CAS cannot be specified for HC-MIM and E5-E1T1 cards.

Default: off

:chanbrdg= (optional)

Port bridging status. This parameter indicates whether an odd-numbered E1 port on an HC-MIM or E5-E1T1 card is channel bridged with its adjacent even-numbered E1 port for non-signaling data pass through.

Range: on, off

Default: off

:crc4= (optional)

CRC4 enable or disable indicator.

Range: on, off

Default: on

:e1tsel= (optional)

Timing source. This parameter indicates a master (**external**) or slave (**line**) timing source, or a timing source recovered from the paired master port for channel bridged slave ports.

Range: line, external, recovered

Default: line

:encode= (optional)

Indicator for use of HDB3 or AMI encoding/decoding.

Range: hdb3, ami

AMI encoding is supported for E1/T1 MIM, HC-MIM, and E5-E1T1 cards that are used as E1 cards.

Default: hdb3

:force= (optional)

This parameter specifies to provision an odd-numbered E1 port to channel bridging mode if the adjacent next higher even-numbered port is already provisioned with an E1 interface.

Range: yes, no

:linkclass= (optional)

Link class for links that are assigned to HC-MIM and E5-E1T1 cards (“channelized” links) or SE-HSL cards (“unchannelized” links).

Range: chan, unchan

Default: chan

:minsurate= (optional)

Minimum signal unit rate. This parameter indicates the minimum number of SUs present on a link uniformly distributed. This parameter is valid only when the **linkclass=unchan** parameter is specified for an SE-HSL card.

Range: 500-2000

Default: 1000

:si= (optional)

Value of two Spare International bits of NFAS data.

Range: 0-3

Default: 0

:sn= (optional)

Value of five Spare International bits of NFAS data.

Range: 0-31

Default: 0

Example

```
ent-
e1:loc=1205:e1port=1:crc4=off:cas=on:encode=hdb3:e1tsel=external:
si=2:sn=12

ent-e1:loc=1205:e1port=2:cas=off:encode=ami
ent-e1:loc=1203:e1port=1:chanbrdg=on:e1tsel=recovered
ent-e1:loc=1203:e1port=3:chanbrdg=on:e1tsel=external
ent-
e1:loc=1203:crc4=on:e1port=2:encode=hdb3:e1tsel=line:linkclass=un
chan :minsurate=2000
```

Dependencies

The card location specified by the **loc** parameter must be equipped.

The card specified by the **loc** parameter must be a **lime1** card type.

The port specified by the **e1port** parameter cannot already be equipped with an E1 interface.

The **cas=on** parameter cannot be specified if:

- A value of **3 - 8** is specified for the **e1port** parameter
- The **chanbrdg=on** parameter is specified
- The value specified for the **loc** parameter indicates an HC-MIM or E5-E1T1 card

The **chanbrdg=on** and **cas=on** parameters cannot be specified when the **linkclass=unchan** parameter is specified. The **minsurate** parameter can be specified only when the **linkclass=unchan** parameter is specified.

The **chanbrdg=on** parameter can be specified only for HC-MIM and E5-E1T1 cards.

The **chanbrdg=on** parameter cannot be specified for even-numbered E1 ports.

If the **chanbrdg=on** parameter is specified, then the **e1tsel** parameter must be specified.

If the **chanbrdg=on** parameter is specified, then the **e1tsel=line** parameter cannot be specified.

The **chanbrdg=on** parameter must be specified before the **e1tsel=recovered** parameter can be specified.

Only 2 ports can be used for E1 interfaces on an HC-MIM card that is used as an SE-HSL card. Any 2 of the 8 ports can be used on the SE-HSL card.

If the **chanbrdg=on** parameter is specified for an odd-numbered E1 port on an HC-MIM or E5-E1T1 card, then the **force=yes** parameter must be specified if the adjacent even-numbered port is already provisioned with an E1 interface.

Before the **chanbrdg=on** parameter can be specified for an odd-numbered E1 port on an HC-MIM and E5-E1T1 card, all signaling links assigned to the adjacent even-numbered E1 port must be deleted (see the **dlt-slk** command).

The Fan feature must be turned on before HC-MIM cards that are used as E1 or SE-HSL cards can be used in an EAGLE 5 ISS shelf.

HIPR cards must be equipped in card locations *xy09* and *xy10* (*x* is the frame, *y* is the shelf) on each EAGLE 5 ISS shelf that contains one or more HC-MIM or E5-E1T1 cards that are used as E1 or SE-HSL cards.

An SE-HSL feature quantity must be enabled before the **linkclass=unchan** parameter can be specified for an SE-HSL card.

The **linkclass=unchan** parameter can be specified only for HC-MIM and E5-E1T1 cards.

Channelized and unchannelized E1 ports (mixed mode) are not allowed on a single HC-MIM or E5-E1T1 card (the card cannot be used as an E1 card and an SE-HSL card at the same time).

Only 1 port can be used for E1 interfaces on an E5-E1T1 card that is used as an SE-HSL card. Any 1 of the 8 ports can be used on the SE-HSL card.

E1 ports **3 - 8** (**e1port** parameter) can be specified for only HC-MIM and E5-E1T1 cards.

Card locations 1113 1114, 1115, 1116, 1117, 1118 (OAM, TDM, MDAL cards) cannot be specified as values values for the **loc** parameter.

The **encode=ami** parameter is supported only for E1/T1 MIM cards and HC-MIM and E5-E1T1 cards used as E1 cards.

Locations *xy09* and *xy10*, where *x* is the shelf and *y* is the slot, cannot be specified as values for the **loc** parameter.

Notes

One or two E1 interfaces must be defined on an E1 card after the E1 and any associated Channel cards types (**lime1** and **limch**) are defined in the database (see the **ent-card** command), and before the signaling links and associated timeslots are defined for the E1 card and any associated Channel cards (see the **ent-slk** command).

When the **e1tsel=external** parameter is specified, a user-supplied BITS clock is required.

External timing is derived from the EAGLE High-Speed Master Clock (1.544 MHz for T1 or 2.048 MHz for E1); therefore, the Master Timing feature is required. Line timing is derived from its received data stream, if present.

Up to 8 E1 interfaces can be defined on an HC-MIM or E5-E1T1 card used as a E1 card after the E1 card type (**lime1**) is defined in the database (with the **ent-card** command), and before the signaling links and associated timeslots are defined for the E1 card .

On a HC-MIM or E5-E1T1 card, E1 ports 1, 3, 5, and 7 (master ports) can be independently channel bridged with their adjacent even-numbered (slave) ports 2, 4, 6, and 8 to allow non-signaling data pass-through. The **chanbrdg** parameter must be specified for the odd-numbered E1 port.

For an SE-HSL card, the **minsurate** parameter indicates the least number of SUs present on a link uniformly distributed. The number of SUs present is the **minsurate** parameter value (without link traffic) or the **minsurate** parameter value minus the number of MSUs (with link traffic).

Output

```
ent-
e1:loc=1205:e1port=1:crc4=off:cas=on:encode=hdb3:e1tsel=external:
si=2:sn=12
  rlgncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0

;
```

ent-frm-pwr

Enter Frame Power Threshold

Use this command to add a new entry to the Frame Power Threshold (FPT) table. The frame-level power threshold value in the table is compared with the current calculated maximum power consumption for a particular frame, and appropriate alarms are raised if that consumption exceeds the threshold limit.

The entries in the Frame Power Threshold table contain a Frame ID and the corresponding power threshold value. You can use the following commands to display the threshold and calculated maximum power consumption for the frames in the system.

- The **rtrv-frm-pwr** command displays the current provisioned frame power threshold for each provisioned frame.
- The **rtrv-stp:display=power** command displays the provisioned frame power threshold for each provisioned frame, and displays the maximum calculated power consumption for each frame, based on card population.
- The **rtrv-stp:display=power:frm=xxxx** command displays the provisioned frame power threshold for the specified frame, the maximum calculated power consumption for the frame based on card population, and the maximum power consumption for each card in the frame and for a fan assembly for each shelf.

NOTE: The frame-level power threshold value needs to be determined from the capacity in Amps of the fuse alarm panel (FAP) for the frame. Contact your site engineer to determine the FAP capacity.

Keyword: ent-frm-pwr

Related Commands: chg-frm-pwr, dlt-frm-pwr, rtrv-frm-pwr, rtrv-stp

Command Class: Database Administration

Parameters

:frm= (mandatory)

Frame ID.

Range: cf00, ef00, ef01, ef02, ef03, ef04

cf00 — Control frame

ef00— First extension frame
ef01— Second extension frame
ef02— Third extension frame
ef03— Fourth extension frame
ef04— Fifth extension frame

:thrshld= (optional)

Threshold. This parameter specifies the frame-level power threshold value, in Amps. This value is compared with the current calculated maximum power consumption for a particular frame (use the **rtrv-stp:display=power:frm=** command to obtain the maximum power consumption value), and the appropriate alarms are raised if current consumption exceeds the threshold limit. The value of the **thrshld** parameter needs to be determined from the capacity of the fuse alarm panel (FAP) for the frame. Contact your site engineer to determine the frame FAP capacity.

Range: 30-65

Default: 30

Example

Enter the frame power threshold value for the first extension frame.

```
ent-frm-pwr: frm=ef00: thrshld=55
```

Dependencies

The specified power threshold value (**thrshld** parameter) must not already be provisioned for the specified frame .

The specified frame (**frm** parameter) must be a provisioned frame.

Notes

The maximum calculated power for a frame is based on the cards that are populated in the system, and includes a fan tray assembly for every shelf (the system cannot detect the presence or absence of a fan tray, and assumes presence for the calculation). These values are typically much higher than the actual power being drawn; the values cannot be used as a gauge of the actual power consumption of the EAGLE 5 ISS.

Output

```
ent-frm-pwr: frm=ef00: thrshld=55
tekelecstp 06-04-11 15:18:41 EST EAGLE 35.0.0
FRAME POWER THRESHOLD table is (4 of 10) 40% full
ENT-FRM-PWR: MASP A - COMPLTD
;
```

ent-ftp-serv

Enter FTP Server Entry

Use this command to write an entry into the FTP Server table for an FTP Server.

NOTE: The FTP Serve table entry for the FTP-based Table Retrieve Application (FTRA) is entered through input from FTRA. Though the entry can be made with this command at the EAGLE 5 ISS, the information entered at the EAGLE 5 ISS will be overwritten by the information sent by FTRA.

Keyword: ent-ftp-serv

Related Commands: chg-ftp-serv, dlt-ftp-serv, rtrv-ftp-serv

Command Class: Database Administration

Parameters

- :app=** (mandatory)
Application. This parameter specifies the FTP Client application that interfaces with the FTP server.
Range: **meas, user, db, dist**
meas — Measurements Platform application
user — FTP-based Table Retrieve Application (FTRA)
db — Database Backup\Restore application
dist — EAGLE 5 ISS Software Release Distribution application
- :ipaddr=** (mandatory)
IP Address of the FTP Server.
Range: 4 numbers separated by dots, with each number in the range of **0-255**.
- :login=** (mandatory)
FTP Server Username (A prompt for entering a password appears on a separate line.)
Range: `////////////////`
1 to 15 alphanumeric characters; mixed-case is allowed
- :path=** (mandatory)
FTP path used to locate the file that will be sent.
Range: `////////////////////////////////////
////////////////////////////////////`
Up to 100 characters; mixed-case string in double quotes with valid FTP path format
Default: User's home directory
- :prio=** (mandatory)
Priority of this FTP server when there is more than one FTP Server for this application.
Range: **1-10**

Example

```
ent-ftp-
serv:app=meas:ipaddr=1.255.0.102:login=ftpmeas1:path="~meas":prio
=1

ent-ftp-serv:app=user:ipaddr=1.255.0.102:login=tekperson1:path=""~
\data":prio=1

ent-ftp-
serv:app=dist:ipaddr=192.168.53.195:login=pvftp:prio=1:path="/
remote/labftp1/pvftp/dallen2ftp"

ent-ftp-
serv:app=db:ipaddr=192.168.53.195:login=pvftp:prio=1:path="/
remote/labftp1/pvftp/aholden"
```

Dependencies

- A separate prompt appears for you to enter the FTP server password that will be used with the FTP Server Username (**login**). You must enter a password that is at least 1 and not more than 15 characters long. If you enter an invalid password (you press the Return key without entering a password, or you enter more than 15 characters), you must enter the entire command again to cause the password prompt to appear again. The password that you enter is not displayed as you enter it.
- An entry for the specified application ID at the specified priority cannot already exist.
- An entry for the specified application ID at the specified IP address cannot already exist.
- The **app** parameter must specify an application that uses the FTP Support feature.

The **ipaddr** parameter must specify a valid IP address for the FTP server.

The **path** parameter value must be in a valid FTP path format.

The **prio** parameter specifies a priority for use of an FTP server by an application when the application has more than one FTP server defined in the table. Each FTP server defined for use by the application must have a priority from 1 to 10 assigned. The available FTP server with the highest priority (smallest number) will be used first by the application.

The FTP Server table can contain entries for a maximum of 10 FTP servers: however, the number of FTP servers supported by an application may be less than 10. Entries that are made for an application cannot be made for more than the maximum number of FTP servers supported by the application.

- The Measurements Platform application (**app=meas**) supports 3 FTP servers.
- The FTP-based Table Retrieve Application (FTRA) (**app=user**) supports 2 FTP servers.
- The Database (**app=db**) and Software Distribution (**app=dist**) applications each support 1 FTP server.

Notes

The same FTP server can be defined more than once, but the specified application must be different for each entry.

Output

```
ent-ftp-
serv:app=meas:ipaddr=1.255.0.102:login=ftpmeas1:path=~meas:prio=1
    rlghncxa03w 04-02-20 09:07:58 EST  EAGLE 31.3.0

ent-gserv-data

Enter G-Port SRI Query for Prepaid Service Data

Use this command to enter translation type, originating point code, or global title address data in the GSERV table. These values are used to determine whether a Send Routing Information (SRI) request should receive G-Port SRI Query for Prepaid service or normal G-Port SRI service.

Keyword: ent-gserv-data

Related Commands: dlt-gserv-data, rtrv-gserv-data

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:gta= (optional)

Global title address. Use this parameter to specify a calling party (CgPA) global title address.

Range: 1-21 digits

:opc= (optional)

ANSI originating point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code *prefix-ni-nc-ncm*.

Synonym: *opca*

Range: *p-*, **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.

The point code **000-000-000** is not a valid point code.

:opc/opca/opci/opcn/opcn24= (optional)

Originating point code. Use these parameters to specify message transfer part (MTP) originating point codes.

:opci= (optional)

ITU international originating point code with subfields *zone-area-id*.

Range: *s-*, *p-*, *ps-*, **0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:open= (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range: *s-*, *p-*, *ps-*, **0-16383**, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:open24= (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:tt= (optional)

Translation type. Use this parameter to specify a called party (CdPA) translation type.

Range: **0-255**

Example

```
ent-gserv-data:tt=26
```

```
ent-gserv-data:opc=1-1-1
```

```
ent-gserv-data:gta=9194605500
```

Dependencies

Duplicate entries cannot exist in the GSERV table.

The G-Port SRI Query for Prepaid feature must be enabled before this command can be entered.

A new entry cannot be added to the GSERV table because all available space is in use. A maximum of 256 **tt** values, 50 **gta** values, and 50 **opc** values can be entered in the GSERV table.

The **tt**, **opc**, and **gta** parameters cannot be specified within the same command.

The G-Port feature must be enabled before this command can be entered.

Notes

A translation type, originating point code, or global title address (**tt**, **opc**, or **gta** parameter) value must be entered in the GSERV table and must match the corresponding SRI Query parameter for an SRI message to receive the G-Port SRI Query for Prepaid service.

The G-Port SRI Query for Prepaid feature must be on before entries in the GSERV table can be used to affect a G-Port SRI query

Output

```
ent-gserv-data:tt=26
```

```
mystp 06-07-27 22:58:17 EST EAGLE 35.2.0
```

```
ENT-GSERV-DATA: MASP A - COMPLTD
```

ent-gsmmap-scrn

Enter GSM MAP Screening Entry

Use this command to assign the GSM (Global System for Mobile Telecommunication) MAP (Mobile Application Part) screening entries that filter or allow TCAP messages for certain MAP operation codes. The messages are filtered or allowed based on CgPA GTA+NPV+NAIV, CdPA GTA+NPV+NAIV, and forbidden (**forbid**) parameters. Each CgPA entry is associated with one or more CdPA entries and one or more CgPA entries are associated with a MAP Opcode. This command provisions both CgPA and CdPA entries into the database.

Keyword: ent-gsmmap-scrn

Related Commands: chg-gsmmap-scrn, chg-map, dlt-gsmmap-scrn, dlt-map, rtrv-gsmmap-scrn, rtrv-map

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:cgsr= (mandatory)

CGPA screening reference. This parameter specifies a CGPA entry for an OPNAME.

Range: *ayyy*

1 alphabetic character and up to 3 optional alphanumeric characters

:opname= (mandatory)

Operation code name. This parameter references the operation code (**opcode**) defined with the **ent-gsms-opcode** command. GSM Map Screening is performed on the specified address or addresses for the referenced operation code.

Range: *aaaaaaaa*

Up to 8 alphanumeric characters

:action= (optional)

The screening action to take if a message is forbidden as defined by the **forbid** parameter.

Range: **atierr, discard, dupdisc, duplicate, forward, pass, route**

atierr — Generate an ATI reject message. This option is only valid for ATI MAP operation codes.

discard — Discard the MSU

dupdisc — Route the original message to the duplicate node. The original message will not be sent to the original node. If, however, the duplicate node is not available for routing, the MSU is discarded.

duplicate — Route the message as normal to the original destination and route a copy of the original message to the duplicate node. If the MSU fails to route to the duplicate node, a UIM is generated indicating the duplicate routing failure.

forward — Route the original message to the forward node. The original message will not be sent to the original node. If, however, the forward node is not available for routing, the MSU is routed to the original node.

pass — Route the message as normal to the destination.

route — Route the message as normal to the original destination node; no UIM will be generated. The original destination is the node to which normal GTT would be sent if no GSM MAP actions are taken.

Default: **discard**

:cdsr= (optional)

CDPA screening reference. This parameter specifies a CDPA entry for a combination of CGSR and OPNAME.

Range: *ayyy*

1 alphabetic character and up to 3 optional alphanumeric characters

:eaddr= (optional)

Ending CDPA address. This parameter is used with the **npv**, **naiv**, **cgsr**, and **cdsr** parameters.

Range: 1-15 digits

Valid digits are **0-9, a-f, A-F**

:forbid= (optional)

Forbidden parameter value. This parameter specifies a forbidden parameter for the entered address. If a forbidden parameter is detected, then the message is rejected by the action defined by the **action** parameter.

Range: **all, none, state, location**

all— All parameters are forbidden. Take the specified screening action defined by the **action** parameter for messages arriving at the system.

none— None of the parameters are forbidden. Route the message to its destination.

state— Take the specified screening action defined by the **naction** parameter for messages arriving at the system that contain **state** as the forbidden parameter for the entered address/operation code combination. Note: The **state** parameter is valid only for GSM ATI messages.

location— Take the specified screening action defined by the **naction** parameter for messages arriving at the system that contain **location** as the forbidden parameter for the entered address/operation code combination. Note: The **location** parameter is valid only for GSM ATI messages.

Default: **all****:force=** (optional)

Check Mated Application Override. This parameter must be used to complete command execution if the **pc/pca/pci/pcn/pcn24** and **ssn** parameter combination (when the **ssn** parameter has a value other than **none**) specified in the command is not already defined in the SCCP Application entity set (Remote Point Code/Mated Application Table).

Range: **yes, no****Default:** **no****:mapset=** (optional)

MAP set ID.

Range: **1-36000 dflt**
dflt—Default MAP set**:naiv=** (optional)

Nature of Address value for the address or range of CgPA and CdPA addresses. If a message is screened and does not contain matching **npv** and **naiv** values, the message is rejected. The message is rejected with the default action defined by the **ent-gsms-opcode** command for the operation code (**opcode**) parameter entry referenced by the operation name (**opname**) parameter.

This parameter must be specified with the **npv** parameter.

Range: **0-127, *****Default:** *******:npv=** (optional)

Numbering Plan value for the address or range of CgPA and CdPA addresses. If a message is screened and does not contain matching **npv** and **naiv** values, the message is rejected. The message is rejected with the default action defined by the **ent-gsms-opcode** command for the operation code (**opcode**) parameter entry referenced by the operation name (**opname**) parameter.

This parameter must be specified with the **naiv** parameter.

Range: **0-15 *****Default:** *******:pc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **pca****Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (optional)

Point code. The **pc/pca/pci/pcn/pcn24** and **nssn** parameters are used when the default screening action (**dfltact**) is **forward**, **duplicate**, or **dupdisc** (duplicate and discard). These parameters are used to enter the node to which the input message will be routed.

:pci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:ri= (optional)

Routing indicator. This parameter specifies whether a subsequent global title translation is required. This parameter can be specified only when the value specified for the **action** parameter is **forward**, **duplicate** or **dupdisc**.

Range: gt, ssn

System

Default: ssn

:saddr= (optional)

Starting origination address.

With the **npv**, **naiv**, and **cgsr** parameters, this parameter is for a single CGPA entry or the starting CGPA address in the range to be screened.

With the **npv**, **naiv**, and **cdsr** parameters, this parameter is for a single CDPA entry or the starting CDPA address in the range to be screened.

Range: 1-15 digits, *
Valid digits are **0-9, a-f, A-F**

Default: *

:ssn= (optional)

Subsystem Number. The Point Code and **ssn** parameters are used when the screening action (**action**) is **forward**, **duplicate**, or **dupdisc**. These parameters are used to change the defined node where the input message will be routed.

Range: 002-255 none

Default: none

:tt= (optional)

Translation type. This parameter specifies the value that the CdPA TT is set to as the result of Enhanced GSM Map Screening.

This parameter can be specified only if the value specified for the action parameter is forward, duplicate, or dupdisc.

Range: 0-255 none

Default: none

Example

The following example adds a MAP opname of ati with a range of allowed addresses, defines a forbidden parameter for that range of addresses and an action to take if the forbidden parameter is detected, and sets the npv and naiv values. This example is wrapped to the next line for readability:

```
ent-gsmmap-
scrn:saddr=919461:eaddr=919462:opname=ati:action=discard:forbid=
tate :npv=1:naiv=4:cgsr=fela
```

The following example adds a MAP opname of ati with a range of allowed addresses, defines a forbidden parameter for that range of addresses and an action to take if the forbidden parameter is detected, and sets the npv and naiv values. The command also defines an ITU International Point Code with Subsystem Number 5, and forbids by location messages that have an action of forward. This example is wrapped to the next line for readability:

```
ent-gsmmap-
scrn:saddr=919461:eaddr=919462:opname=ati:action=forward:pci=1-1-
1 :ssn=5:force=yes:forbid=location:cgsr=fela
```

The following example adds a MAP opname of xyz with an allowed hexadecimal address of abcdefabcdefabc, defines the action discard to take if a forbidden parameter is detected, and sets the

npv and naiv values. The command also defines a CGSR of fela. This example is wrapped to the next line for readability:

```
ent-gsmmap-
scrn:opname=xyz:saddr=abcdefabcdefabc:npv=10:naiv=10:cgsr=fela :ac
tion=discard

ent-gsmmap-
scrn:opname=test2:cgsr=t1:cdsr=cd3:saddr=125:pci=s-1-1-1:ssn=10 :a
ction=duplicate

ent-gsmmap-
scrn:opname=test2:cgsr=cg1:cdsr=cd1:saddr=125:pci=1-1-1:ssn=10:ac
tion=duplicate:mapset=11

ent-gsmmap-
scrn:opname=test3:cgsr=ad:action=forward:pc=1-1-2:ssn=12:ri=gt

ent-gsmmap-
scrn:opname=test4:cgsr=ks1:action=forward:mapset=df1t:pc=1-2-3:ss
n=12:tt=11
```

Dependencies

The GSM Map Screening feature must be turned on before this command can be entered.

The EGMS feature must be turned on before:

- The **saddr**=* parameter can be specified.
- Values for the **saddr** and **eaddr** parameters can contain hexadecimal digits.
- The **cdsr** parameter can be specified.
- The **pc/pca** parameter can be specified.

If the **eaddr** parameter is specified, the **saddr** parameter must be specified.

If the **eaddr** parameter is specified, then its value must contain the same number of digits as the value of the **saddr** parameter.

If the **eaddr** parameter is specified, its value must be greater than the **saddr** parameter value.

If the **saddr**=* parameter is specified, then the **eaddr** parameter cannot be specified.

If the **opname** parameter is specified, its value must exist in the GSM MAP Op-Code table.

A value of **state** or **location** cannot be specified for the **forbid** parameter unless the operation code (**opcode**) referenced by the **opname** parameter is **71**.

The **action=atierr** parameter cannot be specified unless the operation code (**opcode**) referenced by the **opname** parameter is **71**.

The GSM MAP Screening table cannot be full.

The GSM MAP Screening table must have at least two free entries to provision a CgPA entry, because a default wildcard CdPA entry is created for each CgPA entry.

If a single entry is specified for the CgPA/CdPA (the **eaddr** parameter is not specified), then the combination of **saddr/npv/naiv** and **opname** parameters cannot already exist in the GSM MAP screening table.

If a range entry is specified for the CgPA/CdPA (the **eaddr** parameter is specified), then the **saddr/eaddr/npv/naiv** and **opname** combination cannot already exist or overlap another range entry in the GSM MAP screening table.

If a CdPA entry is being created, then the CGSR must already exist for the specified OPNAME.

If a CgPA entry is being created, the CGSR cannot already exist for the specified OPNAME.

The specified **cdsr** cannot already exist for the specified **cgsr**.

If specified, the **pc/pca/pci/pcn/pcn24** parameter must be a full point code.

If the **action** parameter is specified and its value is **forward**, **duplicate**, or **dupdisc**, the **pc/pca/pci/pcn/pcn24** parameter and the **ssn** parameter must be specified.

The **pc/pca/pci/pcn/pcn24** parameter and the **ssn** parameter can be specified only if the **action** parameter is specified and its value is **forward**, **duplicate**, or **dupdisc**.

The **force** parameter can be specified only if the **pc/pca/pci/pcn/pcn24** parameter and the **ssn** parameter are specified.

If the **pc/pca/pci/pcn/pcn24** parameter and the **ssn** parameter are specified, and the **force** parameter is not specified as **yes**, then the PC/SSN must be populated in the SCCP Application entity set (Remote Point Code/MAP Table).

The values for the **npv** and **naiv** parameters must be both numbers or both asterisks (*).

If specified, the **pc/pca/pci/pcn/pcn24** parameter value must exist as a destination in the Ordered Route entity set or reside in a cluster (ANSI only) that exists as a destination in the Ordered Route entity set (for global title routing).

If the **action** parameter is specified as **forward**, **duplicate**, or **dupdisc**, then the **mapset** parameter must be specified.

If the **mapset**, **ri**, or **tt** parameter is specified, then the value specified for the **action** parameter must be **forward**, **duplicate**, or **dupdisc**.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

The specified MAP set must exist.

If the value of the **mapset** parameter is not **dflt**, then the specified PC/SSN must exist in the specified MAP set.

If the **mapset=dflt** parameter is specified, and the **force** parameter is not specified as **yes**, then the specified PC/SSN must exist in the specified MAP set.

If the **action** parameter has a value of **forward**, **duplicate**, or **dupdisc**, then the value specified for the **pc/pca/pci/pcn/pcn24** parameter cannot be associated with a proxy point code.

If the **ri=ssn** parameter is specified, then the **ssn=none** parameter cannot be specified.

If the **forbid=none** parameter is specified, then the value specified for the **action** parameter must be **pass**.

If the Flexible GTT Load Sharing feature is enabled, the **mapset** parameter is specified, and the **ssn** parameter is not specified or has a value of **none**, then the specified MAPSET/PC combination must already exist in the MAP table.

If the Flexible GTT Load Sharing feature is not enabled and the **ssn** parameter is not specified or has a value of **none**, then the specified point code must already exist in the MAP table.

Notes

GSM screening entries are handled differently from other screening entries such as GWS (gateway screening) in the system database. The following differences apply to provisioning GSM screening entries:

- GSM screening entries can be either single entries or range entries.
- Single entries have precedence in screening over range entries. Thus the single entries are searched first and if a match is found, the range entries are never searched.

- Range entries can overlap single entries.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Output

```
ent-gsmmap-
scrn:opname=test2:cgsr=cg1:cdsr=cd1:saddr=125:pci=1-1-1:ssn=10:action=duplicate:mapset=11

;
```

ent-gsms-opcode

Enter GSM MAP Screening Operation Code

Use this command to assign the concerned GSM (Global System for Mobile Telecommunication) MAP (mobile application part) screening operation codes and the default screening action for the operation code. This command allows the craftsperson to provision a list of all operation codes that the system uses in performing GSM screening.

Keyword: ent-gsms-opcode

Related Commands: chg-gsms-opcode, dlt-gsms-opcode, rtrv-gsms-opcode

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:opcode= (mandatory)

MAP operation code. This parameter refers to the actual decimal value of the MAP operation codes from the TCAP layer of GSM MAP messages.

Range: 0-255 *

If a decimal Map Opcode is not found in the database, then the asterisk (wildcard *), if provisioned, will constitute a match when screening the MSUs.

:opname= (mandatory)

Operation code name. The **opname** value is defined with the **ent-gsmmap-scrn** command.

Range: ayyyyyy

Up to 8 alphanumeric characters

:dfltact= (optional)

Default screening action for a MAP operation code. The default screening action is used when a matching CGPA address+NPV+NAIV entry is not found in the GSM MAP screening table.

Range: **atierr, discard, dupdisc, duplicate, forward, pass, route**

atierr — Do not route the MSU. An ATI (Any Time Interrogation) reject message is generated. This option is only valid for ATI MAP operation codes.

discard — Do not route the MSU. The MSU is discarded (thrown away) and an appropriate UIM is issued.

dupdisc — Route the original message to the duplicate node. The original message will not be sent to the original node. If, however, the duplicate node is not available for routing, the MSU is discarded.

duplicate — Route the message as normal to the original destination and route a copy of the original message to the duplicate node. If the MSU fails to route to the duplicate node, a UIM is generated indicating the duplicate routing failure.

forward — Route the original message to the forward node. The original message will not be sent to the original node. If, however, the forward node is not available for routing, the MSU is routed to the original node.

pass — Route the message as normal to the destination.

route — Route the message as normal to the original destination node; no UIM will be generated. The original destination is the node to which normal GTT would be sent if no GSM MAP actions are taken.

Default: **discard**

:force= (optional)

Check Mated Application Override. This parameter must be used to complete command execution if the **pc/pca/pci/pcn/pcn24** and **ssn** parameter combination (when the **ssn** parameter has a value other than **none**) specified in the command is not already defined in the SCCP Application entity set (Remote Point Code/Mated Application Table).

Range: **yes, no**

Default: **no**

:mapset= (optional)

MAP set ID.

Range: **1-36000 dflt**
dflt—Default MAP set

:pc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **pca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (optional)

Point code. The **pc/pca/pci/ncn/pcn24** and **ssn** parameters are used when the default screening action (**dfltact**) is **forward, duplicate** or **dupdisc** (duplicate and discard). These parameters allow the craftsperson to change the defined node to which the input message will be routed.

:pci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:ri= (optional)

Routing indicator. This parameter specifies whether a subsequent global title translation is required. This parameter can be specified only when the value specified for the **dftact** parameter is **forward**, **duplicate**, or **dupdisc**.

Range: gt, ssn

System

Default: ssn

:ssn= (optional)

Subsystem Number. The **pc/pca/pci/pcn/pcn24** and **ssn** parameters are used when the default screening action (**dftact**) is **forward**, **duplicate** or **dupdisc**. These parameters are used to change the defined node where the input message will be routed.

Range: 002-255 none

Default: none

:tt= (optional)

Translation type. This parameter specifies the value that the CdPA TT is set to as the result of Enhanced GSM Map Screening.

The parameter can be specified only if the value specified for the **dfltact** parameter is **forward**, **duplicate**, or **dupdisc**.

Range: 0-255 none

Default: none

Example

The following example adds a MAP operation code of 71 with a name of ati with a default action of discard:

```
ent-gsms-opcode:opcode=71:opname=ati:dfltact=discard
```

The following example adds a MAP operation code of 71 with a name of ati with a default action of forward, an international point code of 1-1-1, a subsystem number of 5, and forces:

```
ent-gsms-
opcode:opcode=71:opname=ati:dfltact=forward:pci=1-1-1:ssn=5:force=yes
```

The following example adds a MAP operation code of 71 with a name of ati with a default action of duplicate, an international point code of 1-1-1, a subsystem number of 5, and forces:

```
ent-gsms-
opcode:opcode=71:opname=ati:dfltact=duplicate:pci=1-1-1:ssn=5:force=yes
```

The following example adds a MAP operation code of 71 with a name of ati with a default action of dupdisc, an international point code of 1-1-1, a subsystem number of 5, and forces:

```
ent-gsms-
opcode:opcode=71:opname=ati:dfltact=dupdisc:pci=1-1-1:ssn=5:force=yes
```

The following example adds a MAP operation code of * with a name of xyz with a default action of duplicate, an ANSI point code of 8-8-8, a subsystem number of 20:

```
ent-gsms-
opcode:opcode=*:opname=xyz:pca=8-8-8:dfltact=duplicate:ssn=20
```

The following example adds a MAP operation code of 22 with a name of ati with a default action of discard:

```
ent-gsms-opcode:opcode=22:opname=ati:dfltact=discard
```

The following example shows a spare point code:

```
ent-gsms-
opcode:opname=test3:opcode=3:pci=s-1-1-1:dfltact=duplicate:ssn=10:force
```

The following example shows a MAP set value. The Flexible GTT Load Sharing feature is ON.

```
ent-gsms-
opcode:opname=test3:opcode=3:pc=1-1-1:dfltact=duplicate:ssn=10:mapset=7
```

The following example adds a MAP operation code of 27 with a name of test3 with a default action of forward, an ANSI point code of 1-1-2, a subsystem number of 12 and a routing indicator of gt:

```
ent-gsms-
opcode:opname=test3:opcode=27:dfltact=forward:pca=1-1-2:ssn=12:ri=gt
```

The following example shows a translation type value:

```
ent-gsms-
opcode:opname=test4:opcode=32:dfltact=forward:mapset=dflt:pc=1-2-
3:ssn=12:tt=11
```

Dependencies

The GSM Map Screening feature must be turned on before this command can be entered.

If the **dfltact** parameter is specified, then the **pass**, **discard**, **atierr**, **route**, **forward**, **duplicate**, or **dupdisc** value must be assigned.

The reserved word **none** cannot be specified as a value for the **opname** parameter.

The **pc/pca/pci/pcn/pcn24** and **ssn** parameters can be specified only if the **dfltact** parameter is specified and its value is **forward**, **duplicate**, or **dupdisc**.

If the **dfltact** parameter is specified with a value of **forward**, **duplicate**, or **dupdisc**, then a **pc/pca/pci/pcn/pcn24** parameter and the **ssn** parameter must be specified.

The **force** parameter can be specified only if a **pc/pca/pci/pcn/pcn24** parameter and the **ssn** parameter are specified.

The **dfltact=atierr** parameter cannot be specified unless the value of the operation code referenced by the **opname** parameter is **71**. The **atierr** option is valid only for ATI MAP operation codes, and the **opcode=71** parameter signifies an ATI MAP operation code.

The value specified for the **opcode** parameter cannot already exist in the GSM Map Op-Code table.

The value specified for the **opname** parameter cannot already be used in the GSM Map Op-Code table.

If the **pc/pca/pci/pcn/pcn24** parameter and the **ssn** parameter are specified, and the **force** parameter is not specified as **yes**, then the PC-SSN must exist in the SCCP Application entity set (Remote Point Code / Mated Application Table).

The Enhanced GSM Map Screening feature must be enabled and turned on before the **opcode=*** parameter can be specified.

If specified, the **pc/pca/pci/pcn/pcn24** parameter value must be a full point code.

If specified, the **pc/pca/pci/pcn/pcn24** parameter value must exist as a destination in the Ordered Route entity set or reside in a cluster (ANSI only) that exists as a destination in the Ordered Route entity set (for global title routing).

The Enhanced GSM Map Screening feature must be enabled and turned on when the PC/PCA is specified.

If the **mapset**, **ri**, or **tt** parameter is specified, then the value specified for the **dfltact** parameter must be **forward**, **duplicate**, or **dupdisc**.

If the **dfltact** parameter is specified as **forward**, **duplicate**, or **dupdisc**, then the **mapset** parameter must be specified.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

The specified MAP set must exist.

If the **mapset** parameter is not specified as **dflt**, or if the **mapset=dflt** parameter is specified, and the **force** parameter is not specified as **yes**, then the specified PC/SSN must exist in the specified MAP set.

If the **dfltact** parameter has a value of **forward**, **duplicate**, or **dupdisc**, then the value specified for the **pc/pca/pci/pcn/pcn24** parameter cannot be associated with a proxy point code.

If the **ri=ssn** parameter is specified, then the **ssn=none** parameter cannot be specified.

If the Flexible GTT Load Sharing feature is enabled, the **mapset** parameter is specified, and the **ssn** parameter is not specified or has a value of **none**, then the specified MAPSET/PC combination must already exist in the MAP table.

If the Flexible GTT Load Sharing feature is not enabled and the **ssn** parameter is not specified or has a value of **none**, then the specified point code must already exist in the MAP table.

Notes

Origination Addresses are considered to be the SCCP CGPA address as well as the Numbering Plan and Nature of Address values.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Output

```
ent-gsms-

```

ent-gsmssn-scrn

Enter GSM Subsystem Number Screening Entry

Use this command to provision origination and destination SSNs (subsystem numbers) to be screened using the GSM (Global System for Mobile Telecommunication) MAP (mobile application part) screening feature. The value of the **ssn** parameter that is entered with this command is added to the GSM SSN screening table. All the MAP messages with the originating or destination **ssn** entered are screened using the GSM Map screening feature.

Keyword: ent-gsmssn-scrn

Related Commands: dlt-gsmssn-scrn, rtrv-gsmssn-scrn

Command Class: Database Administration

Parameters

:ssn= (mandatory)

Subsystem number.

Range: 000-255

:type= (mandatory)

Subsystem type.

Range: dest, orig

dest— destination SSN

orig— origination SSN

Example

The following example adds an originating subsystem of 10 to the GSM SSN Screening table:

```
ent-gsmssn-scrn: ssn=10: type=orig
```

Dependencies

The GSM Map Screening feature must be turned on before this command can be entered.

A value for the **ssn** and **type** parameter combination cannot be specified that already exists in the GSM SSN screening table.

Notes

None

Output

```
ent-gsmssn-scrn: ssn=10: type=orig
rlghncxa03w 04-01-10 11:43:04 EST EAGLE 31.3.0
ENT-GSMSSN-SCRN: MASP A - COMPLTD
;
```

ent-gta**Enter Global Title Address Information
Command**

Use this command to specify the GTA (global title address) information for applicable global title selectors required to specify a global title entry.

This command adds the routing object (a destination address and a subsystem number) for messages requiring a global title translation. The translation is performed on the basis of the global title address (**gta**), global title indicator (**gti**), numbering plan (**np**), nature of address indicator (**nai**), and translation type (**tt**) of each SS7 SCCP message directed to the STP with a routing indicator of 0, indicating a GTT is required.

NOTE: If the EGTT feature is turned on, the GTT Selector (ent/chg/dlt/rtrv-gttset), GTT Set (ent/dlt/rtrv-gttset), and GTA (ent/chg/dlt/rtrv-gta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is turned on.

Keyword: ent-gta

Related Commands: chg-gta, dlt-gta, rtrv-gta

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

NOTE: As of Release 42.0, the ntt, ngti, nnai, nnp, npdd, npds, nsdd, nsds, and rmggt parameters are obsolete for this command. These parameters will be provisioned using the ent/chg-gtmod commands.

:gttsn= (mandatory)

GTT set name. This parameter specifies the entity to which global title addresses and selectors are assigned.

Range: ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

- :xlat=** (mandatory)
 Translate indicator. This parameter specifies translation actions and routing actions.
Range: **dpc, dpcngt, dpcssn, none**
- :acn=** (optional)
 Application context name. This parameter specifies the ITU TCAP *acn* field in the incoming MSU.
Range: **0-255 *, none**
 The *acn* supports up to 7 subfields separated by dash (e.g., *1-202-33-104-54-26-007*)
 *—any valid value in the ITU TCAP *acn* field in the incoming MSU
none—there is no ITU TCAP *acn* field in the incoming MSU
- :actsn=** (optional)
 GTT Action Set Name.
Range: *aaaaaaaa*
 1 leading alphabetic character and up to 8 following alphanumeric characters
- :ccgt=** (optional)
 Cancel called global title indicator.
Range: **yes, no**
Default: **no**
- :cdselid=** (optional)
 CdPA Selector ID.
Range: **0-65534**
- :cdssn=** (optional)
 Starting CdPA subsystem number.
Range: **0-255**
- :cgcnvsn=** (optional)
 CgPA conversion set name.
Range: *aaaaaaaa*
 1 leading alphabetic character and up to 8 following alphanumeric characters.
- :cggtmod=** (optional)
 Calling party GT modification indicator. This parameter specifies whether calling party global title modification is required.
Range: **yes, no**
Default: **no**
- :cgpc=** (optional)
 ANSI CgPA point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).
Synonym: **cgpca**
Range: **000-255, ***
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
 The asterisk (*) value is not valid for the *ni* subfield.
 When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.
 When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.
 When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.
 When **chg-sid:pctype=ansi** is specified, *ni-*-** is valid if *ni = 006-255*.
 The point code **000-000-000** is not a valid point code.

:cgpci= (optional)

ITU international CgPA point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:cgpcn= (optional)

ITU national CgPA point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:cgpcn24= (optional)

24-bit ITU national CgPA point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:cgselid= (optional)

CgPA Selector ID.

Range: **0-65534**

:cgssn= (optional)

Starting CgPA subsystem number.

Range: **0-255**

:dpc= (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **dpca**

Range: **000-255, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

When **chg-sid:pctype=ansi** is specified, *ni*-*-* is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Point Code.

:dpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000–255**

ssa—**000–255**

sp—**000–255**

:ecdssn= (optional)

Ending CdPA subsystem number.

Range: **0-255**

:ecgssn= (optional)

Ending CgPA subsystem number.

Range: 0-255

:egta= (optional)

End global title address. This parameter specifies the end of a range of global title digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: Same as the specified **gta** value

:fallback= (optional)

Fallback option. This parameter specifies the action taken when the final translation does not match while performing GTT using a FLOBR-specific GTT mode.

Range: **yes, no, sysdflt**

yes — perform GTT based on the last matched entry

no — GTT fails and the MSU is discarded

sysdflt — use the system-wide default fallback option in the SCCPOPTS table

Default: **sysdflt**

:family= (optional)

This parameter specifies the ANSI TCAP *family* field in the incoming MSU.

Range: 0-255 *, **none**

*—any valid value in the ANSI TCAP *family* field in the incoming MSU

none—there is no value in the ANSI TCAP *family* field in the incoming MSU

:force= (optional)

Check mated application override. This parameter must be used to complete command execution if the **pci/pcn** and **ssn** parameter combination specified in the command is not already defined in the SCCP Application entity set (Remote Point Code/Mated Application Table).

Range: **yes, no**

Default: **no**

:gta= (optional)

Global title address. This parameter specifies the beginning of a range of global title digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

:gtmodid= (optional)

Global title modification identifier.

Range: *ayyyyyyy*

1 alphabetic character followed by up to 8 alphanumeric characters

Default: none

:loopset= (optional)

SCCP loopset name. This parameter associates a translation set with a loopset.

Range: *ayyyyyyy*, **none**

1 leading alphabetic character and up to 7 following alphanumeric characters.

none—There is no association between the translation set and any loopset.

Default: **none**

:mapset= (optional)

MAP set ID. This parameter specifies the Mated Application set ID.

Range: **1-36000 dflt**
 dflt—Default MAP set

:mrnset= (optional)

MRN set ID. This parameter specifies the Mated Relay Node set ID.

Range: **1-3000 none, dflt**
 dflt—Default MRN set.
 none—The GTA translation does not participate in any load sharing.

:opc= (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **opca**

Range: **000-255, ***
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
 The asterisk (*) value is not valid for the *ni* subfield.
 When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.
 When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.
 When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.
 When **chg-sid:pctype=ansi** is specified, *ni*-*-*** is valid if *ni* = **006-255**.
 The point code **000-000-000** is not a valid point code.

:opc/opca/opci/opcn/open24= (optional)

Originating Point Code

:opci= (optional)

ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—**s-**
zone—**0-7**
area—**000-255**
id—**0-7**
 The point code **0-000-0** is not a valid point code.

:open= (optional)

ITU originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:opc24= (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:opcode= (optional)

This parameter specifies the TCAP *opcode* field in the incoming MSU.

Range: **0-255** *, **none**

*—any valid value in the TCAP *opcode* field in the incoming MSU

none—there is no value in the TCAP *opcode* field in the incoming MSU

:opcsn= (optional)

The OPC GTT set name.

Range: *ayyyyyyy*

1 leading alphabetic character and up to 8 following alphanumeric characters.

:optsn= (optional)

Optional gtt set name.

Range: *ayyyyyyy*

1 leading alphabetic character and up to 8 following alphanumeric characters.

:pc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **pca**

Range: **p-**, **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (optional)

Point code.

:pci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-**, **p-**, **ps-**, **0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**
zone—**0-7**
area—**000-255**
id—**0-7**

The point code **0-000-0** is not a valid point code.

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**
nnnnn—**0-16383**
gc—**aa-zz**
m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)* The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**
msa—**000-255**
ssa—**000-255**
sp—**000-255**

:pkgtype= (optional)

This parameter specifies the ANSI and ITU TCAP package type.

Range: **ituuni, qwp, qwop, resp, cwp, cwop, any, bgn, end, cnt, ituabort, ansiabort, ansiuni**

ituuni — ITU unidirectional
qwp — Query with Permission
qwop — Query without Permission
resp — Response
cwp — Conversation with Permission
cwop — Conversation without Permission
any — Wildcard value
bgn — Begin
end — End
cnt — Continue
ituabort — ITU abort
ansiabort — ANSI abort
ansiuni — ANSI unidirectional
 ANSI TCAP Package Types—**ansiuni, qwp, qwop, resp, cwp, cwop, ansiabort, any**
 ITU TCAP Package Types—**bgn, ituabort, ituuni, any, end, cnt**

:ppmeasreqd= (optional)

This parameter specifies whether Per Path measurements are required.

Range: **yes, no**

yes — per path measurements are required

no — per path measurements are not required

Default: No change to the current value

:ri= (optional)

Routing indicator.

Range: **gt, ssn**

gt — Allow a called party address with a routing indicator value of “global title.”

ssn — Allow a called party address with a routing indicator value of “DPC/SSN.”

:ssn= (optional)

New translated subsystem number.

Range: **002-255**

Default: No **ssn** value provided

:testmode= (optional)

This parameter is used to invoke a field-safe Test Tool in order to debug the FLOBR/TOBR rules.

CAUTION: If the testmode=on parameter is specified, then the rule is used only by test messages. The rule is ignored by 'live' traffic. If the testmode=off parameter is specified, then both test and live messages use the rule. Changing from testmode=off to testmode=on is equivalent to deleting the rule for live traffic.

Range: **on, off**

on — Process the translation rules defined in the test message

off — Perform standard GTT behavior

Default: **off**

:ngti= (obsolete)

New GTI code. When the ANSI/ITU SCCP Conversion and AMGTT features are ON, and the Translated Point Code is of a different network type, this parameter specifies whether the new GTI translation format is GTI type **2** or GTI type **4**.

Range: **2, 4**

:nnai= (obsolete)

New nature of address indicator. This parameter specifies the nature of address indicator that will replace the received nature of address indicator.

Range: **0-127**

Default: **0xFFFF**

:nnp= (obsolete)

New numbering plan. This parameter specifies the numbering plan that will replace the received numbering plan.

Range: **0-15**

Default: **0xFFFF**

:npdd= (obsolete)

New prefix digits to be deleted. This parameter specifies the new prefix digits to be deleted that will replace the received prefix digits to be deleted.

Range: **0-21**

Default: **0**

:npds= (obsolete)

New prefix digits string. This parameter specifies the new prefix digits string that will replace the received prefix digits string.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: No digits

:nsdd= (obsolete)

New suffix digits to be deleted. This parameter specifies the new suffix digits to be deleted that will replace the received suffix digits to be deleted.

Range: **0-21**

Default: **0**

:nsds= (obsolete)

New suffix digits string. This parameter specifies the new suffix digits string that will replace the received suffix digits string.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: No digits

:ntt= (obsolete)

New translation type. The point code domain translation types for EGTT are handled by the EAGLE 5 ISS protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I Spare, ITU-N, and ITU-N Spare. ITU-I includes ITU-I Spare, and ITU-N includes ITU-N Spare.

Range: **000-255**

Default: No **ntt** value provided

```

Dependencies

The EGTT feature must be turned on before this command can be entered.

The ANSI/ITU SCCP Conversion feature must be enabled before a translated PC that is of a different domain than the GTT set specified by the **gttsn** parameter can be specified.

The ANSI/ITU SCCP Conversion feature must be enabled before a translated PC and a translation type in different network types can be specified.

The **gttsn** parameter must be specified and must match an existing **gttsn**.

The **pc/pca/pci/pcn/pcn24** parameter cannot be out of range.

If the **egta** parameter is specified, then the values of the **gta** and **egta** parameters must be the same length.

The length of the specified **gta** parameter must match the number of digits provisioned for the specified GTT set (**gttsn**) when VGTT is OFF. If the VGTT (variable length GTT) feature is turned on, then up to 10 GTA lengths can exist per GTT set. If the Support for 16 GTT Lengths in VGTT feature is turned on, then up to 16 GTA lengths can exist per GTT set.

The specified **gta/egta** range must exist for the specified GTT set in the STP active database. While an exact match is not required, you cannot specify an overlap with another range. If the range overlaps, an error is generated that displays a list of overlapped global title addresses. An example follows that shows what happens when the user attempts to enter a global title address range (such as 8005550000 to 8005559999) that overlaps an existing range. The overlapping links must match. If they do not, the error message displays the list of overlapped global title addresses:

```
The following GTA ranges overlap the input GTA range
START GTA          END GTA
8005550000         8005551999
8005552000         8005553999
8005554000         8005555999
ENT-GTA: MASP A - Command Aborted
```

If the translated point code is of type ANSI, the **ngti** parameter of the referred GTMOD cannot be **4**. For ANSI PCs, the **ngti** value must be **2**.

If the new or existing **pc/pca/pci/pcn/pcn24** parameter is the STP point code or capability point code, then the **ccgt=no** parameter must be specified.

If the **xlat=dpcngt** parameter is specified, then the **ri=gt** parameter must be specified.

If the **ssn** parameter is specified, then the **xlat=dpcssn** parameter must be specified.

If the **xlat=dpcssn** parameter is specified, then the **ssn** parameter must be specified.

If the value specified for the **pc/pca/pci/pcn/pcn24** parameter is the STP's true point code, the **xlat=dpcssn** and **ri=ssn** parameters must be specified.

If the value specified for the **pc/pca/pci/pcn/pcn24** parameter is the STP's true point code and the **ssn** parameter is specified, the **ssn** parameter must exist in the SS-APPL table.

Unless the PC is the STP true PC, the value specified for the **pc/pca/pci/pcn/pcn24** parameter must exist as a destination in the Route table or reside in a cluster that exists as a destination in the Route table (for global routing).

If a final GTT (the **ri=ssn** parameter) is specified with the **xlat=dpc** parameter and without the **force=yes** parameter, then the PC (**pc/pca/pci/pcn/pcn24**) must exist in the Remote Point Code/ MAP table. The **force=yes** parameter can be specified to execute the command when the PC is not in the table; the following warning message is displayed in the scroll area of the terminal:

CAUTION: DPC DOES NOT EXIST IN MATED APPLICATION TABLE.

If the **ccgt=yes** parameter is specified, then the **ri=ssn** parameter must be specified.

If the **pc/pca/pci/pcn/pcn24** parameter is any of the STP's PCs or CPCs, then the **ccgt=no** parameter must be specified.

If the XGTT feature is enabled, the GTT table can contain up to either 400,000 or 1,000,000 entries, depending on the controlled feature Part Number that is enabled. If XGTT is not enabled, the GTT table can contain up to 269,999 user entries. An error message is displayed if a command entry would result in more than the allowed maximum number of entries in the table.

If the **egta** parameter is specified, then the value of the **egta** parameter must be greater than or equal to the value of the **gta** parameter.

The GTT Set Name must not be **none**.

The **pc/pca/pci/pcn/pcn24** parameter must be a full PC.

If the VGTT feature is turned on, then up to 10 GTA lengths can exist per GTT set. If the Support for 16 GTT Lengths in VGTT feature is turned on, then up to 16 GTA lengths can exist per GTT set.

If the **ri=ssn** parameter is specified, then the **mrnset** parameter must not be specified.

If the Flexible GTT Load Sharing feature is enabled, then the specified PC must already exist in the specified MRN set.

The specified MRN set must already exist in the MRN table.

The **mrnset** parameter can only be specified when the Flexible GTT Load-Sharing feature is enabled.

If the **ri=gt** parameter is specified, then the **mrnset** parameter must be specified.

The **mapset** parameter can only be specified if the Flexible GTT Load Sharing feature is enabled, and the **ri=ssn** parameter is specified. If the **ri=ssn** parameter is specified, the **mapset** parameter must be specified. If the **ri=gt** parameter is specified, the **mapset** parameter cannot be specified.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

The specified PC and SSN must exist in the specified MAP set.

The specified MAP set must exist in the database.

If the **xlat=dpc** parameter is specified, and the **force** parameter is not specified as **yes**, then the specified PC and MAP set must exist in the MAP table.

The **gta**, **cgpc/cgpc/cgpci/cgpcn/cgpcn24**, **opc/opca/opci/opcn/opcn24**, **cgssn**, **cdssn**, **opcode/acn/pkgtype**, **opcode/family/pkgtype**, or **dpc/dpca/dpci/dpcn/dpcn24** parameter must be specified.

The **cdselid**, **cgselid**, and **optsn** parameters cannot be specified together in the command. If the GTT set has a set type of **cdgta**, **cdssn**, or **opcode**, then the **opcsn** parameter can be specified with one of the above parameters.

If the **cgssn** parameter is specified, then the **optsn** and **cgselid** parameters cannot be specified.

The value specified for the **ecgssn** or **ecdssn** parameter must be greater than the value specified for the **cgssn** or **cdssn** parameter.

The OBSR feature must be enabled before the **opcsn**, **optsn**, **cgpc/cgpc/cgpci/cgpcn/cgpcn24**, **opc/opca/opci/opcn/opcn24**, or **(e)cgssn** parameters can be specified.

If the GTT set specified by the **gttsn** parameter (GTTSN set) has a set type of **cdgta** (see the **ent-gttset** command), then the **optsn** parameter cannot specify a GTT set (OPTSN set) with a set type of **cgssn**. If the GTTSN set has a set type of **cdgta**, then the OPTSN set must have a set type of **cggtta** or **cgpc**. The FLOBR feature must be turned on before a GTTSN set with a set type of **cgpc**, **cggtta**, or **opc** can be specified with an OPTSN with a set type other than **cgssn**. If the FLOBR feature is turned on, and the GTTSN set has a set type of **cdgta** or **cdssn**, then the OPTSN set cannot have a set type of **opc**. If the TOBR feature is turned on, and the GTTSN set has a set type of **opcode**, then the OPTSN set cannot have a set type of **opc**.

The GTA must be specified if the GTTSN set type has a value of **cdgta** or **cggtta**. The GTA cannot be specified for other set types.

If the GTTSN set type has a value of **cgpc**, the **cgpc/cgpcac/cgpci/cgpcn/cgpcn24** parameter must be specified. This parameter cannot be specified for other set types.

The **opc**, **opca**, **opci**, **opcn**, or **opcn24** parameter must be specified if the GTTSN set type has a value of **opc**. These parameters cannot be specified for other set types.

If the GTTSN set type has a value of **cgssn**, the **cgssn** parameter must be specified. The **cgssn** parameter cannot be specified for GTTSN of other types.

The range specified by the **cdssn/ecdssn** and **cgssn/ecgssn** parameters cannot overlap a currently existing range for the specified GTT set.

The GTT set name specified by the **opcsn** parameter must have a set type of **opc** (see the **ent-gttset** command).

The OPC subsystem number set domain must be the same as the GTTSN set domain. If the GTT subsystem number set domain is ANSI, then the OPC subsystem number set domain must be ANSI. If the GTT subsystem number set domain is ITU, then the OPC subsystem number set domain must be ITU.

The translation entry specified by the **cgpc**, **opcode**, **opc**, or **dpc** parameters cannot already exist.

The **cgpc**, **cgssn**, **gta**, **opc**, **cdssn**, and **opcode** parameters cannot be specified together in the command. If the **cgssn** and **cdssn** parameters are both specified in the same command (in any order), then only the value for the last of the two parameters specified is used during processing.

The Hex Digit Support for GTT feature must be turned on before hexadecimal digits can be specified for the **gta** or **egta** parameter.

The value of the **loopset** parameter must already exist in the database.

The SCCP Loop Detection feature must be enabled before the **loopset** parameter can be specified.

The value specified for the **pc** parameter cannot be associated with a proxy point code.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the **cggtmod** parameter can be specified.

The FLOBR feature must be turned on before the **fallback**, **cdselid**, **cdssn**, **ecdssn**, or **dpc** parameter can be specified.

The FLOBR feature must be turned on before the **gttsn** parameter can specify a GTT set with a set type other than **cdgta** (see the **ent-gttset** command) in the same command with the **cgselid** parameter.

The OBSR feature must be enabled or the FLOBR feature must be turned on before the **cgselid** parameter can be specified.

The ANSI/ITU SCCP Conversion feature must be enabled before the GTT set specified by the **optsn** parameter can have a different domain than the GTT set specified by the **gttsn** parameter.

A TOBR quantity feature must be turned on before the **opcode**, **pkgtype**, **acn**, or **family** parameter can be specified.

The **opcode**, **pkgtype**, and **family** parameters must be specified together for ANSI TCAP translations. The **opcode**, **pkgtype**, and **acn** parameters must be specified together for ITU TCAP translations.

If the GTT set specified by the **gttsn** parameter has a set type of **opcode** (see the **ent-gttset** command), then the **opcode/acn/pkgtype** or **opcode/family/pkgtype** parameter must be specified. These parameters cannot be specified for GTT sets of any other set types.

If the GTT set specified by the **gttsn** parameter has a set type of **cdssn** (see the **ent-gttset** command), then the **cdssn** parameter must be specified. This parameter cannot be specified for GTT sets with other set types.

The maximum number of OPCODE translation entries cannot exceed the value that is set by the associated TOBR quantity feature.

The GTT set specified by the **gttsn** parameter must have a set type of **cdgta**, **opcode**, or **cdssn** (see the **ent-gttset** command) before the **opcsn** parameter can be specified.

The same value cannot be specified for the **gttsn** and **optsn** parameters.

The ANSI/ITU SCCP conversion feature must be enabled and the FLOBR feature must be turned on before the **cgcnvsn** parameter can be specified.

The GTT set specified by the **gttsn** parameter must have a set type of **cdgta** or **cggta** (see the **ent-gttset** command) before the **cgcnvsn** parameter can be specified.

If the **cgssn** parameter is specified, then the **ecdssn** parameter cannot be specified. If the **cdssn** parameter is specified, then the **ecgssn** parameter cannot be specified.

The GTT set specified by the **gttsn** parameter cannot be the same as the GTT set specified by the **cgcnvsn** parameter.

If the **family** parameter is specified, then a value of **ansiuni**, **qwp**, **qwop**, **resp**, **cwp**, **cwop**, **ansiabort**, or **any** must be specified for the **pkgtype** parameter.

If the **acn** parameter is specified, then a value of **bgn**, **ituabort**, **ituuni**, **any**, **end**, or **ent** must be specified for the **pkgtype** parameter.

The GTT set specified by the **optsn**, **opcsn**, and **cgcnvsn** parameters must match an existing GTT set.

If the **pkgtype=ituabort**, then a value of **none** must be specified for the **acn** and **opcode** parameters. If the **pkgtype=ansiabort** is specified then a value of **none** must be specified for the **family** and **opcode** parameters.

If the **family** and **opcode** parameters are specified in the command, then either both parameters must have a value of **none** or neither parameter can have a value of **none**.

One or more point codes in the command will exceed the maximum number of entries in the MAP table.

The OBSR feature must be enabled or the FLOBR feature must be turned on before the **optsn** parameter can be specified.

The specified GTT Action Set must already exist in the database.

The **actsn=none** parameter cannot be specified.

The **dpc/dpca/dpci/dpcn/dpcn24** parameter must be specified if the GTTSN set type is **dpc** (see the **ent-gttset** command). If the GTT set has a set type other than **dpc**, then the **dpc/dpca/dpci/dpcn/dpcn24** parameter cannot be specified.

If the **xlat=none** parameter is specified, then the **ri**, **pc/pca/pci/pcn/pcn24**, **force**, **ssn** and **ccgt** parameters cannot be specified.

The value specified for the **gtmodid** parameter must already exist in the GTMOD table.

The **gtmodid=none** parameter cannot be specified.

If the FGTTLS feature is enabled, and the **xlat=none** parameter is specified, then the **mrnset** or **mapset** parameter must be specified.

The specified GTT set must have a set type of **opcode** (see the **ent-gttset** command) before the **opcode/acn/pkgtype** or **opcode/family/pkgtype** parameters can be specified. The specified GTT set must have a set type of **cdssn**, **cgssn**, **cdgta/cgta**, **opc**, or **cgpc** before the **cdssn**, **cgssn**, **gta**, **opc**, or **cgpc** parameter, respectively, can be specified.

The **acn** and **family** parameters cannot be specified together in the command.

If the **opc** or **dpc** parameter is specified, then the **(e)gta**, **(e)cgssn**, **(e)cdssn**, and **opcode** parameters cannot be specified.

Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

When the Flexible GTT Load Sharing feature and the Intermediate GTT Load Sharing feature are on, multiple relationships can be defined among set of destination point codes in the MRN table, which already exists in the EAGLE 5 ISS. The relationship used in a particular translation is based on the GTA digits used for translation. The MRN set and the post-translation PC create a key that is used to perform lookups in the MRN table. The lookup results in a set of alternate PCs, one of which is selected, based on PC relative cost, to route the MSU in the most cost effective way.

When the Flexible GTT Load Sharing feature is enabled, multiple relationships can be defined among a set of PC/SSNs in the existing MAP table. The relationship used in a particular translation is based on the GTA digits used for translation.

When the Origin-based SCCP Routing feature is turned on, the CdPA GTA, CgPA GTA, CgPA PC, CgPA SSN, and OPC entries can be provisioned. When provisioning, the following rules apply:

- The Advanced CdPA GTA entry can associate with CgPA GTA set, CgPA PC set, or SELID and OPC set.
- The CgPA GTA, CgPA PC, or OPC entry can associate with the CgPA SSN set.
- The CgPA SSN entry cannot associate with any other GTT set.
- The Advanced CdPA GTA entry may contain SELID, which is (together with the CgPA information) derived from incoming MSU to search the Selector table again for the CgPA GTA or CgPA PC Set.

When the Origin-based SCCP Routing feature is enabled, the GTA and EGTA can be used for the CgPA translation as well as the CdPA GTA translation.

A loopset consists of a set of point codes that form a routing loop in the network. If the SCCP Loop Detection feature is enabled, then the loopset can be associated with or disassociated from specified translation entries. Loopsets that are associated with translation entries are checked during intermediate and final GTT traffic routing. If a loop exists, then the system can be notified with or without discarding the associated traffic.

The maximum length of the resulting GTA string must not exceed 21 digits when translation is complete.

If the FLOBR GTT hierarchy is provisioned on a linkset, then translations do not have to be searched in a predetermined manner. If a translation points to another GTTSET/SELID, then database searches continue. The number of searches is limited by the following conditions:

- The same GTT set name cannot be referred more than once.
- Up to 7 database searches can be performed.

If the FLOBR feature is turned on, then any translation can point to any GTTSETs other than that specified by the GTTSN. The CdPA GTA and CdPA SSN translations can also point to an OPCS. For CdPA GTA and CdPA SSN translations, if an OPTSN GTTSET/SELID is provisioned apart from an OPCS, then the OPTSN GTTSET/SELID takes precedence over the OPCS.

Translations, supporting ANSI or ITU opcodes, associated with the TOBR feature:

- ANSI Opcode—ANSI opcode specifier, ANSI TCAP Package type, and Family
- ITU Opcode—ITU opcode, ITU TCAP Package Type, and ACN

Translations associated with the FLOBR feature:

- CdPA SSN Translations—Can be configured with routing and flexible routing data. The provisioning rules for CdPA SSN translations are the same as CgPA SSN translations in OBSR.
- DPC Translations—The provisioning rules for DPC translations are the same as OPC translations except that OPCS parameter can not be configured for DPC translations.

ent-gtcnv

Enter Global Title Conversion

Use this command to provision the Default Global Title Conversion table. The table is used during conversion for MTP-routed cross network SCCP UDT(S), XUDT(S) and SCCP Management messages. It is also used during conversion for GT routed messages when a matching entry exists in the Global Title address table but the NGTI value is not provisioned.

Keyword: ent-gtcnv

Related Commands: chg-gtcnv, dlt-gtcnv, rtrv-gtcnv

Command Class: Database Administration

Parameters

:dir= (mandatory)

Direction of conversion.

Range: atoi, itoa, both

atoi— ANSI to ITU conversion

itoa— ITU to ANSI conversion

both— conversion in both directions

:gtixlat= (mandatory)

Global Title Indicator conversion. This parameter is expressed in the form of the ANSI GTI and the ITU GTI.

Range: 22, 24

22— Converts an incoming ANSI GTI 2 to an outgoing ITU GTI 2 or an incoming ITU GTI 2 to an outgoing ANSI GTI 2

24— Converts an incoming ANSI GTI 2 to an outgoing ITU GTI 4 or an incoming ITU GTI 4 to an outgoing ANSI GTI 2

:tta= (mandatory)

ANSI translation type.

Range: 0-255 *

:tti= (mandatory)

ITU translation type.

Range: 0-255 *

:nai= (optional)

Nature of address indicator. This parameter is mandatory when **gtixlat=24** is specified, and not specified when **gtixlat=22** is specified.

Range: 0-63 *

Default: Not set

:np= (optional)

Numbering plan. This parameter is mandatory when **gtixlat=24** is specified, and not specified when **gtixlat=22** is specified.

Range: 0-15 *

Default: Not set

:npdd= (optional)

New prefix digits to be deleted. This parameter specifies the number of new prefix digits to be deleted. These digits will be replaced with the new prefix digits string (**npds**).

Range: 0-21

Default: 0

:npds= (optional)

New prefix digits string. This parameter specifies the new prefix digits string that will replace the received prefix digits string.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: No digits

:nsdd= (optional)

New suffix digits to be deleted. This parameter identifies the new suffix digits to be deleted that will replace the received suffix digits to be deleted.

Range: 0-21

Default: 0

:nsds= (optional)

New suffix digits string. This parameter specifies the new suffix digits string that will replace the received suffix digits string.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: No digits

Example

The following example assigns an entry used for ANSI to ITU conversion where the conversion is from GTI 2 to GTI 2.

```
ent-gtcnv:dir=atoi:gtixlat=22:tta=10:tti=5
```

The following example assigns an entry used for ANSI to ITU conversion where the conversion is from GTI 2 to GTI 4. The nsdd parameter specifies that the last 3 digits are to be removed from the end of the address digits, and the nsds parameter specifies that the digits 123 are to be appended to the end of the remaining address digits.

```
ent-
```

```
gtcnv:dir=atoi:gtixlat=24:tta=11:tti=7:nai=8:np=6:nsdd=3:nsds=123
```

The following example assigns an entry used for ITU to ANSI conversion where the conversion is from GTI 2 to GTI 2. The npdd parameter specifies that the first 3 digits are to be deleted from the beginning of the address digits, and the npds parameter specifies that the digits 407 should be appended to the beginning of the remaining address digits.

```
ent-gtcnv:dir=ittoa:gtixlat=22:tta=11:tti=7:npdd=3:npds=407
```

The following example assigns an entry used for ITU to ANSI conversion where the conversion is from GTI 2 to GTI 4. The nsds Parameter specifies that the digits 45667 are to be appended to the end of the address digits.

```
ent-gtcnv:dir=ittoa:gtixlat=24:tta=11:tti=7:nai=8:np=6:nsds=45667
```

The following example assigns an entry used for ANSI/ITU conversion in both directions where the conversion is from GTI 2 to GTI 2.

```
ent-gtcnv:dir=both:gtixlat=22:tta=11:tti=7
```

The following example assigns an entry used for ANSI/ITU conversion where an incoming ANSI GTI 2 is converted to an outgoing ITU GTI 4 or an incoming ITU GTI 4 to an outgoing ANSI GTI 2.

```
ent-gtcnv:dir=both:gtixlat=24:tta=12:tti=9:nai=6:np=4
```

The following example assigns a default entry for ANSI to ITU conversion where the conversion is from GTI 2 to GTI 2.

```
ent-gtcnv:dir=atoi:gtixlat=24:tta=*:tti=4:nai=6:np=5
```

The following example assigns a default entry for ITU to ANSI where the conversion is from GTI 2 to GTI 4. The npds parameter specifies that the digits 919 are to be appended to the beginning of the address digits.

```
ent-gtcnv:dir=ittoa:gtixlat=24:tta=17:tti=*:nai=*:np=*:npds=919
```

The following example specifies hexadecimal digits for the npds parameter.

```
ent-
```

```
gtcnv:dir=atoi:gtixlat=22:tta=*:tti=4:npdd=3:npds=abcdef0123456789
```

The following example assigns a default entry for ITU to ANSI where the conversion is from GTI 2 to GTI 4. The npds parameter specifies that the digits 123 are to be appended to the beginning of the address digits and the nsds parameter specifies that the digits 407 are to be appended to the end of the address digits

```
ent-
```

```
gtcnv:dir=ittoa:gtixlat=24:tta=17:tti=*:nai=*:np=*:npds=123:nsds=407
```

Dependencies

The ANSI/ITU SCCP Conversion feature must be enabled before this command can be entered.

If the **gtixlat=22** parameter is specified, then the **nai** and **np** parameters cannot be specified.

If the **gtixlat=24** parameter is specified, then the **nai** and **np** parameters must be specified.

If the **dir=both** parameter is specified, then a wildcard value (*) cannot be specified for any of the other parameters.

If the **dir=atoi** parameter is specified, then a wildcard value (*) can be specified only for the **tta** parameter.

If the **dir=itoa** parameter is specified, then a wildcard value (*) must be specified for the **tti**, **np**, and **nai** parameters.

The specified **dir**, **tta**, **tti**, **np**, and **nai** parameter combination cannot already exist in the database.

The **nsdd/nsds** and **npdd/npds** parameters cannot be specified together in the command.

The Default Global Title Conversion table can contain a maximum of 1000 entries.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the **npds** and **nsds** parameters.

Notes

The use of asterisks (wildcards) is allowed only once for each direction of ANSI to ITU and ITU to ANSI. This provides a configurable default.

In the conversion direction of ANSI to ITU, an asterisk can be specified only for the ANSI **tta** parameter.

In the conversion direction of ITU to ANSI, the asterisk value must be specified for the **itu tti**, **np**, and **nai** parameters.

Asterisks are not allowed when conversion is in both directions (**dir=both**).

The suffix digit manipulation parameters **nsdd** and **nsds** cannot be specified in the same command with the prefix digit manipulation parameters **npdd** and **npds** parameters. The **npdd** and **nsdd** parameters specify how many digits to delete, if any, from the beginning or end respectively of the Global Title address digits. The **npds** and **nsds** parameters specify what digits, if any, to append to the beginning or end respectively of the Global Title address digits.

The **gtixlat** parameter is expressed in the form of the ANSI GTI and the ITU GTI. The **gtixlat** parameter is used to indicate the conversion of the Global Title Indicator between the ANSI and ITU standards. For example: A **gtixlat** value of **24** converts an incoming ANSI GTI 2 to an outgoing ITU GTI 4 or an incoming ITU GTI 4 to an outgoing ANSI GTI 2.

Output

```
ent-gtcnv:dir=atoi:gtixlat=22:tta=10:tti=5
  rlgncxa03w 04-01-07 11:43:07 EST EAGLE 31.3.0
  ENT-GTCNV: MASP A - COMPLTD
;
```

ent-gtmod

Enter GT Modification Data

Use this command to enter GT Modification (GTMOD) data in the GTMOD table. The GTMOD entry consists of a GTMOD ID and GTMOD specific data. After the GTMOD ID is provisioned, it can be used in GTT and GTT Action commands.

Keyword: ent-gtmod

Related Commands: chg-gtmod, dlt-gtmod, rtrv-gtmod

Command Class: Database Administration

Parameters

NOTE: Definitions for the feature options specified by the on and off parameters are located in the Notes section.

:gtmodid= (mandatory)

GTMOD identifier.

Range: *ayyyyyyyy*

1 leading alphabetic character followed by up to 8 alphanumeric characters

:cgpassn= (optional)

Calling party subsystem number. This parameter specifies the calling party subsystem address that receives the message.

Range: **002-255**

:ngti= (optional)

New global title indicator. This parameter specifies whether a new GTI translation format is type 2 or type 4.

Range: **2, 4**

:nnai= (optional)

New nature of address indicator. This parameter specifies the value that replaces the received NNAI.

Range: **0-127**

:nnp= (optional)

New numbering plan. This parameter specifies the value that is used to replace the received numbering plan.

Range: **0-15**

:npdd= (optional)

Number of prefix digits to be deleted. This parameter specifies the number of digits to be deleted from the prefix of the received GT address.

Range: **1-21**

:npds= (optional)

New prefix digits string. This parameter specifies the digits to be prefixed to the received GT address.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

:nsdd= (optional)

Number of suffix digits to be deleted. This parameter specifies the number of digits to be deleted from the suffix of the received GT address.

Range: **1-21**

:nsds= (optional)

New suffix digits string. This parameter specifies the digits to be suffixed to the received GT address.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

:ntt= (optional)

New Translation type. This parameter specifies the value that replaces the received Translation Type.

Range: 0-255

:off= (optional)

Disables or turns off the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned off. Up to 8 feature options can be specified in the list.

Range: gt0fill

:on= (optional)

Enables or turns on the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned on. Up to 8 feature options can be specified in the list.

Range: gt0fill

:precd= (optional)

Precedence. This parameter specifies whether the prefix or suffix takes precedence while modifying the received GT address.

Range: pfx, sfx

pfx — if the **npdd** and **npds** parameters are specified

sfx — if the **nsdd** and **nsds** parameters are specified

Example

```
ent-gtmod:gtmodid=set1:npdd=5:npds=123:off=gt0fill:ntt=10
```

```
ent-
```

```
gtmod:gtmodid=gtmodset4:npdd=5:npds=123:nsdd=2:nsds=1234:ngti=4:on=gt0fill:nnai=12:nnp=5:precd=sfx
```

```
ent-gtmod:gtmodid=setntt:ntt=12
```

Dependencies

If the **ngti=4** parameter is specified, then the **nnp** and **nnai** parameters must be specified.

If the **ngti=2** parameter is specified, the **nnp** and **nnai** parameters cannot be specified.

The ANSI/ITU SCCP Conversion feature must be enabled before the **ngti** parameter can be specified.

The Hex Digit Support for GTT feature must be turned on before hexadecimal digits can be specified for the **npds** or **nsds** parameters.

The GTMOD table cannot contain more than 100000 entries.

At least one optional parameter must be specified.

The AMGTT, AMGTT CdPA Only, or AMGTT CgPA Upgrade feature must be turned on before any parameter except the **ntt** parameter can be specified.

The value specified for the **gtmodid** parameter cannot already exist in the GTMOD table.

The combined digit length of the values specified for the **npds** and **nsds** parameters cannot be greater than 21.

If the **npdd/npds** and **nsdd/nsds** parameters are specified, then the **precd** parameter must be specified.

The **gtmodid=none** parameter cannot be specified.

If the **precd** parameter is specified, then the **npdd**, **npds**, **nsdd**, or **nsds** parameter must be specified.

If the **on=gt0fill** parameter is specified, then the **ngti** parameter must be specified.

The same value cannot be specified for the **on** and **off** parameters.

Notes*on/off options*

- **gt0fill**—GT zero fill. Specifies whether the last 0 of the GTA is treated as a valid digit (OFF) or as filler (ON) during GT Modification for the gti(x)=2 to gti(x)=4 scenario.

Output

```
ent-gtmod:gtmodid=set5:ngti=4:nnp=4:nnai=2:on=gt0fill
tekelecstp 10-03-08 14:43:31 EST EAGLE 42.0.0

GTMOD table is (2 of 50000) 1% full

ENT-GTMOD: MASP A - COMPLTD
;
```

ent-gtt**Enter Global Title Translation**

Use this command to add the routing object, DPC, and subsystem number for messages requiring global title translation. The translation is performed on the basis of the global title address (GTA) and translation type (TT) for each SS7 SCCP message directed to the STP's self-identity DPC or CPC with a routing indicator of 0, indicating a GTT is required.

NOTE: If the EGTT feature is turned on, then the GTT Selector (ent/chg/dlt/rtrv-gttset), GTT Set (ent/dlt/rtrv-gttset), and GTA (ent/chg/dlt/rtrv-gta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is on.

Keyword: ent-gtt

Related Commands: chg-gtt, dlt-gtt, rtrv-gtt

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

NOTE: As of Release 42.0, the ntt, ngti, nnai, nnp, npdd, npds, nsdd, nsds, and rmgtt parameters are obsolete for this command. These parameters will be provisioned using the ent/chg-gtmod commands.

:gta= (mandatory)

Global title address. This parameter specifies the beginning of a range of global title digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

:pc= (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: pca

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (mandatory)

Point code.

:pci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:ri= (mandatory)

Route indicator. This parameter specifies whether a subsequent global title translation is required.

Range: **gt, ssn**
gt— Subsequent translation is required.
ssn— Subsequent translation is not required.

:xlat= (mandatory)

Translate indicator. This parameter specifies the type of global title translation to be performed.

Range: **dpc, dpcssn, dpcngt**

:cggtmod= (optional)

Calling party GT modification indicator. This parameter specifies whether calling party global title modification is required.

Range: **yes, no**

Default: **no**

:egta= (optional)

Global title end address. This parameter specifies the end of a range of global title digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: **egta** same as **gta**

:force= (optional)

When a final GTT is specified, the DPC and subsystem number must be configured in the mated application table (**xlat=dpc** and **ri=ssn**). The **force=yes** parameter allows you to override this restriction.

Range: **yes, no**

Default: **no**

:gtmodid= (optional)

Global title modification identifier.

Range: *ayyyyyyy*

1 leading alphabetic character followed by up to 8 alphanumeric characters

Default: none

:loopset= (optional)

SCCP loopset name. This parameter associates a translation set with a loopset.

Range: *ayyyyyyy*, **none**

1 alphabetic character followed by up to 7 alphanumeric characters.

none—There is no association between the translation set and any loopset.

Default: **none**

:mapset= (optional)

MAP set ID.

Range: **1-36000 dflt**

dflt—Default MAP set

:mrnset= (optional)

MRN set ID.

Range: **1-3000 none, dflt**

dflt—Default MRN Set ID

none—Removes the specified MRN Set ID from the MRN table

:ssn= (optional)

Subsystem number. This parameter specifies the subsystem address that will receive the message. If the **xlat=dpcssn** parameter is specified, the **ssn** parameter must be specified. If the **xlat=dpcssn** parameter is not specified, the **ssn** parameter cannot be specified.

Range: 002-255

:ttn= (optional)

Translation type name. The name is of local significance only, and is related to the translation type.

Range: ayyyyyyy

1 alphabetic character followed by up to 8 alphanumeric characters

Default: No translation name is given

:type/typea/typei/typen/typen24/typeis/typens= (optional)

Translation type. This parameter identifies the translation type and network type. This parameter is the decimal representation of the 1-byte field used in SS7.

The **type** and **typea** parameters specify an ANSI network.

The **typei** parameter specifies an ITU-international network.

The **typen** parameter specifies an ITU-national network.

The **typen24** parameter specifies a 24-bit ITU-national network.

The **typeis** parameter specifies an ITU-international spare network.

The **typens** parameter specifies an ITU-national spare network.

A translation type numeric value may be entered as ANSI type (**type** or **typea**) and as an ITU type (**typei/typen/typen24/typeis/typens**). However, they are separate entities.

The point code domain translation types for GTT are handled by the EAGLE 5 ISS protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I spare, ITU-N, ITU-N spare, and ITU-N24.

Range: 000-255

Default: No translation type is specified

:ngt= (obsolete)

New global title. This parameter specifies the type of global title translation that will replace the received global title.

If the **xlat=dpngt** parameter is specified, the **ngt** parameter must be specified. If the **xlat=dpngt** parameter is not specified, the **ngt** parameter cannot be specified.

Range: 000-255

:ngti= (obsolete)

New global title indicator code. When the ANSI/ITU SCCP Conversion and AMGTT features are ON and the Translated Point Code is of a different network type, the **ngti** parameter specifies whether the new GTI translation format is GTI type 2 or GTI type 4.

Range: 2, 4

:nnai= (obsolete)

New nature of address indicator. This parameter specifies the nature of address indicator that will replace the received nature of address indicator.

Range: 0-127

Default: 0xFFFF

:nnp= (obsolete)

New numbering plan. This parameter specifies the numbering plan that will replace the received numbering plan.

Range: 0-15
Default: 0xFFFF

:npdd= (obsolete)

New prefix digits to be deleted. This parameter specifies the new prefix digits to be deleted that will replace the received prefix digits to be deleted.

Range: 0-21
Default: 0

:npds= (obsolete)

New prefix digits string. This parameter specifies the new prefix digits that will replace the received prefix digits string

Range: 1-21 digits
 If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.
 If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.
Default: No digits

:nsdd= (obsolete)

New suffix digits to be deleted. This parameter specifies the new suffix digits to be deleted that will replace the received suffix digits to be deleted.

Range: 0-21
Default: 0

:nsds= (obsolete)

New suffix digits string. This parameter specifies the new suffix digits string that will replace the received suffix digits string.

Range: 1-21 digits
 If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.
 If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.
Default: No digits

Dependencies

The end address must be greater than or equal to the start address.

The **pcn** parameter format must match the format that was assigned with the **chg-stpopts:npcfnti** parameter.

Point code entries must be full point codes. Partial point codes are not allowed.
